Rev.1.10 Oct 2024

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About This Document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microprocessors (MPUs) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas MPU. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MPU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Hardware	Datasheet	Features, overview, and electrical characteristics
	User's Manual: Hardware	Specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manuals and quick start guides for developing embedded software applications with Software Packages, Development Kits, Starter Kits, Promotion Kits, Product Examples, and Application Examples
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
AAA.BBB.CCC	Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC).
AAA.BBB	A period separated a function module symbol (AAA) and register symbol (BBB).
BBB.DDD	A period separated a register symbol (BBB) and bit field symbol (DDD).
EEE[3:0]	Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms

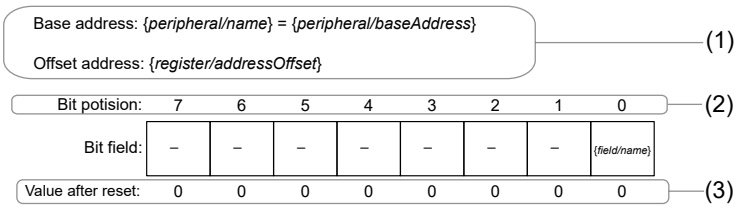
The following terms have special meanings.

Term	Description
NC	Not connected pin. This pin should be left floating unless specified otherwise.
Hi-Z	High impedance.
x	Don't care or undefined.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {*register/name*} : {*register/description*}



(4) (5) (6)

Bit	Symbol	Function	R/W
0	{*field/name*}	{*field/description*} 0: {*enumeratedValue/description*} 1: {*enumeratedValue/description*}	{*access*}
7:1	–	These bits are read as 0. The write value should be 0.	R/W

(1) Function module symbol, register symbol, and address assignment

Function module symbol, {*pheripheral/name*}, register symbol, {*register/name*}, and address assignment of this register are generally expressed. Base address and Offset address mean {*register/name*} : {*register/description*} of {*peripheral/name*} is assigned to address {*peripheral/baseAddress*} + {*register/addressOffset*}.

(2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

(4) Symbol

{*filed/name*} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, {*field/description*}, and enumerated values.

(6) R/W

The R/W column indicates the access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

The abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ATB	Advanced Trace Bus
AXI	Advanced eXtensible Interface
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
CTI	Cross Trigger Interface
DAP	Coresight Debug Access Port
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ECDSA	Elliptic Curve Digital Signature Algorithm
ETM	Embedded Trace Macrocell
JTAG	Joint Test Action Group
LSB	Least Significant Bit
MSB	Most Significant Bit
PLL	Phase Locked Loop
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
S/H	Sample and Hold
SHA	Secure Hash Algorithm
SWD	Serial Wire Debug
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter

User's Manual

600/1200 MHz, Cortex-A55 Quad/Dual/Single MPCore, 500/1000 MHz, Dual Arm® Cortex®-R52 on-chip FPU and NEON™, 2.0 MB of on-chip SRAM, LPDDR4-3200 with 32-bit, Ethernet MAC, EtherCAT, USB 2.0 high-speed, PCI Express Gen3, SD card host interface, CAN/CANFD, various communications interfaces such as an xSPI and ΔΣ interface, encoder interfaces, and security functions

Features

On-chip 64-bit Arm Cortex-A55 processor

- Quad/Dual/Single MPCore cores
- Maximum operating frequency:
  - Core: 600/1200 MHz
  - DSU: 500/1000 MHz
- 64-bit Arm Cortex-A55 Quad/Dual/Single MPCore cores (revision r2p0)
- Address space: 32 Gbytes
- L1 cache:
  - I-cache: 32 Kbytes (with parity)
  - D-cache: 32 Kbytes (with ECC)
- L2 cache: 0 bytes
- L3 cache: 1024 Kbytes (with ECC)
- NEON/FPU supported
- Cryptographic extension supported (Security product only)
- Arm V8.2-A architecture

On-chip 32-bit Arm Cortex-R52 processor

- High-speed realtime control with operating frequency of 500/1000 MHz
- On-chip Dual 32-bit Arm Cortex-R52 (revision r1p4)
- Tightly coupled memory (TCM) with ECC
  - CPU0, CPU1: 512 KB/64 KB
- Instruction cache/data cache with ECC
  - CPU0, CPU1: 16 KB per cache
- High-speed interrupt
- NEON/FPU supported
- Harvard architecture with 8-stage pipeline
- Supports the memory protection unit (MPU)
- Arm CoreSight architecture, includes support for debugging through JTAG and SWD interfaces.
- No DCLS (Dual Core Lock Step) support

Low power consumption

- Standby mode and module stop function

On-chip SRAM

- 2.0 MB of the on-chip SRAM with ECC
- 250 MHz

LPDDR4 SDRAM Memory Interface

- Data transfer: 3.2 Gbps
- Bus width: 32-bit
- Rank: 1, 2
- Size: up to 64 Gb

Data transfer

- DMAC: 16 channels × 3 units

Event link controller

- Module operations can be started by event signals rather than by interrupt handlers.
- Linked operation of modules is available even while the CPU is in the standby state.

Reset and power supply voltage control

- Ten reset sources including a pin reset

Clock functions

- External clock/oscillator input frequency: 25 MHz
- CPU clock frequency: 600/1200 MHz (Cortex-A55), 500/1000 MHz (Cortex-R52)
- System clock frequency: 400 MHz (A-Bus), 250 MHz (R-Bus)
- Low-speed on-chip oscillator (LOCO): 1 MHz

Safety functions

- Register write protection, input clock oscillation stop detection and CRC
- Master Memory Protection Unit (MPU)

Security functions (optional)

- Boot mode with security through encryption
- JTAG authentication
- Cryptologic accelerator
- TRNG
- Cortex-A55 Crypto Extension
- Arm® TrustZone® technology

Encoder interfaces

- 16 channels
- EnDat 2.2, BiSS-C, A-format, and HIPERFACE DSL-compliant interfaces
- Frequency-divided output from an encoder

Various communications interfaces

- Ethernet
  - EtherCAT slave Controller: 3 ports
  - Ethernet switch: 3 ports
  - Ethernet MAC: 1 port × 3 units
- USB 2.0 high-speed host/functions: 1 channel
- CAN/CANFD (compliant with ISO11898-1): 2 channels
- SCI with 16-byte transmission and reception FIFOs: 6 channels + 12 channels (for encoder)
- I2C bus interface: 3 channel for transfer at up to 400 kbps
- SPI: 4 channels
- xSPI: 2 channels
- PCI Express Gen3: 2 lane × 1 port or 1 lane × 2 ports
- SD card host interface: 2 channels

External host interface

- Serial host interface

External address space

- Buses for high-speed data transfer at up to 125 MHz
- Support for up to 4 CS areas
- 8-, 16- or 32-bit bus space is selectable per area

Up to 73 extended-function timers

- 16-bit × 8 + 32-bit MTU3 (9 channels), 32-bit GPT (56 channels)
- 16-bit CMT (6 channels), 32-bit CMTW (2 channels)

ΔΣ interface

- Up to 30 ΔΣ modulators are connectable externally.

Trigonometric function unit

- 2 units
- Simultaneous calculation of sine and cosine
- Simultaneous calculation of arctangent and hypot_k

12-bit A/D converter

- 12 bits × 3 unit (4 channels for unit 0, 1, 15 channels for unit 2)

Temperature sensor for measuring temperature within the chip

LCD Controller

- Support Image Processing (Dither, Clipping, Gamma Correction)
- Parallel output interface
- Output Data Format: RGB666 / RGB888
- Support WXGA (1280 × 800), 60 fps

General-purpose I/O ports

- Input pull-up/pull-down
- The locations of input/output functions for peripheral modules are selectable from among multiple pins.

Operating temperature range

- Tj = -40 to +125°C

1. Overview

1.1 Outline of Specifications

The MPU is a high-performance ASSP that has Cortex-A55 quad MPCore and dual Arm Cortex®-R52 processor with Floating-Point Unit (FPU) and NEON™. It incorporates integrated peripheral functions necessary for system configuration.

Table 1.1 CPU

Feature	Functional description
Arm® Cortex®-A55	• One Processor which consist of Quad/Dual/Single MPCore cores • Operating frequency – Core: 600 MHz/1200 MHz – DSU: 500 MHz/1000 MHz • 64-bit CPU Cortex-A55 designed by Arm (core revision r2p0) • Address space: 32 GB • L1 cache – I-cache: 32 KB (with parity) each core – D-cache: 32 KB (with ECC) each core • L2 cache: 0 bytes • L3 cache: 1024 KB (with ECC) • Arm V8.2-A architecture • NEON/FPU supported • Cryptographic extension supported (Security product only)
Arm® Cortex®-R52	• Two processors which consist of single core • Operating frequency – Each CPU0 and CPU1: 500 MHz/1000 MHz • 32-bit CPU Cortex-R52 designed by Arm (core revision r1p4) • Address space: 4 GB • Instruction cache – Each CPU0 and CPU1: 16 KB (with ECC) • Data cache – Each CPU0 and CPU1: 16 KB (with ECC) • Tightly coupled memory (TCM) – Each CPU0 and CPU1 ATCM: 512 KB (with ECC) 0 wait (500 MHz) / 1 wait (1000 MHz) BTCM: 64 KB (with ECC) 0 wait CTCM: 0 KB • Instruction set: ARMv8-R architecture, so support includes Thumb® and Thumb-2 • Two stage Memory protection unit (MPU) • NEON/FPU supported

Table 1.2 Memory

Feature	Functional description
On-chip system SRAM with ECC	• Capacity: 2.0 MB (512 KB × 4 units) (with ECC) • Operating frequency: 250 MHz • SEC-DED (single error correction/double error detection) Error injection supported
One-time programmable memory	• Overwrite protection • Redundancy support • Available information – Unique ID – Authentication settings – Trimming data – Boot mode setting – User area
LPDDR4 SDRAM memory interface	• Data transfer: 3.2 Gbps • Bus width: 32 bits • Rank: 1, 2 • Size: up to 64 Gb • Inline ECC • No support of LPDDR4X

Table 1.3 System

Feature	Functional description
Operating modes	The operating mode can be selected from the following seven boot modes: ● xSPI0 boot mode (CS0 × 1 boot Serial Flash) ● xSPI0 boot mode (CS0 × 8 boot Serial Flash) ● eMMC boot mode ● SD boot mode ● xSPI1 boot mode (CS0 × 1 boot Serial Flash) ● SCI boot mode ● USB boot mode
Clock generation circuit	● The input clock can be selected from an external clock or external resonator. ● Detection of input clock oscillation stopping ● The following clocks are generated: – Cortex-A55 clock: 600 or 1200 MHz (selectable each core) – Cortex-R52 clock: 500 or 1000 MHz (selectable each unit) – A-Bus clock: 400 MHz – R-Bus clock: 250 MHz – High-speed peripheral module clock A (PCLKAH): 400 MHz – Middle-speed peripheral module clock A (PCLKAM): 200 MHz – Low-speed peripheral module clock A (PCLKAL): 100 MHz – High-speed peripheral module clock R (PCLKH): 250 MHz – Middle-speed peripheral module clock R (PCLKM): 125 MHz – Low-speed peripheral module clock R (PCLKL): 62.5 MHz – ADC clock in the 12-bit A/D converter: 62.5 MHz – External bus clock 125 MHz – Low-speed on-chip oscillator: 1 MHz
Reset	RES# pin reset, software reset, error reset, Cortex-A55 cluster software reset, Cortex-A55 core0 software reset, Cortex-A55 core1 software reset, Cortex-A55 core2 software reset, Cortex-A55 core3 software reset, Cortex-R52 CPU0 software reset, Cortex-R52 CPU1 software reset
Low-power consumption function	● Standby mode (Cortex-A55, Cortex-R52) ● Module stop function
Interrupt controller (ICU)	● Connect an interrupt to the GIC600 for Cortex-A55 ● Connect an interrupt to the GIC (Generic Interrupt Controller) for Cortex-R52 CPU0 and CPU1 ● Connect an activating trigger to the DMAC and ELC ● Peripheral function interrupts: 394 sources ● External interrupts: 16 sources (IRQ0 to IRQ15 pins) ● Software interrupts: 16 sources ● System error interrupts: 1 source ● 32 levels specifiable for the order of priority in the GIC
Bus state controller (BSC)	● The external address space is divided into four areas (CS0, CS2, CS3, and CS5) for management. ● The following features are configurable for each area independently: Bus size (8, 16, or 32 bits): Available sizes depend on the area. Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas). Idle wait cycle insertion (between same area access cycles or different area access cycles). Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface is also available. ● Outputs a chip select signal (CS0# to CS5#) according to the target area (CS assert or negate timing can be selected by software).

Table 1.4 Direct memory access

Feature	Functional description
Direct memory access controller (DMAC)	● 3 units (16 channels each unit) ● Transfer modes: Single transfer mode and block transfer mode ● Transfer size – Unit 0: 1/2/4/8/16/32/64 bytes – Unit 1, 2: 1/2/4/8/16/32 bytes ● Activation sources: Software trigger, external DMA requests (DREQ), external interrupts, and interrupt requests from peripheral functions

Table 1.5 I/O Ports

Feature	Functional description
General-purpose I/O ports	● 729-pin FCBGA – I/O pins: 287 – Input pins: 0 – Pull-up/pull-down resistors: 287 ● 576-pin FCBGA – I/O pins: 189 – Input pins: 0 – Pull-up/pull-down resistors: 189 ● The locations of input/output functions are selectable from among multiple pins.

Table 1.6 Event link

Feature	Functional description
Event link controller (ELC)	● Up to 648 event signals can be interlinked with the operation of modules. ● In particular, the operation of timer modules can be started by input event signals. ● Event-linked operation of signals of ports 14 and port 30 is to be possible.

Table 1.7 Timers (1 of 2)

Feature	Functional description
Multi-function timer pulse unit 3 (MTU3)	● 9 channels (16 bits × 8 channels, 32 bits × 1 channel) ● Maximum of 28 pulse-input/output and 3 pulse-input possible ● Select from among 10, 11, 12, or 14 counter-input clock signals for each channel (with maximum operating frequency of 250 MHz) ● Input capture function ● 39 output compare/input capture registers ● Counter clear operation (synchronous clearing by compare match/input capture) ● Simultaneous writing to multiple timer counters (TCNT) ● Simultaneous register input/output by synchronous counter operation ● Buffered operation ● Support for cascade-connected operation ● Automatic transfer of register data ● Pulse output mode Toggle/PWM/complementary PWM/reset-synchronized PWM ● Complementary PWM output mode – Outputs non-overlapping waveforms for controlling 3-phase inverters – Automatic specification of dead times – PWM duty cycle: Selectable as any value from 0% to 100% – Delay can be applied to requests for A/D conversion. – Non-generation of interrupt requests at peak or trough values of counters can be selected. – Double buffer configuration ● Reset synchronous PWM mode Six phases of positive and negative PWM waveforms can be output with desired duty cycles. ● Phase-counting mode: 16-bit mode (channels 1 and 2), 32-bit mode (channels 1 and 2 in cascade connection) ● Counter functionality for dead-time compensation ● Generation of triggers for A/D converter conversion ● A/D converter start triggers can be skipped ● Digital noise filter function for signals on the input capture and external counter clock pins ● Event linking by the ELC

Table 1.7 Timers (2 of 2)

Feature	Functional description
General PWM timer (GPT)	• 32 bits × 56 channels (5 channels × 9 units + 7 channels × 1 unit + 4 channels × 1 unit) • Counting up or down (saw-wave), counting up and down (triangle-wave) selectable for all channels • Select from among four counter-input clock signals for each channel (with maximum operating frequency of 500 MHz for LLPP) • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Synchronizable operation of the several counters • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Through combination of 3 counters, generation of automatic 3-phase PWM waveforms incorporating dead times • Starting, clearing, stopping, switching, up/down counters, and input capture in response to external or internal triggers • Starting, clearing, stopping, switching, up/down counters, and input capture in response to input level comparison • Internal trigger sources: software and compare-match • Generation of triggers for A/D converter conversion • Digital noise filter function for signals on the input capture and external trigger pins • Event linking by the ELC • Function of output duty 0% and 100% is selectable from troughs or crests/troughs.
Compare match timer (CMT)	• (16 bits × 2 channels) × 3 units • Select from among four counter-input clock signals for each channel
Compare match timer W (CMTW)	• (32 bits × 1 channel) × 2 units • Compare-match, input-capture input, and output-comparison output are available. • Select from among four counter-input clock signals for each channel • Interrupt requests can be output in response to compare-match, input-capture, and output-comparison events.
Watchdog timer (WDT)	• 14 bits × 6 channels • Select from among six counter-input clock signals for each channel
Port output enable 3 (POE3)	• Control of the high-impedance state of the MTU3 waveform output pins • 5 pins for input from signal sources: POE0#, POE4#, POE8#, POE10#, POE11# • Initiation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) • Initiation by input clock oscillation-stoppage detection, PLL oscillation anomaly detection, two types of DSMIF error detection, or software • Additional programming of output control target pins is enabled
Port output enable for GPT (POEG)	• Controlling the output disable for GPT waveform output • Initiation by input level detection of GTETRG pins • Initiation by output disable request from GPT • Initiation by detection of oscillation stop, two types of DSMIF error detection, or by software
Real time clock (RTC)	• A 100 year calendar from 2000 to 2099 • BCD code display • Clock source is division of main oscillator. • Automatic adjustment function for leap years

Table 1.8 Communication interfaces (1 of 3)

Feature	Functional description
Ethernet MAC (GMAC)	• 1 port × 3 units • IEEE802.3 • IEEE1588-2008 • IEEE802.3-az-2010 for EEE • Support for 10/100/1000 Mbps data transfer • Full duplex and half duplex are supported • Programmable frame length to support both standard and jumbo frames up to 16 KB • 32 MAC address registers for the address filter block • Variety of flexible addresses filtering modes are supported • Advanced IEEE 1588-2002 & 2008 Ethernet frame time-stamping supported • MII/RMII/RGMII interface is supported by RMII/RGMII converter • TSN features (IEEE802.1Qbv, IEEE802.1Qbu/802.3br) • Multi queues support up to 8 RX and 8 TX queues • DMA channels: 8 RX and 8 TX channels • VLAN Filtering, L3 and L4 Filtering
Ethernet switch (ETHSW)	• 3-port PHY interfaces • IEEE802.3 • Support for 10/100/1000 Mbps data transfer • Full and half duplex (1000 Mbps supports full-duplex only) • Hardware switching, lookup, and filtering • QoS with frame prioritization • Priority control based on VLAN Priority (IEEE802.1q), which enables priority reassignment • Classification and priority assignment based on IPv4 DiffServ Code Point Field, IPv6 Class of Service • Queue with eight priority levels • Multicasting and broadcasting • VLAN frame • IEEE 1588-2008 compatible • Programmable addition, removal and manipulation of ingress and egress VLAN tags, supporting single and double-tagged VLAN frames on each port • Cut-through and hub features • Device level ring (DLR) • Programmable egress rate limit per port • Ingress Configurable Broadcast/multicast storm protection per port • IEEE802.1X source address authentication supported • IEEE802.1X guest VLAN supported • PRP functionality (IEC 62439-3 edition 2.0- 2012) • Configurable Time Multiplexed (TDMA) output queue scheduler supporting real-time network infrastructures using time slots for bandwidth reservation enabling deterministic delays • Frame preemption • Cyclic queuing and forwarding • Forwarding rule for the TSN-IA profile • A MAC source address filtering • Pattern matchers 12 channels • Independent two timer module are available for timestamping and time for TDMA. • Remote monitoring through SNMP • Powerlink capable hub • Ingress filtering and frame header manipulation (active stream identification, flow metering) with Enhanced Frame Parser • 4 additional PTP timer pulse generators • MII/RMII/RGMII interface is supported by RMII/RGMII converter
EtherCAT slave controller (ESC)*1	• 1 channel (3 ports) • EtherCAT Slave Controller IP core (made by Beckhoff Automation GmbH) implemented • MII interface is supported. RMII/RGMII interface is supported by RGMII converter in Ethernet Subsystem.
USB 2.0 HS host/function module	• 1 port • Compliance with the USB 2.0 specification • OTG support • Transfer rate High speed (480 Mbps), full speed (12 Mbps), low speed (1.5 Mbps, host only) • Communications buffer – Incorporates 1 KB of RAM for host mode – Incorporates 8 KB of RAM for function mode • DMAC (2 channels) incorporated

Table 1.8 Communication interfaces (2 of 3)

Feature	Functional description
Serial communication interface (SCI)	• 6 channels + 12 channels (for encoder) • 6 communication mode – Asynchronous interfaces – 8-bit clock synchronous interface – Simple I^2C (master-only) – Simple SPI – Smart card interface – Manchester mode (For channel for encoder, Simple I^2C, Simple SPI, and Smart card interface mode are not supported.) • Clock source is select from among four internal clock signals • Bit rate specifiable with the on-chip baud rate generator • Full-duplex and half-duplex communication • Data length: 7 to 9 bits (Asynchronous mode) • Bit rate modulation • Double speed mode (Asynchronous, Clock Synchronous, Simple SPI mode, Manchester mode) • RS-485 driver control function (Asynchronous mode) • Loopback function to enable self-diagnosis (Asynchronous, Clock synchronous mode)
I^2C bus interface (IIC)	• 3 channels • Communication formats: I^2C bus format or SMBus format • Master or slave mode selectable • Supports the multi-master • Maximum transfer rate: 400 kbps (Standard mode and Fast mode)
CAN-FD module (CANFD)	• 2 channels • Comply with CAN-FD ISO 11898-1 (2015) • Communication speed – Classical CAN mode: 1 Mbps – CAN FD mode: Nominal bit rate: max. 1 Mbps Data bit rate: max. 8 Mbps • Total 192 message buffers (in case frame size is 76 bytes) – Individual buffers: 64 for TX – Shared buffers: 128 for TX and RX including FIFO • Selectable ID type with 11-bit Standard and 18-bit Extended • Selectable Frame type: Data Frame and Remote Frame • Up to 256 receive rules
Serial peripheral interface (SPI)	• 4 channels • SPI transfer facility Using the MOSI (master out slave in), MISO (master in slave out), SSL (slave select), and RSPCK (SPI clock) signals enables serial transfer through SPI operation (four lines) or clock-synchronous operation (three lines) capable of handling serial transfer as a master or slave • Data formats – Switching between MSB first and LSB first – Transfer bit length selectable to 4 - 32 bits – 32 bits × 4-stage FIFO transmit and receive buffers – Up to four frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits) • RSPCK can be stopped automatically with the reception buffer full for master reception

Table 1.8 Communication interfaces (3 of 3)

Feature	Functional description
Expanded serial peripheral interface (xSPI)	• 2 channels • Comply with JESD251 • Multiple slave up to 2 slaves • Protocol mode: 1/4/8pin with SDR/DDR 1S-1S-1S, 4S-4D-4D, 8D-8D-8D • Support OctaFlash, OctaRAM, HyperFlash and HyperRAM • Protocol mode: 2/4pin with SDR compatible with QSPI 1S-2S-2S, 2S-2S-2S 1S-4S-4S, 4S-4S-4S • Configurable address length • Configurable initial access latency cycle • Support XiP mode • Support up to 256 MB address space • Prefetch function for burst-read with low latency • Outstanding buffer for burst-write with high throughput • Manual command configurable up to 4 commands • Output clock/input strobe port timing shift • Automatic command after released reset: up to 4 commands
SD/eMMC Host Interface (SDHI)	• SD memory/IO card interface (1-bit/4-bit SD bus) • SD, SDHC, and SDXC SD memory card access supported • Default, high-speed, UHS-I/SDR12, SDR25, SDR50, SDR104, and DDR50 transfer modes supported • Error check function: CRC7 (for command/response), CRC16 (for data) • Card detect function • Write protect supported • MMC interface (1-/4-/8-bit MMC bus) • e-MMC device access supported • Backward-compatible, high-speed (SDR/DDR), and HS200 transfer modes supported • High-priority interrupt (HPI) supported
PCI Express Gen3 (PCIE)	• PCI Express Gen1 (2.5 [GT/s]) / Gen2 (5.0 [GT/s]) / Gen3 (8.0 [GT/s]) • Root Complex / Endpoint Applications, Type 0/1 Configuration Register • Lane/Port: 1 lane × 2 ports or 2 lanes × 1 port selectable • Support Polarity inversion • Maximum data payload of 256 bytes, Maximum read request size 512 bytes • Number of outstanding 1-8 • Dynamic control of speed/width up/down configuration • Power Management (not support ASPM L1-Substate) • Error handling/logging (AER Support) • Replay FIFO with ECC • Number of Support Functions 2

Note 1. EtherCAT is a registered trademark of Beckhoff Automation GmbH, Germany.

Table 1.9 Analog

Feature	Functional description
12-bit A/D converter (ADC12)	• 12 bits × 3 units (unit 0, 1: 4 channels, unit 2: 15 channels) • 12-bit resolution • Conversion time 0.32 µs per channel • Operating mode Scan mode (single scan mode, continuous scan mode, or 3 group scan mode) Group priority control • Sample-and-hold function Common sample-and-hold circuit included In addition, channel-dedicated sample-and-hold function (3 channels: in all units) included • Sampling variable Sampling time can be set up for each channel • Double trigger mode (A/D conversion data duplicated) • Three ways to start A/D conversion Software trigger, timer (MTU3, ELC) trigger, external trigger • Event linking by the ELC
Temperature sensor unit (TSU)	• 1 channel • Relative precision: ±2°C (typ)

Table 1.10 Hardware accelerator for industrial interfaces

Feature	Functional description
ΔΣ interface (DSMIF)	• 3 channels × 10 units • Selectable 2 inputs (U/V) or 3 inputs (U/V/W) • Up to 6 ΔΣ modulators are externally connectable • Sinc filter can be selected as first, second or third order • Direct error connection to POE3 and POEG • Enhancement of current error detection • Core clock: 250 MHz/400 MHz selectable
Trigonometric function unit (TFU)	• 2 units • Calculation of sine, cosine, arctangent, hypot_k ($\sqrt{x^2+y^2}/k$) • Simultaneous calculation of sine and cosine • Simultaneous calculation of arctangent and hypot_k
Encoder interfaces	• EnDat 2.2 (16 units) • BiSS-C (16 units) • A-format (16 units) • HIPERFACE DSL (16 units) • ENCOUT (1 unit)

Table 1.11 Safety

Feature	Functional description
Memory protection unit (MPU)	• Cortex-R52 MPU Two stages MPUs (EL2 and EL1) 24 regions each MPU • Master MPU Memory protection for masters except Cortex-A55 and Cortex-R52 (DMAC, USB, Ethernet MAC, CoreSight, SHOSTIF, LCDC, SDHI, PCIE)
Register write protection function	Protects important registers from being overwritten for in case a program runs out of control.
CRC calculator (CRC)	• 2 channels • CRC code generation for arbitrary amounts of data in 8-, 16-, or 32-bit units • Select any of five generating polynomials: – $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (32-Ethernet) – $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C) – $X^{16} + X^{15} + X^2 + 1$ (CRC-16) – $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT) – $X^8 + X^2 + X + 1$ (CRC-8)
Clock monitor circuit (CLMA)	• Monitors the abnormal output clock frequency from the input clock (main clock oscillator), PLL circuit, or low-speed on-chip oscillator. • Input clock oscillation stop detection: Available
Data operation circuit (DOC)	The function to compare, add, or subtract 16-bit data
Isolated peripherals	• Safety dedicated peripherals are available: – GPT: 4 ch – SCI: 1 ch – IIC: 1 ch – SPI: 1 ch – CRC: 1 unit – RTC: 1 unit – GPIO: Sharable with normal GPIO – On-chip system SRAM with ECC • They are mapped independently from normal peripherals so that access protection can be done by EL2 MPU.

Table 1.12 Security

Feature	Functional description
Security*1	• Secure boot • JTAG authentication • SCI/USB boot authentication • Cryptographic accelerators – Symmetric Cipher: AES 128/192/256 bits with CBC/ECB/CTR/GCM/XTS – Asymmetric Cipher: ECC 256 bits, RSA 1024/2048/3072 bits, RSAES-OAEP – Hash: SHA-1, SHA-2 – Message authentication: HMAC, CMAC, GMAC – Signature algorithms: ECDSA with NIST P-256, RSASSA-PSS, RSASSA-PKCS1 • TRNG • Cortex-A55 Crypto Extension • Arm® TrustZone® technology

Note 1. For details, contact our sales representative.

Table 1.13 Debug

Feature	Functional description
Debugging interface	• CoreSight architecture designed by Arm • Debugging function by the JTAG/SWD interface, and trace function by ETF and system bus by ETR

Table 1.14 External host interface

Feature	Functional description
Serial host interface (SHOSTIF)	• Serial communication is possible in slave mode. • Supported interface – Motorola Serial Peripheral Interface (4-wire SPI) – Enhanced SPI Modes with Dual, Quad, or Octal SPI • Serial clock polarity switching • Serial clock phase switching • Single Data Transfer • Data size is up to 32 bits × 64 burst
Mailbox and semaphore (MBXSEM)	• Eight semaphores for external host CPU and Cortex-A55/Cortex-R52 • Four 32-bit mailboxes for both external host CPU to Cortex-A55/Cortex-R52 and Cortex-A55/Cortex-R52 to external host CPU • Interrupts can be generated and cleared from both external host CPU and Cortex-A55/Cortex-R52 • Semaphores and Mailboxes with exclusive access among Cortex-A55, Cortex-R52 CPU0 and CPU1.

Table 1.15 Display interface

Feature	Functional description
LCD Controller (LCDC)	• 2 planes blending (can blend 2 different size images) • Support Image Processing: – Dither processing (RGB666) – Clipping – RGB Gamma Correction LUT • Support Input Data Format: – RGB565 / RGB666 / RGB888 – ARGB1555 / ARGB4444 / ARGB8888 – YcbCr444 8-bit / YcbCr422 8-bit / YcbCr420 8-bit • Support WXGA (1280 × 800), 60 fps • Support Output Data Format: – RGB666 / RGB888 • CLK / HD / VD timing signal supported

Table 1.16 Others

Feature	Functional description
Power supply voltage	0.8 V: Core (Digital and Analog (PLL, TSU, OTP, USB, PCIE, ADC)) 1.1 V: DDR 1.8 V: PLL, OSC, USB, ADC, TSU, OTP, PCIE, DDR, RGMII 3.3 V: GPIO (in 3.3 V fixed domain), USB, OSC, RMII/MII, other peripherals 1.8 V/3.3 V selectable: xSPI, SDHI, GPIO (in 1.8 V/3.3 V selectable domains)
Operating temperature	Tj = −40 to +125°C
Packages	RZ/T2H: 729 pin FCBGA 23 × 23 mm, 0.8-mm pitch RZ/N2H: 576 pin FCBGA 21 × 21 mm, 0.8-mm pitch

1.2 Function Comparison

Table 1.17 Function comparison (1 of 2)

Module/Function		RZ/T2H (729-pin FCBGA)	RZ/N2H (576-pin FCBGA)
CPU	ARM Cortex-A55	Quad/Dual/Single	
	ARM Cortex-R52	Two	
Memory	System SRAM	2.0 MB	
External bus	External bus width	32 bits	
Interrupt	External interrupt	SEI, IRQ0 to IRQ15	
DMA	DMA controller (DMAC)	3 units (16 channels each unit)	
Timer	Multi-function timer pulse unit 3 (MTU3)	1 unit (9 channels)	
	General PWM timer (GPT)	11 units (56 channels)	11 units (56 channels)*1
	Compare match timer (CMT)	3 units (6 channels)	
	Compare match timer W (CMTW)	2 channels	
	Watchdog timer	6 channels	
	Port output enable 3 (POE3)	1 unit	
	Port output enable for GPT (POEG)	3 unit	
	Real time clock (RTC)	1 unit	
Communication function	Ethernet MAC (GMAC)	3 units	3 units*1
	Ethernet switch (ETHSW)	1 unit (3 external ports)	1 unit (3 external ports)*1
	EtherCAT slave controller (ESC)	1 unit (3 external ports)	
	USB 2.0 HS host/function module (USB)	1 unit (1 port)	
	Serial communication interface (SCI, SCIE)	6 channels + 12 channels	
	I2C bus interface (IIC)	3 channels	
	CANFD module (CANFD)	2 channels	
	Serial peripheral interface (SPI)	4 channels	4 channels*1
	Expanded serial peripheral interface (xSPI)	2 channels	2 channels*1
	PCI Express Gen3 (PCIE)	1 unit (1 lane × 2 ports or 2 lanes × 1 port)	
	SD/eMMC Host Interface (SDHI)	2 channels	
12-bit A/D converter (ADC12)		3 units (4 channels for unit 0 and unit 1, 6 channels for unit 2)	3 units (4 channels for unit 0 and unit 1, 15 channels for unit 2)
Temperature sensor unit (TSU)		1 unit	
ΔΣ interface (DSMIF)		10 units (30 channels)	8 units (23 channels)*2
Trigonometric function unit (TFU)		2 units	
Encoder I/F	EnDat 2.2 (ENDAT)	16 units	14 units*3
	BiSS-C (BISS)	16 units	14 units*3
	A-format (AFMT)	16 units	14 units*3
	Hiperface DSL (HDSL)	16 units	14 units*1 *3
	ENCOUT	1 unit	1 unit
CRC calculator (CRC)		2 channels	
Clock monitor circuit (CLMA)		7 units	
Data operation circuit (DOC)		1 unit	
Security*4		Optional	

Table 1.17 Function comparison (2 of 2)

Module/Function	RZ/T2H (729-pin FCBGA)	RZ/N2H (576-pin FCBGA)
One-time programmable memory (OTP)	Available	
Serial host interface	1 unit	
Mailbox and semaphore (MBXSEM)	Available	
Event link controller (ELC)	Available	
LPDDR4 SDRAM Subsystem (DDRSS)	32 bits	
LCD Controller (LCDC)	1 unit	

Note 1. A part of external signals are not available.
Note 2. Unit 6, 9 and ch 2 of unit 8 are not available due to lack of mandatory external signals.
Note 3. Unit 8 and 15 are not available due to lack of mandatory external signals.
Note 4. For details, contact our sales representative.

1.3 Product Lineup

Table 1.18 shows a product lineup.

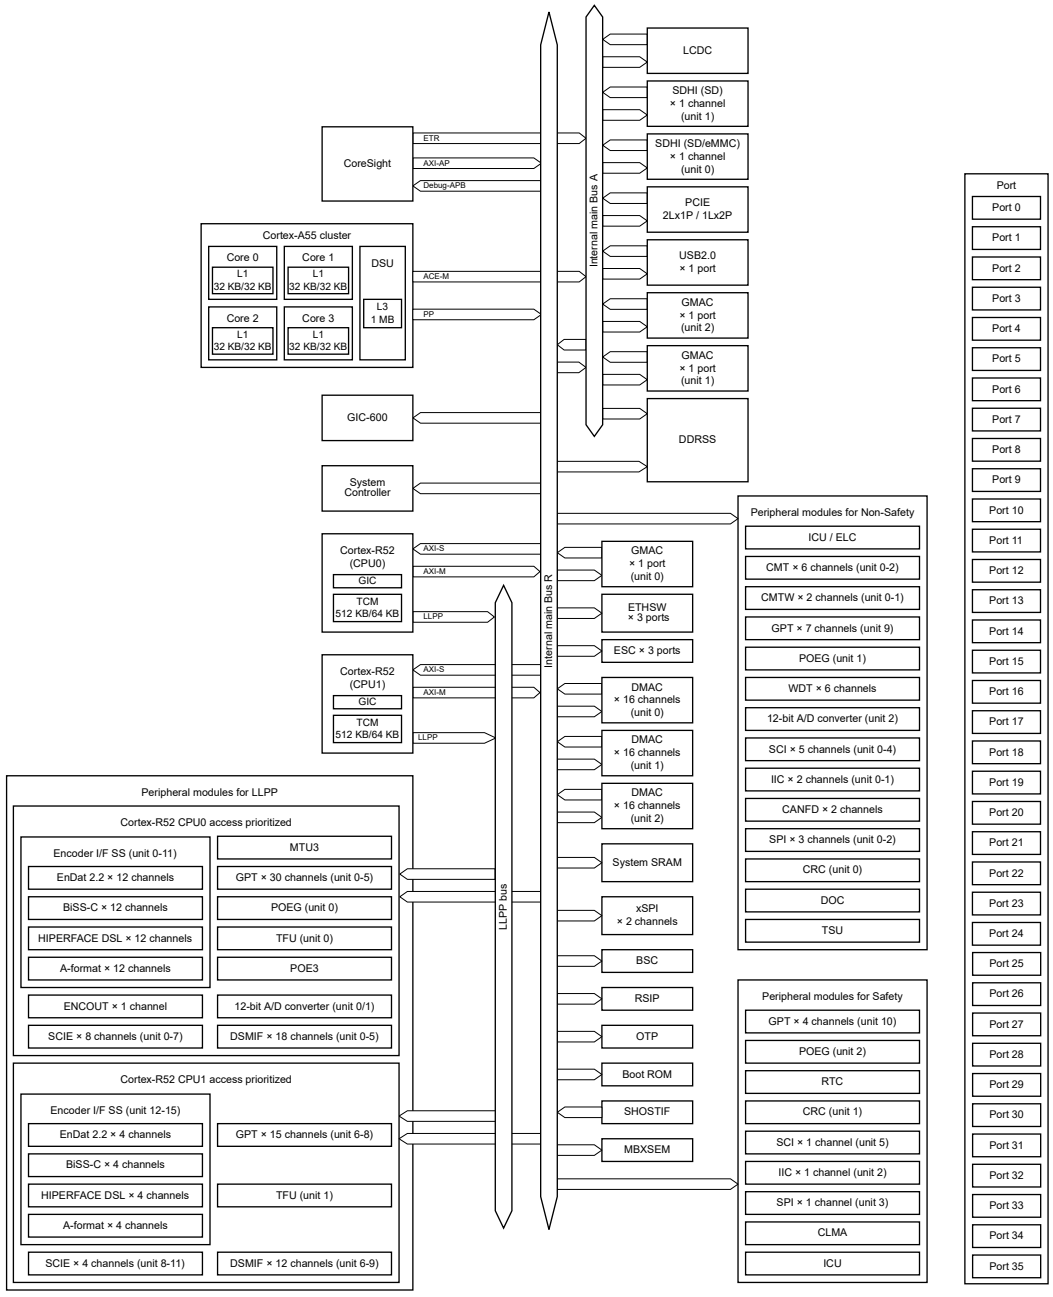
Table 1.18 Product lineup

Product	Part Number	Package	Cortex-A55	Cortex-R52	Security*1
RZ/T2H	R9A09G077M48GBG	729-pin FCBGA	Quad cores	Two CPUs	Available
	R9A09G077M28GBG	729-pin FCBGA	Dual cores	Two CPUs	Available
	R9A09G077M08GBG	729-pin FCBGA	Single core	Two CPUs	Available
	R9A09G077M44GBG	729-pin FCBGA	Quad cores	Two CPUs	Not available
	R9A09G077M24GBG	729-pin FCBGA	Dual cores	Two CPUs	Not available
	R9A09G077M04GBG	729-pin FCBGA	Single core	Two CPUs	Not available
RZ/N2H	R9A09G087M48GBG	576-pin FCBGA	Quad cores	Two CPUs	Available
	R9A09G087M28GBG	576-pin FCBGA	Dual cores	Two CPUs	Available
	R9A09G087M08GBG	576-pin FCBGA	Single core	Two CPUs	Available
	R9A09G087M44GBG	576-pin FCBGA	Quad cores	Two CPUs	Not available
	R9A09G087M24GBG	576-pin FCBGA	Dual cores	Two CPUs	Not available
	R9A09G087M04GBG	576-pin FCBGA	Single core	Two CPUs	Not available

Note 1. Except for TrustZone. TrustZone is available for all part number.

1.4 Block Diagram

Figure 1.1 shows a block diagram.



GMAC	: Ethernet MAC
ETHSW	: Ethernet switch
ESC	: EtherCAT slave controller
DMAC	: DMA controller
BSC	: Bus state controller
xSPI	: Expanded serial peripheral interface
WDT	: Watchdog timer
SCI	: Serial communication interface
SCIE	: Serial communication interface for encoder
SPI	: Serial peripheral interface
USB	: USB 2.0 HS host/function module
GIC	: Generic interrupt controller
ELC	: Event link controller
MTU3	: Multi-function timer pulse unit 3
SHOSTIF	: Serial host interface
MBXSEM	: Mailbox and Semaphore
SDHI	: SD/eMMC host interface
PCIE	: PCI Express Gen 3
GPT	: General PWM timer
CMT	: Compare match timer
CMTW	: Compare match timer W
POE3	: Port output enable 3
POEG	: Port output enable for GPT
RTC	: Real time clock
IIC	: I^2C bus interface
CANFD	: CANFD module
DSMIF	: ΔΣ interface
TFU	: Arithmetic unit for trigonometric functions
CRC	: CRC (cyclic redundancy check) calculator
CLMA	: Clock monitor circuit
DOC	: Data operation circuit
TSU	: Temperature sensor unit
RSIP	: Renesas Security IP
OTP	: One-time programmable memory
LCDC	: LCD Controller
DDRSS	: LPDDR4 SDRAM memory interface

1.5 Pin Functions

Table 1.19 lists the pin functions.

Table 1.19 Pin functions (1 of 10)

Classification	Pin name	I/O	Description
Power supply	VDD33	Input	3.3 V power supply pin for I/O
	VDD1833_0 to VDD1833_7	Input	Power supply pins for each I/O domains. (1.8 V or 3.3 V) VDD1833_0: ETH0 domain VDD1833_1: ETH1 domain VDD1833_2: ETH2 domain VDD1833_3: ETH3 domain VDD1833_4: xSPI0 domain VDD1833_5: xSPI1 domain VDD1833_6: SDHI0 domain VDD1833_7: SDHI1 domain
	VDDP_18_33, VDDP_18_0 to VDDP18_7	Input	1.8 V power supply pins for I/O
	VDD08	Input	0.8 V power supply pin.
	VDD18_PLL0 to VDD18_PLL4	Input	1.8 V power supply pins for PLL
	VDD08_PLL0 to VDD08_PLL4	Input	0.8 V power supply pins for PLL
	VDD33_X	Input	3.3 V power supply pin for Oscillator
	VDDP_18_X	Input	1.8 V power supply pin for Oscillator
	AVDD18A_TSU	Input	1.8 V power supply pin for Thermal sensor
	DVDD08A_TSU	Input	0.8 V power supply pin for Thermal sensor
	OTPVDD18	Input	1.8 V power supply pin for OTP
	OTPVDD08	Input	0.8 V power supply pin for OTP
	VSS	Input	Ground pin. Connect to the system power supply (0 V).
	VSS_PLL0 to VSS_PLL4	Input	Ground pin for PLL. Connect to the system power supply (0 V).
Clock	XTAL	Output	Connected to a crystal resonator. When external clock signal is used, EXTAL pin should be driven low. XTAL pin should never be driven or loaded by anything other than crystal oscillator. The voltage level of EXTAL must not exceed VDD18 (1.8 V).
	EXTAL	Input	
	EXTCLKIN	Input	Inputs the external clock. When a crystal resonator is connected, it should be driven low.
	XTALSEL	Input	Main clock source select pin (low: EXTCLKIN, high: XTAL/EXTAL)
	CKIO	Output	Outputs the external bus clock for external devices.
	ETH0_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 0
	ETH1_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 1
	ETH2_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 2
	ETH3_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 3
	RMII0_REFCLK	Output	Outputs 50 MHz clock for RMII0
	RMII1_REFCLK	Output	Outputs 50 MHz clock for RMII1
	RMII2_REFCLK	Output	Outputs 50 MHz clock for RMII2
	RMII3_REFCLK	Output	Outputs 50 MHz clock for RMII3

Table 1.19 Pin functions (2 of 10)

Classification	Pin name	I/O	Description
Operating mode control	MDX	Input	This signal should be driven low.
	MD0 to MD2	Input	Input the operating mode select signal. The signal level on these pins must not be changed during operation mode transition on release from the reset state.
	MDV	Input	Input the operating voltage select signal for boot peripheral. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
	MDW0, MDW1	Input	Input the ATCM wait cycle select signal. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
	MDD	Input	Input the enabling JTAG authentication by hash signal. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES#	Input	Inputs the reset signal. This MPU enters the reset state when this signal goes low.
	BSCANP	Input	Inputs the boundary scan enable signal. Boundary scan is enabled when this pin goes high. When boundary scan is not used, this pin should be driven low.
	RSTOUT#	Output	Outputs the reset signal externally
Debugging interface	TRST#	Input	Test reset pin for the on-chip emulator
	TMS	I/O	Test mode select pin for the on-chip emulator Functions as the SWDIO pin in serial wire debug (SWD) mode
	TDI	Input	Test data input pin for the on-chip emulator
	TDO	Output	Test data output pin for the on-chip emulator
	TCK	Input	Test clock pin for the on-chip emulator Functions as the SWCLK pin in serial wire debug (SWD) mode
Bus state controller (BSC)	A25 to A0	Output	Output the address
	D31 to D0	I/O	Input and output the data
	CS0#, CS2#, CS3#, CS5#	Output	Output the chip select signal for the external memory or device.
	RD#	Output	Outputs the strobe signal which indicates a read is in progress.
	RD/WR#	Output	Outputs the strobe signal which indicates a read or write access
	BS#	Output	Outputs the status signal which indicates the start of the bus cycle
	AH#	Output	Outputs the address hold signal for the device that uses the multiplexed I/O interface
	WAIT#	Input	Inputs the external wait control signal which inserts a wait cycle into the bus cycle
	WE0#	Output	Outputs the write strobe signal to D7 to D0
	WE1#	Output	Outputs the write strobe signal to D15 to D8
	WE2#	Output	Outputs the write strobe signal to D23 to D16
	WE3#	Output	Outputs the write strobe signal to D31 to D24

Table 1.19 Pin functions (3 of 10)

Classification	Pin name	I/O	Description
Direct memory access controller (DMAC)	DREQ	Input	Inputs the DMA transfer request signal from the external device
	DACK	Output	Outputs the acknowledge signal which indicates acceptance of the DMA transfer request from the external device
	TEND	Output	Outputs the DMA transfer end signal
Interrupt	SEI	Input	Input the system error interrupt signal
	IRQ0 to IRQ15	Input	Input the external interrupt request signal
Multi-function timer pulse unit 3 (MTU3)	MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D	I/O	TGRA0 to TGRD0 input capture input, output compare output, and PWM output pins
	MTIOC1A, MTIOC1B	I/O	TGRA1 and TGRB1 input capture input, output compare output, and PWM output pins
	MTIOC2A, MTIOC2B	I/O	TGRA2 and TGRB2 input capture input, output compare output, and PWM output pins
	MTIOC3A, MTIOC3B, MTIOC3C, MTIOC3D	I/O	TGRA3 to TGRD3 input capture input, output compare output, and PWM output pins
	MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D	I/O	TGRA4 to TGRD4 input capture input, output compare output, and PWM output pins
	MTIC5U, MTIC5V, MTIC5W	Input	TGRU5, TGRV5, and TGRW5 input capture input and dead time compensation input pins
	MTIOC6A, MTIOC6B, MTIOC6C, MTIOC6D	I/O	TGRA6 to TGRD6 input capture input/output compare output/PWM output pins
	MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D	I/O	TGRA7 to TGRD7 input capture input/output compare output/PWM output pins
	MTIOC8A, MTIOC8B, MTIOC8C, MTIOC8D	I/O	TGRA8 to TGRD8 input capture input/output compare output/PWM output pins
	MTCLKA, MTCLKB, MTCLKC, MTCLKD	Input	External clock input pins for MTU3
Port output enable 3 (POE3)	POE0#, POE4#, POE8#, POE10#, POE11#	Input	Input the request signal to place the MTU3 in the high-impedance state

Table 1.19 Pin functions (4 of 10)

Classification	Pin name	I/O	Description
General PWM timer (GPT)/ Port output enable for GPT (POEG)	GTETRGA, GTETRGB, GTETRGC, GTETRGD	Input	External trigger input and output-disable request input pins
	GTETRGSA, GTETRGSB	Input	External trigger input and output-disable request input pins (SAFETY)
	GTIOC00_0A to GTIOC00_4A, GTIOC00_0B to GTIOC00_4B, GTIOC01_0A to GTIOC01_4A, GTIOC01_0B to GTIOC01_4B, GTIOC02_0A to GTIOC02_4A, GTIOC02_0B to GTIOC02_4B, GTIOC03_0A to GTIOC03_4A, GTIOC03_0B to GTIOC03_4B, GTIOC04_0A to GTIOC04_4A, GTIOC04_0B to GTIOC04_4B, GTIOC05_0A to GTIOC05_4A, GTIOC05_0B to GTIOC05_4B, GTIOC06_0A to GTIOC06_4A, GTIOC06_0B to GTIOC06_4B, GTIOC07_0A to GTIOC07_4A, GTIOC07_0B to GTIOC07_4B, GTIOC08_0A to GTIOC08_4A, GTIOC08_0B to GTIOC08_4B, GTIOC09_0A to GTIOC09_6A, GTIOC09_0B to GTIOC09_6B, GTIOC10_0A to GTIOC10_3A, GTIOC10_0B to GTIOC10_3B	I/O	Input capture input/output compare output/PWM output pins
	GTADSM00_0 to GTADSM00_1, GTADSM01_0 to GTADSM01_1, GTADSM02_0 to GTADSM02_1, GTADSM03_0 to GTADSM03_1, GTADSM04_0 to GTADSM04_1, GTADSM05_0 to GTADSM05_1, GTADSM06_0 to GTADSM06_1, GTADSM07_0 to GTADSM07_1, GTADSM08_0 to GTADSM08_1, GTADSM09_0 to GTADSM09_1	Output	Output pins for monitoring A/D conversion start requests
Compare match timer W (CMTW)	CMTW0_TIC0, CMTW0_TIC1, CMTW1_TIC0, CMTW1_TIC1	Input	CMTW input capture input pins
	CMTW0_TOC0, CMTW0_TOC1, CMTW1_TOC0, CMTW1_TOC1	Output	CMTW output compare output pins
Real time clock (RTC)	RTCAT1HZ	Output	RTC 1 Hz output pin

Table 1.19 Pin functions (5 of 10)

Classification	Pin name	I/O	Description
Serial communication interface (SCI)	SCK0 to SCK5	I/O	Clock I/O pins (clock synchronous mode/simple SPI mode/smart card mode)
	RXD0 to RXD5	Input	Input the receive data (asynchronous mode/clock synchronous mode/smart card mode)
	TXD0 to TXD5	Output	Output the transmit data (asynchronous mode/clock synchronous mode/smart card mode)
	CTS0# to CTS5#	Input	Input the start of transmission (asynchronous mode/ clock synchronous mode) active-low
	RTS0# to RTS5#	Output	Output the reception (asynchronous mode/clock synchronous mode) active-low
	SCL0 to SCL5	I/O	Input/output the I2C clocks (simple I2C mode)
	SDA0 to SDA5	I/O	Input/output the I2C data (simple I2C mode)
	MISO0 to MISO5	I/O	Input/output the data for slave transmission (simple SPI mode)
	MOSI0 to MOSI5	I/O	Input/output the data for master transmission (simple SPI mode)
	SS0# to SS5#	Input	Chip-select input pins (simple SPI mode) active-low
	DE0 to DE5	Output	Driver enable output pins (asynchronous mode)
Serial communication interface for Encoder (SCIE)	SCKE00 to SCKE11	Output	Clock I/O pins (clock synchronous mode)
	RXDE00 to RXDE11	Input	Input the receive data (asynchronous mode/clock synchronous mode)
	TXDE00 to TXDE11	Output	Output the transmit data (asynchronous mode/clock synchronous mode)
	DEE00 to DEE11	Output	Driver enable output pins (asynchronous mode)
I^2C bus interface (IIC)	IIC_SCL0 to IIC_SCL2	I/O	Clock I/O pins
	IIC_SDA0 to IIC_SDA2	I/O	Data I/O pins

Table 1.19 Pin functions (6 of 10)

Classification	Pin name	I/O	Description
Ethernet	ETH0_TXCLK to ETH3_TXCLK	I/O	TX clock input pins (MII mode) TX clock output pins (RGMII mode)
	ETH0_TXD0 to ETH3_TXD0	Output	TX data 0 pins (RGMII, RMII, and MII modes)
	ETH0_TXD1 to ETH3_TXD1	Output	TX data 1 pins (RGMII, RMII, and MII modes)
	ETH0_TXD2 to ETH3_TXD2	Output	TX data 2 pins (RGMII and MII modes)
	ETH0_TXD3 to ETH3_TXD3	Output	TX data 3 pins (RGMII and MII modes)
	ETH0_TXEN to ETH3_TXEN	Output	TX data enable pins (RMII and MII modes) TX data enable/TX data error (TX_CTL) pins (RGMII mode)
	ETH0_TXER to ETH3_TXER	Output	TX data error pins (MII mode)
	ETH0_RXCLK to ETH3_RXCLK	Input	RX clock pins (RGMII, RMII, and MII modes)
	ETH0_RXD0 to ETH3_RXD0	Input	RX data 0 pins (RGMII, RMII, and MII modes)
	ETH0_RXD1 to ETH3_RXD1	Input	RX data 1 pins (RGMII, RMII, and MII modes)
	ETH0_RXD2 to ETH3_RXD2	Input	RX data 2 pins (RGMII and MII modes)
	ETH0_RXD3 to ETH3_RXD3	Input	RX data 3 pins (RGMII and MII modes)
	ETH0_RXDV to ETH3_RXDV	Input	RX data valid pins (MII mode) Carrier sense/RX data valid (CRS_DV) pins (RMII mode) RX data valid/RX error (RX_CTL) pins (RGMII mode)
	ETH0_RXER to ETH3_RXER	Input	RX data error pins (RMII and MII modes)
	ETH0_CRS to ETH3_CRS	Input	Carrier sense pins (MII mode)
	ETH0_COL to ETH3_COL	Input	Collision detection pins (MII mode)
Ethernet MAC (GMAC)	GMAC0_PTPTRG0 to GMAC2_PTPTRG0	Input	PTP timer trigger external input 0
	GMAC0_PTPTRG1 to GMAC2_PTPTRG1	Input	PTP timer trigger external input 1
	GMAC0_MDC to GMAC2_MDC	Output	Management data clock output pin
	GMAC0_MDIO to GMAC2_MDIO	I/O	Management data I/O pin
Ethernet switch (ETHSW)	ETHSW_LPI0	Output	Port 0 MAC status indicates that it is currently receiving low-power-idle sequences from the PHY
	ETHSW_LPI1	Output	Port 1 MAC status indicates that it is currently receiving low-power-idle sequences from the PHY
	ETHSW_LPI2	Output	Port 2 MAC status indicates that it is currently receiving low-power-idle sequences from the PHY
	ETHSW_PTPOUT0 to ETHSW_PTPOUT3	Output	Ethernet switch timer pulse output pins
	ETHSW_TDMAOUT0 to ETHSW_TDMAOUT3	Output	Ethernet switch TDMA timer output pins
	ETHSW_PHYLINK0 to ETHSW_PHYLINK2	Input	Ethernet switch PHY link status input pins
	ETHSW_MDC	Output	Management data clock output pin
	ETHSW_MDIO	I/O	Management data I/O pin

Table 1.19 Pin functions (7 of 10)

Classification	Pin name	I/O	Description
EtherCAT slave controller (ESC)	ESC_LEDRUN	Output	Outputs the EtherCAT RUN LED signal
	ESC_IRQ	Output	Outputs the EtherCAT IRQ signal
	ESC_LEDSTER	Output	Outputs the EtherCAT Dual-color state LED signal
	ESC_LEDERR	Output	Outputs the EtherCAT error LED signal
	ESC_LINKACT0 to ESC_LINKACT2	Output	Output the EtherCAT link/activity LED signal
	ESC_SYNC0, ESC_SYNC1	Output	Output the EtherCAT SYNC signal
	ESC_LATCH0, ESC_LATCH1	Input	Input the EtherCAT LATCH signal
	ESC_RESETOUT#	Output	Output the EtherCAT reset signal
	ESC_I2CCLK	Output	Outputs the EtherCAT EEPROM I2C clock signal
	ESC_I2CDATA	I/O	Inputs and outputs the EtherCAT EEPROM I2C data signal
	ESC_PHYLINK0 to ESC_PHYLINK2	Input	Inputs the EtherCAT PHY link status signal.
	ESC_MDC	Output	Management data clock output pin
	ESC_MDIO	I/O	Management data I/O pin
USB 2.0 host/function module	USB_USVDD33	Input	3.3 V power supply input pin for USB
	USB_USVDD18	Input	1.8 V power supply input pin for USB
	USB_USDVDD	Input	0.8 V power supply
	USB_TXRTUNE	Input	USB2 transmitter tune pin. Connect this pin to GND via 200 Ω (±1%).
	USB_QDP	I/O	USB bus D+ data I/O pin
	USB_QDM	I/O	USB bus D- data I/O pin
	USB_VBUSEN	Output	Outputs the VBUS power enable signal for USB
	USB_OVRCUR	Input	Inputs the overcurrent signal for USB
	USB_VUBUSIN	Input	USB cable connection/disconnection detection input pin
	USB_EXICEN	Output	OTG power supply IC control pin
	USB_OTG_ID	Input	OTG ID pin
CANFD module (CANFD)	CANRX0, CANRX1	Input	Receive data input pins
	CANTX0, CANTX1	Output	Transmit data output pins
	CANRXDP0, CANRXDP1	Output	Receive data phase output pins
	CANTXDP0, CANTXDP1	Output	Transmit data phase output pins
Serial peripheral interface (SPI)	SPI_RSPCK0 to SPI_RSPCK3	I/O	Clock I/O pins
	SPI_MOSI0 to SPI_MOSI3	I/O	Master transmit data I/O pins
	SPI_MISO0 to SPI_MISO3	I/O	Slave transmit data I/O pins
	SPI_SSL00 to SPI_SSL30	I/O	Slave select signal I/O pins
	SPI_SSL01 to SPI_SSL31, SPI_SSL02 to SPI_SSL32, SPI_SSL03 to SPI_SSL33	Output	Slave select signal output pins

Table 1.19 Pin functions (8 of 10)

Classification	Pin name	I/O	Description
Expanded serial peripheral interface (xSPI)	XSPI0_CKP, XSPI1_CKP, XSPI0_CKN	Output	Clock output pins
	XSPI0_CS0#, XSPI0_CS1#, XSPI1_CS0#, XSPI1_CS1#	Output	Chip select output pins
	XSPI0_DS, XSPI1_DS	I/O	Read data strobe/write data mask input/output pin
	XSPI0_IO0 to XSPI0_IO7, XSPI1_IO0 to XSPI1_IO7	I/O	Data0 to Data7 input/output pins
	XSPI0_RESET0#, XSPI0_RESET1#	Output	Master reset status output pins
	XSPI0_RSTO0#, XSPI0_RSTO1#	Input	Slave reset status input pins
	XSPI0_INT0#, XSPI0_INT1#	Input	Interrupt input pins
	XSPI0_ECS0#, XSPI0_ECS1#	Input	Error correction status input pins
	XSPI0_WP0#, XSPI0_WP1#	Output	Write protect output pins
ΔΣ interface (DSMIF)	MCLK00 to MCLK90, MCLK01 to MCLK91, MCLK02 to MCLK92	I/O	Clock I/O pins
	MDAT00 to MDAT90, MDAT01 to MDAT91, MDAT02 to MDAT92	Input	Data input pins
12-bit A/D converter (ADC12)	AVDD_ADC0 to AVDD_ADC2	Input	0.8 V power supply pins for ADC
	AVDDIO_ADC0 to AVDDIO_ADC2	Input	1.8 V power supply pins for ADC
	AVSS_ADC0 to AVSS_ADC2	Input	Ground pins for ADC
	AVSSIO_ADC0 to AVSSIO_ADC2	Input	Ground pins for ADC
	AVDDREF_ADC0 to AVDDREF_ADC2	Input	Voltage Reference Analog Supply
	AN000 to AN003, AN100 to AN103, AN200 to AN214	input	Analog input pins for the A/D converter
	ADTRG0# to ADTRG2#	input	External trigger input pins for the start of A/D conversion
Serial host interface (SHOSTIF)	HSPI_CK	Input	Clock input pin
	HSPI_CS#	Input	Chip select input pin
	HSPI_IO0 to HSPI_IO7	I/O	Data0 to Data7 input/output pins
	HSPI_INT#	Output	Interrupt output pin
Mailbox and Semaphore (MBXSEM)	MBX_HINT#	Output	Mailbox (Cortex-A55/Cortex-R52 to Host CPU) interrupt output pin
Encoder I/F common	ENCIFCK00 to ENCIFCK15	Output	Encoder I/F clock output pins
	ENCIFOE00 to ENCIFOE15	Output	Encoder I/F data output enable pins
	ENCIFDO00 to ENCIFDO15	Output	Encoder I/F data output pins
	ENCIFDI00 to ENCIFDI15	Input	Encoder I/F data input pins
EnDat 2.2 (ENDAT)	DUEI00 to DUEI15	Output	EnDat 2.2 Data transfer
	TST_OUT00 to TSTOUT15	Output	EnDat 2.2 Data input after internal synchronization
	SI00# to SI15#	Output	EnDat 2.2 Start pulse

Table 1.19 Pin functions (9 of 10)

Classification	Pin name	I/O	Description
Hiperface DSL (HDSL)	HDSL00_LINK to HDSL15_LINK	Output	HDSL LINK
	HDSL00_SMPL to HDSL15_SMPL	Output	HDSL Test signal line sampler
	HDSL00_CLK1 to HDSL15_CLK1	Input	HDSL SPI clock safe 1
	HDSL00_SEL1 to HDSL15_SEL1	Input	HDSL SPI selection safe 1
	HDSL00_MISO1 to HDSL15_MISO1	Output	HDSL SPI data output safe 1
	HDSL00_MOSI1 to HDSL15_MOSI1	Input	HDSL SPI data input safe 1
	HDSL00_CLK2 to HDSL15_CLK2	Input	HDSL SPI clock safe 2
	HDSL00_SEL2 to HDSL15_SEL2	Input	HDSL SPI selection safe 2
	HDSL00_MISO2 to HDSL15_MISO2	Output	HDSL SPI data output safe 2
	HDSL00_MOSI2 to HDSL15_MOSI2	Input	HDSL SPI data input safe 2
ENCOUT	POUTA	Output	ENCOUT A-phase output pin
	POUTB	Output	ENCOUT B-phase output pin
	POUTZ	Output	ENCOUT Z-phase output pin
LCD Controller (LCDC)	DISP_CLK	Output	Display Parallel Interface pixel clock
	DISP_HSYNC	Output	Display Parallel Interface Horizontal sync pulse
	DISP_VSYNC	Output	Display Parallel Interface Vertical sync pulse
	DISP_DE	Output	Display Parallel Interface data enable
	DISP_DATAR0 to DISP_DATAR7	Output	Display Parallel Interface pixel data output Red
	DISP_DATAG0 to DISP_DATAG7	Output	Display Parallel Interface pixel data output Green
	DISP_DATAB0 to DISP_DATAB7	Output	Display Parallel Interface pixel data output Blue
SD/eMMC Host Interface (SDHI)	SD0_CLK, SD1_CLK	Output	SD/MMC clock output
	SD0_CMD, SD1_CMD	I/O	SD/MMC command output, response input
	SD0_DATA0 to SD0_DATA7, SD1_DATA0 to SD1_DATA3	I/O	SD/MMC Data
	SD0_CD, SD1_CD	Input	SD card detection
	SD0_WP, SD1_WP	Input	SD write protection
	SD0_RST#	Output	MMC reset
	SD0_PWEN, SD1_PWEN	Output	SD power enable
	SD0_IOVS, SD1_IOVS	Output	SD voltage select
PCI Express Gen3 (PCIE)	PCIE_VDD18A_CMN, PCIE_VDD18A_L0, PCIE_VDD18A_L1	Input	1.8 V power supply pins for PCIE
	PCIE_VDD08A_L0, PCIE_VDD08A_L1	Input	0.8 V power supply pins for PCIE
	PCIE_REFCLK_P0, PCIE_REFCLK_N0, PCIE_REFCLK_P1, PCIE_REFCLK_N1	Input	Reference clock input
	PCIE_RXDP_L0, PCIE_RXDN_L0, PCIE_RXDP_L1, PCIE_RXDN_L1	Input	Serial data input
	PCIE_TXDP_L0, PCIE_TXDN_L0, PCIE_TXDP_L1, PCIE_TXDN_L1	Output	Serial data output
	PCIE_RSTOUT0B, PCIE_RSTOUT1B	Output	PCIE Reset output for Root Complex

Table 1.19 Pin functions (10 of 10)

Classification	Pin name	I/O	Description
LPDDR4 SDRAM Subsystem (DDRSS)	DDR_VAA	Input	1.8 V power supply pin for DDRPHY
	DDR_VDDQ	Input	1.1 V power supply pin for DDRPHY
	DDR_ZN	Output	DDRSS calibration external reference resistor
	DDR_DTEST	I/O	DDRSS Digital test point for debug
	DDR_ATEST	I/O	DDRSS Analog test point for debug
	DDR_RESET_N	Output	DDRSS DRAM reset
	DDR_CKA_T, DDR_CKA_C, DDR_CKB_T, DDR_CKB_C	I/O	DDRSS DRAM Ch A/B Clock
	DDR_CKEA[1:0], DDR_CKEB[1:0]	I/O	DDRSS DRAM Ch A/B Clock Enable
	DDR_CSA[1:0], DDR_CSB[1:0]	I/O	DDRSS DRAM Ch A/B Chip Select
	DDR_CAA[5:0], DDR_CAB[5:0]	I/O	DDRSS DRAM Ch A/B Command/Address
	DDR_DQA[15:0], DDR_DQB[15:0]	I/O	DDRSS DRAM Ch A/B Data
	DDR_DMIA[1:0], DDR_DMIB[1:0]	I/O	DDRSS DRAM Ch A/B Data Mask Inversion
	DDR_DQSA_T[1:0], DDR_DQSB_T[1:0]	I/O	DDRSS DRAM Ch A/B Data Strobe (positive)
	DDR_DQSA_C[1:0], DDR_DQSB_C[1:0]	I/O	DDRSS DRAM Ch A/B Data Strobe (negative)
I/O ports	P00_0 to P35_6	I/O	General-purpose input/output pins

1.6 RZ/T2H FCBGA 729 Pin Assignments

Figure 1.2 shows the pin arrangement. Table 1.20 shows the lists of pins and the pin functions.

2. Cortex-A55

2.1 Overview

The LSI includes Arm® Cortex®-A55 Core and DynamIQ™ Shared Unit.

Table 2.1 shows the specifications of the Cortex-A55.

Table 2.1 Specifications of Cortex-A55

Item		Specification
Cluster	Core	Arm® Cortex-A55 Core r2p0 (ARMv8-A), Quad cores
	DSU	Arm® DynamIQ™ Shared Unit (r4p1)
Clock frequency	Core	600 / 1200 MHz
	DSU	500 / 1000 MHz
Address space		32 GB
Cache	L1 instruction cache	32 KB (with parity) per core
	L1 data cache	32 KB (with ECC) per core
	L2 cache	0 KB
	L3 cache	1024 KB (with ECC)
Instruction set		Armv8.2-A A64 instruction sets (AArch64)
Data arrangement		Little endian
System bus interface		• 128-bit ACE master interface • 64-bit AXI master peripheral port (0x00_8000_0000 to 0x00_902F_FFFF)
Security		• Arm® TrustZone® technology • Cryptographic Extension (optional)
Data engine unit		The Advanced SIMD and scalar floating-point instructions in the A64 instruction set including Dot Product instruction
Debug		• Reliability, Availability, and Serviceability (RAS) Extension • Performance Monitoring Unit (PMU) • Embedded Trace Macrocell (ETM) for instruction trace
Interrupt controller		GIC-600

For details, refer to the following documents supplied by Arm.

- Arm® Cortex®-A55 Core Technical Reference Manual
- Arm® Cortex®-A55 Core Advanced SIMD and Floating-point Support Technical Reference Manual
- Arm® Cortex®-A55 Core Cryptographic Extension Technical Reference Manual
- Arm® DynamIQ™ Shared Unit Technical Reference Manual
- Arm® CoreLink™ GIC-600 Generic Interrupt Controller Technical Reference Manual
- Arm® Architecture Reference Manual Armv8, for the Armv8-A architecture profile

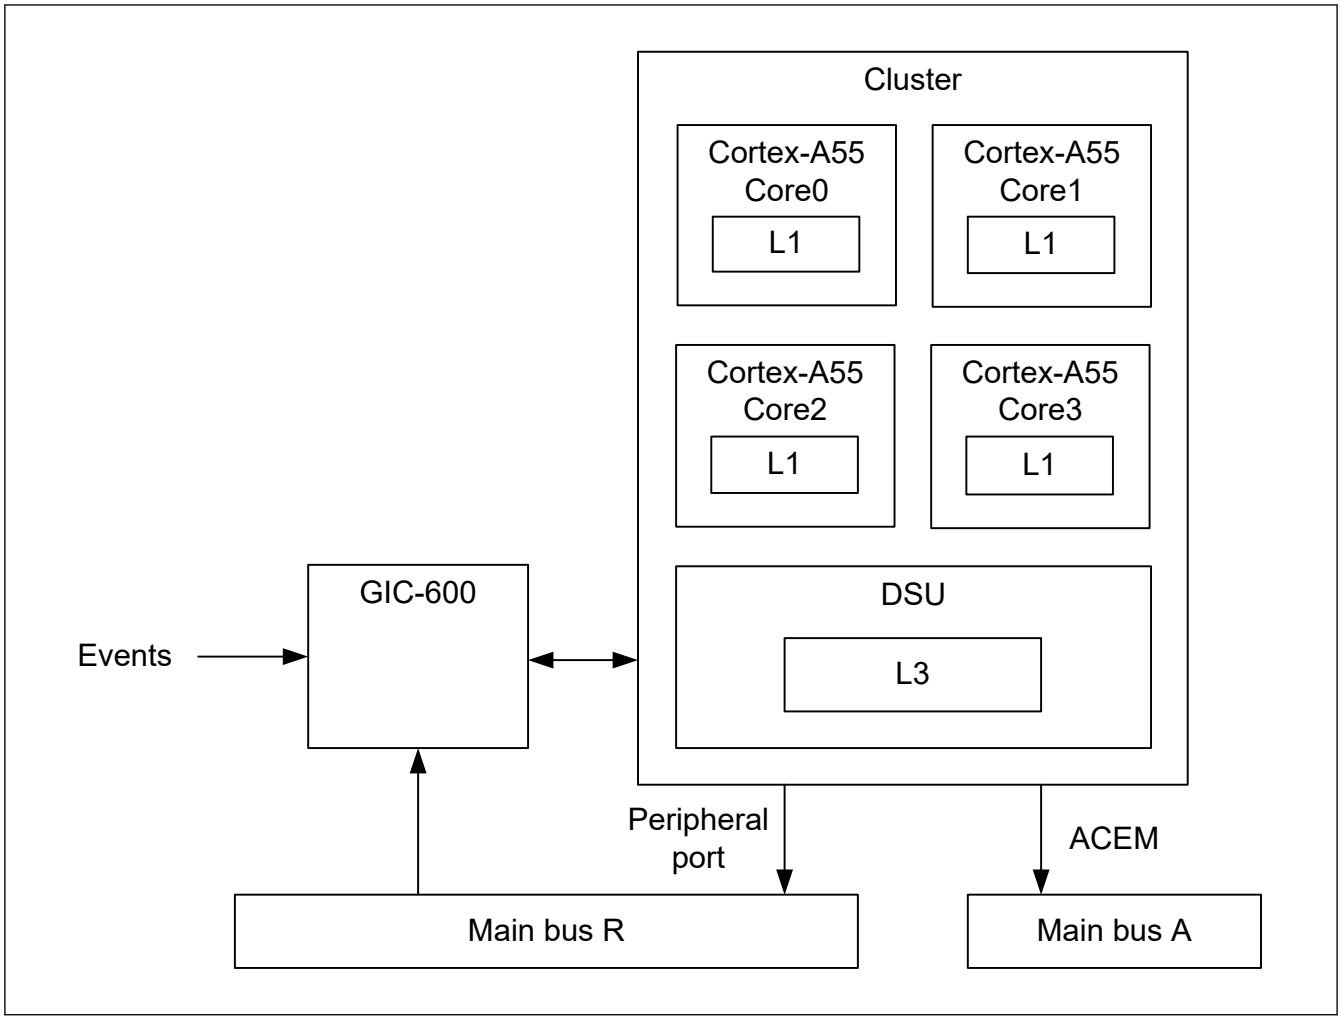

Figure 2.1 Block diagram of Cortex-A55

2.2 Configuration Information

Table 2.2 and Table 2.3 lists the configuration options for Cortex-A55 Core and DSU of this LSI.

Table 2.2 Core Configuration options

Feature	Setting value
L1 instruction cache size	32 KB
L1 data cache size	32 KB
L2 cache	Not included
L2 cache size	—
ECC or parity core cache protection	Included
Advanced SIMD and floating-point support	Included
Cryptographic Extension	Included (Security support product only)
CoreSight Embedded Logic Analyzer (ELA)	Not included
CoreSight ELA RAM address size	—
Page Based Hardware Attributes (PBHA) support	Not included

Table 2.3 DSU Configuration options (1 of 2)

Feature	Setting value
NUM_BIG_CORES	0

Table 2.3 DSU Configuration options (2 of 2)

Feature	Setting value
NUM_LITTLE_CORES	4
NUM_OTHER_CORES	0
ACE	TRUE
MASTER_DATA_WIDTH	128
ACP	FALSE
PERIPH_PORT	TRUE
SCU_CACHE_PROTECTION	TRUE
L3_CACHE	TRUE
L3_CACHE_SIZE	1024 KB
NUM_SLICES	1
L3_DATA_WR_LATENCY	1
L3_DATA_RD_LATENCY	2
ASYNC_BRIDGE	TRUE
LEGACY_V7_DEBUG_MAP	FALSE
ELA	FALSE
L3_PBHA	FALSE

2.3 Restrictions on CPU

For details on restrictions on Cortex-A55 implemented in this LSI, refer to the information provided at the website of Arm.

2.4 Register Map

Table 2.4 Cortex-A55 auxiliary register map

Address	Register symbol	Register name	Write protection
0x8129_5020 + 0x08 × n	RVBALn	CA55 Core n Reset Vector Address Low Configuration Register (n = 0 to 3)	PRCRS.PRC3
0x8129_5024 + 0x08 × n	RVBAHn	CA55 Core n Reset Vector Address High Configuration Register (n = 0 to 3)	PRCRS.PRC3

Table 2.5 Cortex-A55 auxiliary related system control register

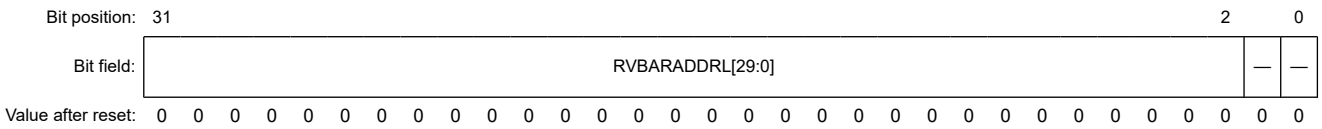
Target	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
RVBALn, RVBAHn	—	—	SLVACCCTL6.CA55_SL
GIC-600	—	—	SLVACCCTL7.GIC600_SL

2.5 Register Descriptions

2.5.1 RVBALn : CA55 Core n Reset Vector Address Low Configuration Register (n = 0 to 3)

Base address: CA55 = 0x8129_5000

Offset address: 0x20 + 0x08 × n



Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
31:2	RVBARADDRL[29:0]	Cortex-A55 Core n Reset Vector Address Low Set 30 bits from bit 31 to bit 2 of the 40-bit address. Lower 2 bits from bit 1 and bit 0 of the 40-bit address is set 00b automatically.	R/W

The RVBALn register is used to set reset vector address of Cortex-A55. In case of Cortex-A55 boot mode, 0x101FD000 is set to RVBAL0 automatically.

2.5.2 RVBAHn : CA55 Core n Reset Vector Address High Configuration Register (n = 0 to 3)

Base address: CA55 = 0x8129_5000

Offset address: 0x24 + 0x08 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RVBARADDRH[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RVBARADDRH[7:0]	Cortex-A55 Core n Reset Vector Address High Set 8 bits from bit 39 to bit 32 of the 40-bit address. Bit [7:3] should be set to 0.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The RVBAHn register is used to set reset vector address of Cortex-A55.

2.6 Usage Notes

2.6.1 How to Start up Cortex-A55

After a RES# pin reset, a system software reset, or an error reset occurs, Cortex-A55 Core 0 to Core 3 and WDTs for Cortex-A55 remain in the reset state and module stop state in case of Cortex-R52 boot mode. Start-up Cortex-A55 by other CPU according to the below sequence.

1. Store the instruction code to the reset vector address you want to specify.
2. Start up the PLL0. For detail, see section 7.5. PLL Circuit.
3. Release Core n from the module stop state by resetting corresponding bit (bit 2 to bit 5) in MSTPCRN register. DSU is always out of the module stop state.
4. Set the reset vector address in RVBALn and RVBAHn registers.
5. Release DSU and Core n from the reset state by setting 0x00000000 to SWR55C and corresponding SWR55n register.

In case of Cortex-A55 boot mode, Cortex-A55 Core 0 starts up automatically by performing the above sequence in boot ROM. Cortex-A55 Core 1 to Core 3 remain in the reset state and module stop state. Start up sequence is same as the above, but it is not needed to operate PLL0 and DSU repeatedly.

Note that P-Channels and Q-Channels are not used in this LSI.

2.6.2 Generic Timer

Cortex-A55 is provided system counter value from Global System Counter for Generic Timer. For detail, see section 3.6.3. Global System Counter (TSG-CNT).

3. Cortex-R52

3.1 Overview

The LSI includes two Cortex®-R52 CPUs. The revision of module is r1p4-00refl0.

Table 3.1 shows the specifications of the CPU.

Table 3.1 CPU specifications

Item		Description	
		CPU0	CPU1
Cortex-R52	Minimum instruction execution time	One clock per instruction	
	Address space	4 GB	
	Instruction cache size	16 KB (with ECC)	16 KB (with ECC)
	Data cache size	16 KB (with ECC)	16 KB (with ECC)
	Tightly coupled memory (TCM) size	ATCM: 512 KB (with ECC) BTCM: 64 KB (with ECC)	ATCM: 512 KB (with ECC) BTCM: 64 KB (with ECC)
	Instruction set	Armv8-R architecture supporting Thumb®/Thumb-2	
	Data arrangement	Instruction: Little-endian Data: Little-endian	
	Memory protection	2-stage memory protection unit (MPU)	
	FPU	• Supports addition, subtraction, multiplication, division, product-sum operation, and square-root operation in single-precision and double-precision • 64-bit single word register: 32 registers • Can also be used as sixteen 128-bit double word registers	
	NEON	• The advanced SIMD supporting integer or single precision results	

For details, see the following Arm documents:

- Arm® Architecture Reference Manual Armv8, for Armv8-A architecture profile
- Arm® Architecture Reference Manual Supplement Armv8, for the Armv8-R architecture profile
- Arm® Cortex®-R52 Processor Technical Reference Manual

3.2 Configuration Information

Table 3.2 lists the configuration options for the Cortex-R52 CPU of this LSI.

Table 3.2 Configuration options (1 of 2)

Feature	Setting value	
	CPU0	CPU1
Number of cores	1	1
Lock-step	No redundant logic included	No redundant logic included
EL1-controlled MPU	24	24
EL2-controlled MPU	24	24
AXI bus protection	No bus protection included	No bus protection included
RAM protection	Included for all RAMs	Included for all RAMs
Number of interrupts (SPIs) into the interrupt controller	544	544
AXIS ID bits	14	14
Advanced SIMD and floating-point capabilities for each core	Supported	Supported

Table 3.2 Configuration options (2 of 2)

Feature	Setting value	
	CPU0	CPU1
Size of each of the three TCMs on each core	ATCM: 512 KB BTCM: 64 KB CTCM: 0 KB	ATCM: 512 KB BTCM: 64 KB CTCM: 0 KB
TCM wait states for each core	ATCM: 0 wait state (500 MHz) / 1 wait state (1000 MHz)*1 BTCM: 0 wait state	ATCM: 0 wait state (500 MHz) / 1 wait state (1000 MHz)*1 BTCM: 0 wait state
Instruction cache size for each core	16 KB	16 KB
Data cache size for each core	16 KB	16 KB
External device interfaces to GIC	0	0
Flash ECC scheme	Not available	Not available
Vector table base address out of reset (after running boot ROM)	0x0000_0000 (Start address of ATCM in CPU0)	0x0000_0000 (Start address of ATCM in CPU1)
Base address of the AXIS interface	0x2000_0000	0x2100_0000
Base address of the LLPP	0x9000_0000	0x9000_0000
Base address of the GIC registers	0x9400_0000	0x9C00_0000
Cluster ID	0x0 at affinity level 1 0x1 at affinity level 2	0x0 at affinity level 1 0x2 at affinity level 2

Note 1. It depends on the MDW0/1 pin setting at release of reset. If 1000 MHz operation is required, 1 wait state is mandatory.

3.3 Restrictions on the CPU

For details on restrictions of the Cortex-R52 CPU implemented in this LSI, see the information provided on the Arm website.

3.4 Register Map

Table 3.3 Cortex-R52 auxiliary register map

Address	Register symbol	Register name	Write protection
0x8129_5008	CPU0WAIT	CPU0 ATCM Wait State Register	—

Global System Counter related registers	—	—	SLVACCCTL7.CSDBGAPB_SL

3.5 Register Descriptions

3.5.1 CPU0WAIT : CPU0 ATCM Wait State Register

Base address: TCMAW = 0x8129_5000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU0 WAIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x*1

Bit	Symbol	Function	R/W
0	CPU0WAIT	ATCM Wait state 0: 0-wait state (MDW0 = 0) 1: 1-wait state (MDW0 = 1)	R
31:1	—	These bits are read as 0.	R

Note 1. It depends on the state of MDW pin latched at release of RES# pin on power on.

The CPU0WAIT is a register that indicates ATCM access wait in Cortex-R52 CPU0. It is set by the state of the MDW0 pin latched at release of RES# pin on power on.

3.5.2 CPU1WAIT : CPU1 ATCM Wait State Register

Base address: TCMAW = 0x8129_5000

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU1 WAIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	CPU1WAIT	ATCM Wait state 0: 0-wait state (MDW1 = 0) 1: 1-wait state (MDW1 = 1)	R
31:1	—	These bits are read as 0.	R

The CPU1WAIT is a register that indicates ATCM access wait in Cortex-R52 CPU1. It is set by the state of the MDW1 pin latched at release of RES# pin on power on.

3.5.3 CPU1HALT : CPU1 HALT Control Register

Base address: TCMAW = 0x8129_5000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU1 HALT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	CPU1HALT	Instruction fetch after reset release 0: Start instruction fetch 1: Stop instruction fetch	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The CPU1HALT register is used to stop instruction fetch after Cortex-R52 CPU1 software reset is released. After storing the instruction code to ATCM of Cortex-R52 CPU1 via AXIS interface, write 0 to CPU1HALT bit to start instruction fetch. This register is reset in case of cold reset, system software reset, and error reset. This register is not reset in case of other CPU software resets.

3.5.4 CNTCR : Global System Counter Control Register

Base address: GSC = 0x8C20_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HDBG	EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

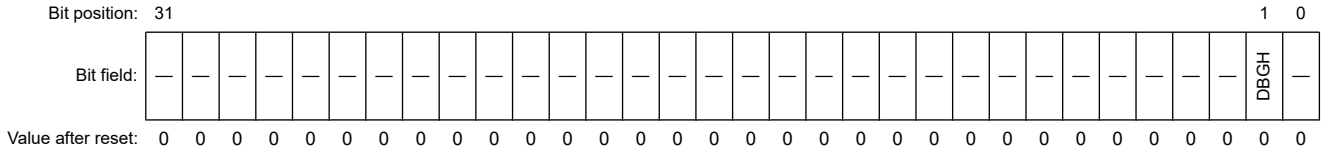
Bit	Symbol	Function	R/W
0	EN	Counter Enable 0: The counter is disabled and not incrementing 1: The counter is enabled and is incrementing	R/W
1	HDBG	Halt on Debug HLTDBG is internal signal and it is driven high when CTI trigger output[4] (TSG-CNT HALTREQ) is asserted. It is driven low when CTI trigger output[5] (TSG-CNT RESTARTREQ) is asserted. 0: Do not halt on debug, HLTDBG signal into the counter has no effect 1: Halt on debug, when HLTDBG is driven high, the count value is held static	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The CNTCR register controls the global system counter (TSG-CNT) increments.

3.5.5 CNTSR : Global System Counter Status Register

Base address: GSC = 0x8C20_0000

Offset address: 0x04



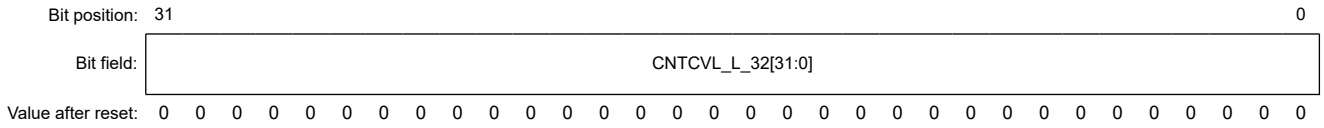
Bit	Symbol	Function	R/W
0	—	This bit is read as 0.	R
1	DBGH	Debug Halted 0: Not halt on debug 1: Halt on debug	R
31:2	—	These bits are read as 0.	R

The CNTSR register indicates the global system counter (TSG-CNT) status.

3.5.6 CNTCVL : Global System Counter Current Value Lower Register

Base address: GSC = 0x8C20_0000

Offset address: 0x08



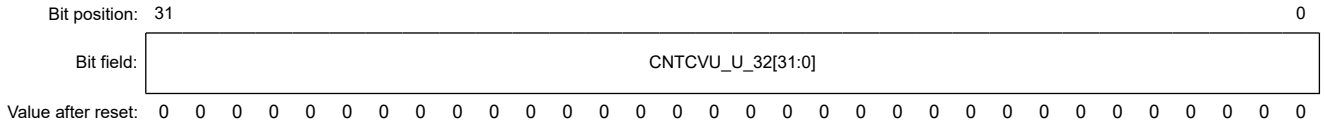
Bit	Symbol	Function	R/W
31:0	CNTCVL_L_32[31:0]	Current value of the counter, lower 32 bits To change the current value, write the lower 32 bits of the new value to this register before writing the upper 32 bits to CNTCVU. The counter value is not changed until the CNTCVU register is written to.	R/W

The CNTCVL register reads or writes the lower 32 bits of the current global system counter (TSG-CNT) value. Before writing to this register, clear the CNTCR.EN bit.

3.5.7 CNTCVU : Global System Counter Current Value Upper Register

Base address: GSC = 0x8C20_0000

Offset address: 0x0C



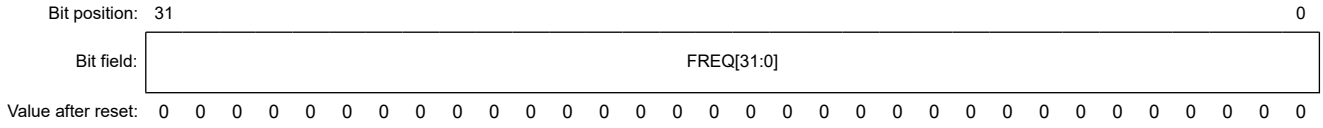
Bit	Symbol	Function	R/W
31:0	CNTCVU_U_32[31:0]	Current value of the counter, upper 32 bits To change the current value, write the lower 32 bits of the new value to CNTCVL before writing the upper 32 bits to this register. The 64-bit value is updated with the value from both writes when this register is written to.	R/W

The CNTCVU register reads or writes the upper 32 bits of the current global system counter (TSG-CNT) value. Before writing to this register, clear the CNTCR.EN bit.

3.5.8 CNTFID0 : Global System Counter Base Frequency ID Register

Base address: GSC = 0x8C20_0000

Offset address: 0x20



Bit	Symbol	Function	R/W
31:0	FREQ[31:0]	Frequency in number of ticks per second Clock for generic timer counter is the main oscillator clock (25 MHz). Write 0x017D7840 for 25 MHz clock.	R/W

The CNTFID0 register specifies the clock frequency of the global system counter (TSG-CNT) in ticks per second.

3.6 Usage Notes

3.6.1 How to Start Up Cortex-R52 CPU0

After a RES# pin reset, a system software reset, or an error reset occurs, Cortex-R52 CPU0 starts up automatically in boot ROM in case of Cortex-R52 boot mode.

In case of Cortex-A55 boot mode, Cortex-R52 CPU0 remains WFI state. Module stop and reset is released. Start-up Cortex-R52 CPU0 by other CPU according to the below sequence.

1. Set filter unit 0 of TZC-400-8 to allow access to TCM of CPU0.
2. Store the instruction code to start address of the ATCM of CPU0 via AXIS interface (0x2000_0000). Since privileged access is only permitted to access AXIS interface, transaction must be privileged.
3. Reset CPU0 and release the reset state by setting 0x4321A502 to SWRCPU0 register.

3.6.2 How to Start Up Cortex-R52 CPU1

After a RES# pin reset, a system software reset, or an error reset occurs, Cortex-R52 CPU1 and WDT for CPU1 remain in the reset state and module stop state. Start-up Cortex-R52 CPU1 by other CPU according to the below sequence.

1. Set ATCM of CPU1 via AXIS interface (0x2100_000) to Device attribute.
2. Release from the module stop state by resetting MSTPCRN01 bit in MSTPCRN register.
3. Release from the reset state by setting 0x00000000 to SWRCPU1 register.
4. Release from the slave stop state by controlling AXIS1_REQ and AXIS1_ACK bits in SSTPCR7 register.
5. Set filter unit 1 of TZC-400-8 to allow access to TCM of CPU1.
6. Store the instruction code to start address of the ATCM of CPU1 via AXIS interface (0x2100_0000) with 64-bit aligned 64-bit access by STRD instruction. Since privileged access is only permitted to access AXIS interface after reset release, transaction must be privileged. It is recommended to initialize the remaining area of ATCM with the same access manner if it exists since ECC is enabled by default.
7. Start instruction fetch by writing 0 to CPU1HALT bit in CPU1HALT register.

3.6.3 Global System Counter (TSG-CNT)

The global system counter (TSG-CNT) is a 64-bit counter that provides system counter value to generic timers of Cortex-A55, Cortex-R52 CPU0 and CPU1. Before using generic timer, the global system counter related registers must be set. Clock for global system counter is the main oscillator clock (25 MHz). Therefore, the Global System Counter Base Frequency ID register (CNTFID0) must be set to 0x017D7840.

TSG-CNT is implemented in CoreSight. For details, see section 10, Debugging Interface.

3.6.4 Caution of Interrupt Service Routine

In case of level interrupt, it is needed to clear interrupt factor in the interrupt service routine (ISR) generally. It may take some time to complete it due to write data buffering in the CPU and internal bus. If interrupt handler exits before completion of clearing interrupt factor at the peripheral, interrupt handler starts again. And if clearing interrupt factor is completed before GIC register is read in the interrupt handler, INTID of 1023 (0x3FF) may be read since no pending interrupt is available at this moment. To avoid this situation, make sure that interrupt factor is cleared definitely by reading related register before exiting ISR.

4. Operating Modes

4.1 Overview

The LSI is intended for booting up from an external flash memory. Seven boot modes are available for the types of flash memory that supports seven different operating modes. In each of the boot modes, the user program stored in the corresponding external flash memory is booted up and runs. Secure boot mode (in which a user program is protected by encryption) can also be selected for the products that support security functions.

4.2 Types and Selection of Operating Modes

One of the seven types of operating modes can be selected, depending on the method of connecting to an external flash memory. An operating mode is selected based on the input levels of the mode setting pins (MD2, MD1, and MD0) at the time pin reset (except software reset) is released.

Table 4.1 describes the relationship between the input levels of the mode setting pins (MD2, MD1, and MD0) at the time reset is released and the selected operating mode. Value of the pins (MD2 to MD0) are latched to the registers when reset is released. For details on individual operating modes, see section 4.6. Operating Mode Descriptions.

Table 4.1 Selection of operating mode for each combination of levels of mode setting pins

Mode setting pins			
MD2	MD1	MD0	Operating mode
Low	Low	Low	xSPI0 boot mode (x1 boot serial flash) Boots a program from x1 boot serial flash memory connected to the xSPI0 CS0 space. Supporting voltage: 3.3 V or 1.8 V
Low	Low	High	xSPI0 boot mode (x8 boot serial flash) Boots a program from x8 boot serial flash memory such as HyperFlash memory connected to the xSPI0 CS0 space. Supporting voltage: 3.3 V or 1.8 V
Low	High	Low	xSPI1 boot mode (x1 boot serial flash) Boots a program from x1 boot serial flash memory connected to the xSPI1 CS0 space. Supporting voltage: 3.3 V or 1.8 V
Low	High	High	eSD boot mode Boots a program from eSD connected to SDHI1. Supporting voltage: 3.3 V
High	Low	Low	eMMC boot mode Boots a program from eMMC connected to SDHI0. Supporting voltage: 3.3 V or 1.8 V
High	Low	High	SCI (UART) boot mode Boots a program from host PC through UART communication connected to the SCI0. For flash writer use.
High	High	Low	USB boot mode Boots a program from host PC through USB. For flash writer use.
High	High	High	Reserved (setting prohibited)

IO voltage of boot peripheral which supports 3.3 V or 1.8 V is selected based on the input levels of the voltage setting pin (MDV). Table 4.2 shows the selection of IO voltage of boot peripheral which supports 3.3 V or 1.8 V. Value of the pin (MDV) is latched to the register when reset is released. The target operating mode is xSPI0 boot mode (x1, x8), xSPI1 boot mode (x1) and eMMC boot mode. For eSD boot mode, SCI boot mode and USB boot mode, MDV setting has no influence.

Table 4.2 Selection of IO voltage of boot peripheral which supports 3.3 V or 1.8 V

MDV	IO voltage of boot peripheral
Low	1.8 V
High	3.3 V

Wait cycle for ATCM in Cortex-R52 is selectable from 0 wait or 1 wait only during reset. So ATCM wait cycle setting pins (MDW0 for CPU0 and MDW1 for CPU1) are used to capture the value. The values of these pins are latched to the register when reset is released as well as MDn and MDV.

Table 4.3 Selection of ATCM wait cycle

MDW0/1	ATCM wait cycle
Low	0 wait. Valid in case CPU operating frequency is 500 MHz.
High	1 wait. Valid in case CPU operating frequency is 500 MHz or 1000 MHz. When using 1000 MHz, select this setting.

JTAG authentication by hash is handled by boot ROM. Boot ROM must identify whether JTAG is connected at boot sequence. JTAG authentication by hash enabling pin (MDD) is used to notify the CPU of whether JTAG is connected securely. The value of this pin is latched to the register when reset is released as well as other mode setting pins. This pin is valid for products that support security functions. For non-security support products, value of this pin is not used.

Table 4.4 Selection of JTAG authentication by Hash

MDD	JTAG mode
Low	Normal mode JTAG authentication by Hash is disabled
High	JTAG authentication by Hash mode

These setting pins (MD2 to MD0, MDV, MDW0/1, and MDD) can be shared with other peripheral function pins as strap option. The I/O voltage of these pins is voltage of the corresponding IO power domain (VDD1833_n).

4.3 Hardware Used in Individual Operating Modes

Table 4.5 describes hardware used in individual operating modes. Pins to be used indicates pins required to execute each operating mode. At boot, the initial values defined for each operating mode are automatically set to these pins by hardware.

Table 4.5 Hardware used in individual operating modes

Operating mode	Peripheral module	Pins to be used
xSPI0 boot mode (x1 boot Serial flash)	Expanded serial peripheral interface (xSPI0)	XSPI0_CKP XSPI0_CS0# XSPI0_IO0, XSPI0_IO1
xSPI0 boot mode (x8 boot Serial flash)	Expanded serial peripheral interface (xSPI0)	XSPI0_CKP, XSPI0_CKN XSPI0_CS0#, XSPI0_DS XSPI0_IO0 to XSPI0_IO7 XSPI0_RESET0#
xSPI1 boot mode (x1 boot Serial flash)	Expanded serial peripheral interface (xSPI1)	XSPI1_CKP XSPI1_CS0# XSPI1_IO0, XSPI1_IO1
eSD boot mode	SD/eMMC host interface (SDHI1)	SD1_CLK, SD1_CMD, SD1_DATA0 to SD1_DATA3
eMMC boot mode	SD/eMMC host interface (SDHI0)	SD0_CLK, SD0_CMD, SD0_DATA0 to SD0_DATA7, SD0_RST#
SCI (UART) boot mode	Serial communication interface (SCI)	TXD0, RXD0
USB boot mode	USB 2.0 HS function module	USB_QDP USB_QDM

Note: For relationship between pin function and I/O port on boot mode, see section 17.7.6. Pin Assignment of each Boot Mode.

4.4 Register Map

Table 4.6 Operating Mode register map

Address	Register symbol	Register name	Write protection

Table 4.7 Operating Mode related system control register

Target	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
MD_MON	—	—	Fixed to 0

4.5 Register Descriptions

4.5.1 MD_MON : Operating Mode Monitor Register

Base address: MD_NS = 0x8029_4100

Offset address: 0x0000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MDVMON	—	MD2MON	MD1MON	MD0MON	—	—	—	MDP	—	—	MDW1MON	MDW0MON	—	—	—	MDDMON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	0	*1	*1	*1	0	0	0	*2	0	0	*1	*1	0	0	0	*1

Bit	Symbol	Function	R/W
0	MDDMON	MDD status flag This bit holds a value that indicates the level on the external MDD pin latched when reset is released.	R
3:1	—	These bits are read as 0.	R
4	MDW0MON	MDW0 status flag This bit holds a value that indicates the level on the external MDW0 pin latched when reset is released.	R
5	MDW1MON	MDW1 status flag This bit holds a value that indicates the level on the external MDW1 pin latched when reset is released.	R
7:6	—	These bits are read as 0.	R
8	MDP	Package type The bit indicates the package type of this device. 0: RZ/T2H 729pin FCBGA 1: RZ/N2H 576pin FCBGA	R
11:9	—	These bits are read as 0.	R
12	MD0MON	MD0 pin status flag This bit holds a value that indicates the level on the external MD0 pin latched when reset is released.	R
13	MD1MON	MD1 pin status flag This bit holds a value that indicates the level on the external MD1 pin latched when reset is released.	R
14	MD2MON	MD2 pin status flag This bit holds a value that indicates the level on the external MD2 pin latched when reset is released.	R
15	—	This bit is read as 0.	R
16	MDVMON	MDV status flag This bit holds a value that indicates the level on the external MDV pin latched when reset is released.	R
31:17	—	These bits are read as 0.	R

Note 1. The value depends on whether the signal is being externally pulled up or down, and the value at the time of latching on deassertion of the reset signal.

Note 2. The value depends on the package type.

The MD_MON register is for checking the mode (externally pulled up or down) of the MDD, MDW0/1, MD0 to MD2, and MDV pins by the CPU.

This register latches the values at the same time as deassertion of the signal on the external reset pin (RES#). Afterwards, it holds the values until the signal is asserted again. For reset sources and the timing of release from the reset state, see section 6, Reset.

4.6 Operating Mode Descriptions

4.6.1 Boot Function

After reset is released on this LSI, the boot function executes the boot processing on Cortex-R52 CPU0 as described below. The boot processing can extract a loader program that was stored in an external memory in advance by the user, to either the internal tightly coupled memory (TCM) area or System SRAM (SYSRAM) dependent on the second boot CPU, and hand over the processing to the loader program at the start address of that program. The loader program processes the second boot. Second boot CPU can be selected from Cortex-R52 CPU0 or Cortex-A55 Core 0.

(1) Setting the boot peripheral (xSPI or SDHI) specified by the mode setting pins (MD2, MD1, and MD0)

(2) Loading parameters for the loader from an external memory, and checking CHECK_SUM value

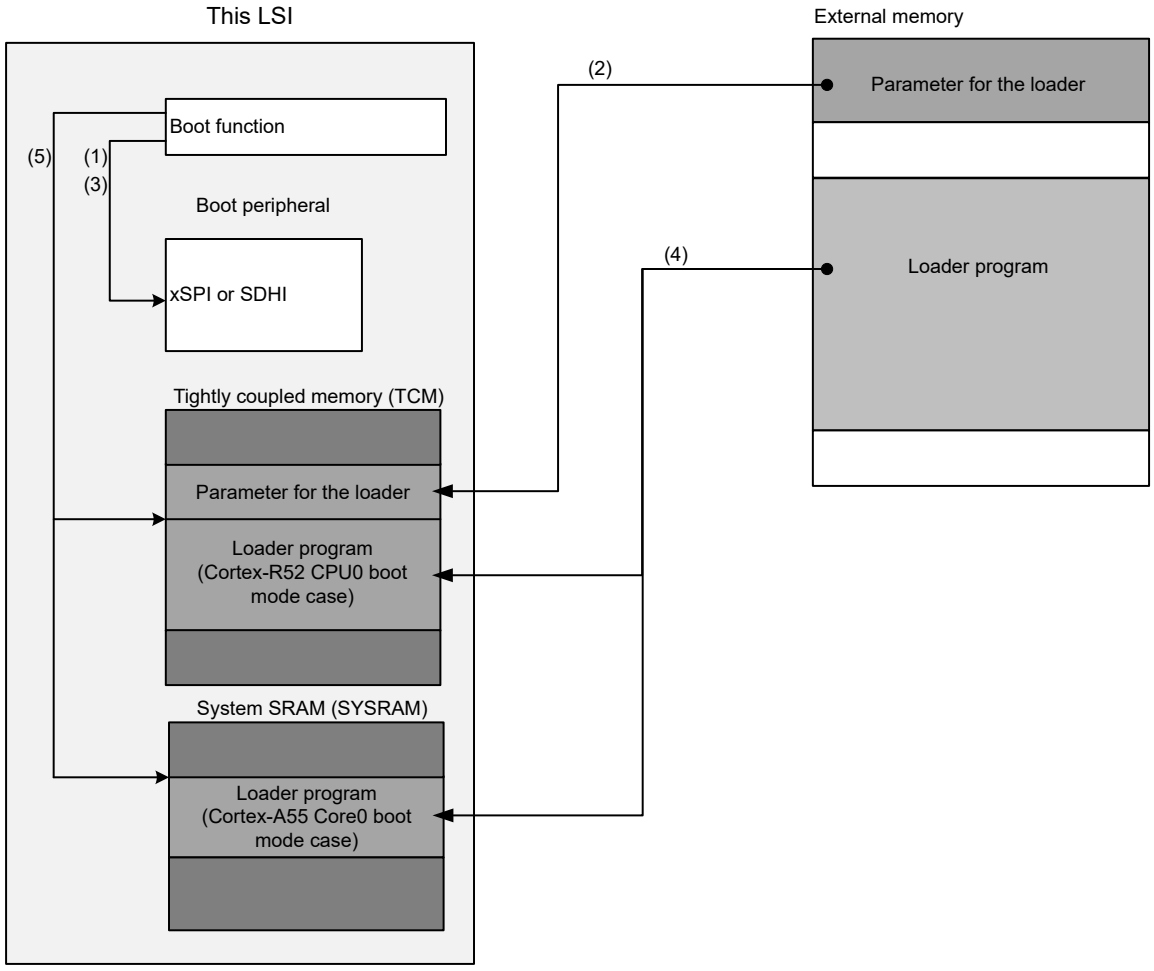
(3) Setting for speeding up the boot peripheral (xSPI or SDHI) by using parameters for the loader

(4) Loading the loader program from an external memory

(5) When Cortex-A55 is selected as second boot CPU, reset of Cortex-A55 Core0 is released and Cortex-R52 CPU0 transitioned to the WFI state instead. Then, second boot CPU (Cortex-R52 CPU0 or Cortex-A55 Core0) branches off to the start address of the loader program extracted to the tightly coupled memory (TCM) for Cortex-R52 CPU0 boot or System SRAM (SYSRAM) for Cortex-A55 Core0 boot.

Parameters for the loader can have configuration information that is suited for the user system, such as loader program information, cache setting for speeding up the boot processing, and boot peripheral (xSPI or SDHI) settings. Parameters for the loader must be stored in an external memory in advance by the user.

Figure 4.1 shows the operating overview of boot processing.



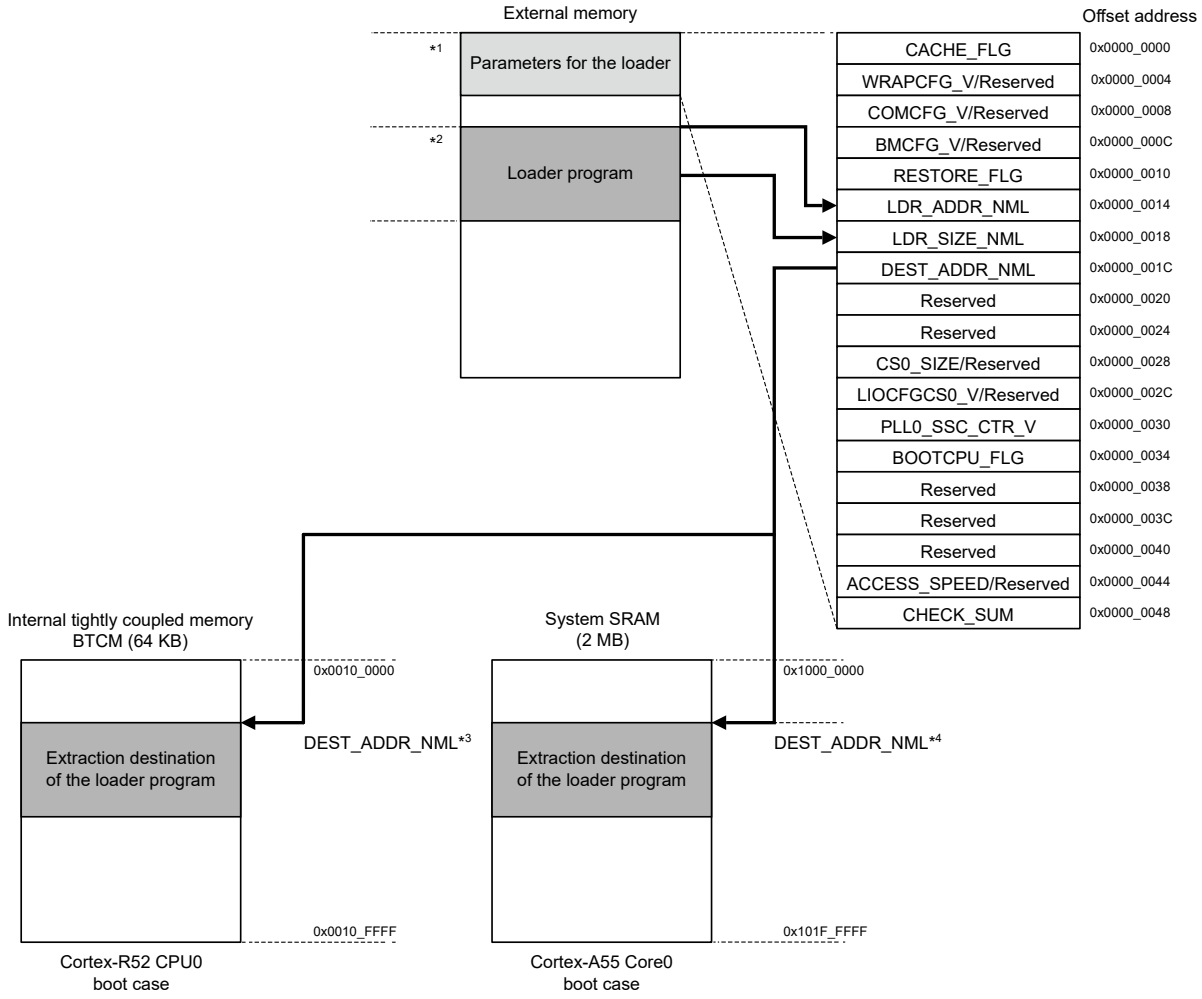
Note: (1) Set the boot peripheral (xSPI or SDHI) specified by the operation mode.
(2) Transfer the parameters for the loader from an external memory.
(3) Configure the boot peripheral on the parameters for the loader.
(4) Transfer the loader program from an external memory.
(5) When Cortex-A55 is selected as second boot CPU, release the reset of Cortex-A55 Core0 and transition Cortex-R52 CPU0 to the WFI state. Then, hand over the second boot CPU processing to the loader program in the TCM area (Cortex-R52 CPU0 boot mode case) or SYSRAM area (Cortex-A55 Core0 boot Mode case).

Figure 4.1 Operating overview of boot processing

4.6.2 Parameters for the Loader

The parameters for the loader are setting parameters for boot processing, which are loaded from an external memory during boot processing and used by the boot function. The parameters for the loader specify information, such as the cache settings during boot processing in individual operating modes, setting of the boot peripheral (xSPI or SDHI) used for communication with an external memory, and the size of the loader program.

Figure 4.2 shows memory assignment of the loader program and parameters for the loader.



Note 1. The parameters for the loader must be stored in the following address range:

xSPI boot mode: xSPI0 or xSPI1 space (0x4000_0000 and higher or 0x5000_0000 and higher)

eSD boot mode: Sector 1 to 7 for multiplexing

eMMC boot mode: Sector 1

Note 2. The loader program can be stored in any address for xSPI boot mode and in 512 byte align address for eSD/eMMC boot mode.

For details, see section 4.6.5. eSD Boot Mode and section 4.6.6. eMMC Boot Mode.

The program size (LDR_SIZE_NML) must be multiples of 512 bytes. Maximum size is 52 KB for BTCM and 2036 KB for SYSRAM.

Note 3. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_EFFF for Cortex-R52 CPU0 boot case.

Note 4. Specify the extraction destination area of the loader program so that the area falls in the range from 0x1000_0000 to 0x101F_CFFF for Cortex-A55 Core0 boot case.

Figure 4.2 Memory assignment of the loader program and parameters for the loader

Table 4.8 describes parameter information for the loader in xSPI boot mode. Table 4.9 describes parameter information for the loader in eSD/eMMC boot mode.

Table 4.8 Parameter information for the loader in xSPI boot mode (1 of 3)

Offset address	Parameter name	Description
0x0000_0000	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R52 at boot processing (for speeding up). 0x0000_0001: Enables the I1 and D1 caches. Setting values other than above: Disables the I1 and D1 caches.

Table 4.8 Parameter information for the loader in xSPI boot mode (2 of 3)

Offset address	Parameter name	Description
0x0000_0004	WRAPCFG_V	Setting value of the xSPI Wrapper Configuration register (WRAPCFG). This parameter value is set to the DSSFTCS0[4:0] bits in the WRAPCFG register during the setting for speeding up of xSPI in (3) of section 4.6.1. Boot Function *1. The bit 13 of WRAPCFG_V is used as the flag. In case of WRAPCFG_V[13] = 0: This parameter value is ignored and kept the reset value. In case of WRAPCFG_V[13] = 1: This parameter value is valid and set to the WRAPCFG register. The DSSFTCS1[4:0] bits in the WRAPCFG register remain the reset value.
0x0000_0008	COMCFG_V	Setting value of the xSPI Common Configuration register (COMCFG). This parameter value is set to the COMCFG register during the setting for speeding up of xSPI in (3) of section 4.6.1. Boot Function *1.
0x0000_000C	BMCFG_V	Setting value of the xSPI Bridge Map Configuration register (BMCFG). This parameter value is set to the PREEN bit in the BMCFG register during the setting for speeding up of xSPI in (3) of section 4.6.1. Boot Function *1. The other bits in the BMCFG register remain the reset value.
0x0000_0010	RESTORE_FLG	Selects whether to change the xSPI setting back to the initial value after the boot processing finishes. 0x2236_0679: Changes the xSPI setting value back to the initial value after the boot processing finishes. Setting values other than above: Retains the xSPI setting value used during boot processing.*2
0x0000_0014	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.
0x0000_0018	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes. Maximum size is 52 KB for BTCM in Cortex-R52 CPU0 boot case and 2036 KB for SYSRAM in Cortex-A55 Core0 boot case.*3
0x0000_001C	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) in Cortex-R52 CPU0 boot case or System SRAM (SYSRAM) in Cortex-A55 Core0 boot case that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_EFFF in BTCM for Cortex-R52 CPU0 boot case or from 0x1000_0000 to 0x101F_CFFF in SYSRAM for Cortex-A55 Core0 boot case. The address should be 4-byte aligned. If loader program is Thumb, bit0 should be flagged to 1.
0x0000_0020	Reserved	Should be 0x0000_0000
0x0000_0024	Reserved	Should be 0x0000_0000
0x0000_0028	CS0_SIZE	Sets the size of the device attached to xSPI CS0 area. Value added base address (0x4000_0000 for xSPI0 or 0x5000_0000 for xSPI1) to this parameter value is set to the CS0ENDAD register during the setting for speeding up of xSPI in (3) of section 4.6.1. Boot Function*1. Value should be less than 0x0800_0000.
0x0000_002C	LIOCFGCS0_V	Setting value of the xSPI link I/O Configuration Register CS0 (LIOCFGCS0). This parameter value is set to the LIOCFGCS0 register during the setting for speeding up of xSPI in (3) of section 4.6.1. Boot Function*1. This parameter is effective on only bit 31 to bit 16 of LIOCFGCS0 register. Bit 11 to bit 0 are fixed each boot mode (x1 or x8). The bit 14 of LIOCFGCS0_V is used as the flag. In case of LIOCFGCS0_V[14] = 0: This parameter value is ignored and kept the reset value. In case of LIOCFGCS0_V[14] = 1: This parameter value is valid and set to the LIOCFGCS0 register.
0x0000_0030	PLL0_SSC_CTR_V	Setting value of the PLL0 SSC Control Register (PLL0_SSC_CTR). This parameter value is set to the PLL0_SSC_CTR register during (3) of section 4.6.1. Boot Function when the second boot CPU is selected Cortex-A55 Core0.
0x0000_0034	BOOTCPU_FLG	Selects the second boot CPU. 0x0000_0000: Cortex-R52 CPU0 0x0000_0001: Cortex-A55 Core0 Setting values other than above: Prohibited
0x0000_0038	Reserved	Should be 0x0000_0000
0x0000_003C	Reserved	Should be 0x0000_0000

Table 4.8 Parameter information for the loader in xSPI boot mode (3 of 3)

Offset address	Parameter name	Description
0x0000_0040	Reserved	Should be 0x0000_0000
0x0000_0044	ACCESS_SPEED	This parameter is used to adjust access speed for the external memory. For xSPI boot mode using xSPI0, this value is set to FSELXSPI0[2:0] bits and DIVSELXSPI0 bit of SCKCR register. For example, Bit 6: DIVSELXSPI0 = 0 The base clock to generate serial clock is 800 MHz. Bits [2:0]: FSELXSPI0[2:0] = 100b. The clock frequency is 50.0 MHz. Other bit: Is not used to set SCKCR register. For xSPI boot mode using xSPI1, set bit 6 and bits [2:0] of this parameter as well as xSPI0 to set FSELXSPI1[2:0] bits and DIVSELXSPI1 bit of SCKCR register. Bit 14 and bits [10:8] of this parameter are ignored.
0x0000_0048	CHECK_SUM	CHECK_SUM value of the parameters for the loader This parameter specifies the sum of the upper-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0x0000 to 0x0044.

Note 1. For details on the WRAPCFG, COMCFG, BMCFG, CS0ENDAD, and LIOCFGCS0 registers, see section 37, Expanded Serial Peripheral Interface (xSPI) (n = 0, 1).
Note 2. For details about the setting status of the individual peripheral modules after the boot processing finishes, see section 4.6.4. xSPI Boot Mode.
Note 3. The loader program must be in the range from 0x4000_004C to 0x40FF_FE00 (xSPI0) or 0x5000_004C to 0x50FF_FE00 (xSPI1) in the external address space.

Table 4.9 Parameter information for the loader in eSD or eMMC boot mode (1 of 2)

Offset address	Parameter name	Description
0x0000_0000	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R52 at boot processing (for speeding up). 0x0000_0001: Enables the I1 and D1 caches. Setting values other than above: Disables the I1 and D1 caches.
0x0000_0004	Reserved	Should be 0x0000_0000
0x0000_0008	Reserved	Should be 0x0000_0000
0x0000_000C	Reserved	Should be 0x0000_0000
0x0000_0010	RESTORE_FLG	Selects whether to change the SDHI setting back to the initial value after the boot processing finishes. 0x2236_0679: Changes the SDHI setting value back to the initial value after the boot processing finishes. Setting values other than above: Retains the SDHI setting value used during boot processing*1.
0x0000_0014	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.
0x0000_0018	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes. Maximum size is 52 KB for BTCM in Cortex-R52 CPU0 boot case and 2036 KB for SYSRAM in Cortex-A55 Core0 boot case*2.
0x0000_001C	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) or System SRAM (SYSRAM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_EFFF in BTCM for Cortex-R52 CPU0 boot case or from 0x1000_0000 to 0x101F_CFFF in SYSRAM for Cortex-A55 Core0 boot case.
0x0000_0020	Reserved	Should be 0x0000_0000
0x0000_0024	Reserved	Should be 0x0000_0000
0x0000_0028	Reserved	Should be 0x0000_0000
0x0000_002C	Reserved	Should be 0x0000_0000
0x0000_0030	PLL0_SSC_CTR_V	Setting value of the PLL0 SSC Control Register (PLL0_SSC_CTR). This parameter value is set to the PLL0_SSC_CTR register during (3) of section 4.6.1. Boot Function when the second boot CPU is selected Cortex-A55 Core0.

Table 4.9 Parameter information for the loader in eSD or eMMC boot mode (2 of 2)

Offset address	Parameter name	Description
0x0000_0034	BOOTCPU_FLG	Selects the second boot CPU. 0x0000_0000: Cortex-R52 CPU0 0x0000_0000: Cortex-A55 Core0 Setting values other than above: Prohibited
0x0000_0038	Reserved	Should be 0x0000_0000
0x0000_003C	Reserved	Should be 0x0000_0000
0x0000_0040	Reserved	Should be 0x0000_0000
0x0000_0044	Reserved	Should be 0x0000_0000
0x0000_0048	CHECK_SUM	CHECK_SUM value of the parameters for the loader This parameter specifies the sum of the upper-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0x0000 to 0x0044.

Note 1. For details about the setting status of the individual peripheral modules after the boot processing finishes, see section 4.6.5. eSD Boot Mode and section 4.6.6. eMMC Boot Mode.

Note 2. The loader program must be placed at sector 8 or after for eSD boot mode and at sector 2 or after for eMMC boot mode. For details, see section 4.6.5. eSD Boot Mode and section 4.6.6. eMMC Boot Mode.

4.6.3 Loader Program

The loader program is a user program that is transferred from an external memory to the internal tightly coupled memory (TCM) or System SRAM (SYSRAM) by the boot function and starts its processing after the boot processing finishes. The loader program can execute such processing that suits the user system, for example, extracting a user application program from an external memory to the internal TCM area or System SRAM (SYSRAM) and executing it at high speed.

Set the loader program so that the following conditions are satisfied:

Program size (LDR_SIZE_NML)	Multiples of 512 bytes. Maximum size is 52 KB for BTCM in Cortex-R52 CPU0 boot case and 2036 KB for SYSRAM in Cortex-A55 Core0 boot case.
Storage address in the external memory (LDR_ADDR_NML) in xSPI0 boot mode	Address range from 0x4000_004C to 0x40FF_FE00
Storage address in the external memory (LDR_ADDR_NML) in xSPI1 boot mode	Address range from 0x5000_004C to 0x50FF_FE00
Storage address in the eSD memory (LDR_ADDR_NML) in eSD boot mode	Sector 8 or after. (Address should be 512byte aligned)
Storage address in the eMMC memory (LDR_ADDR_NML) in eMMC boot mode	Sector 2 or after. (Address should be 512byte aligned)

These setting values must be stored in an external memory as parameters for the loader. For details, see section 4.6.2. Parameters for the Loader.

4.6.4 xSPI Boot Mode

4.6.4.1 x1 Boot Serial Flash

In xSPI boot mode with x1 boot serial flash, this LSI boots a program from an external serial flash memory connected to the expanded Serial Peripheral Interface (xSPI0 or xSPI1) space CS0 with single, dual, quad, or octal data signals. In this mode, used protocol is 1S-1S-1S regardless of number of data signals of the flash. The xSPI controller is set to the mode of reading the external address space, and the XSPI0_CKP, XSPI0_CS0#, and XSPI0_IO[1:0] pins are enabled for MD[2:0] = 000b. XSPI1_CKP, XSPI1_CS0#, and XSPI1_IO[1:0] pins are enabled for MD[2:0] = 010b.

After the reset is released, the LSI executes the boot processing on Cortex-R52 CPU0. The program stored in a serial flash memory connected to the expanded SPI space is extracted to the internal tightly coupled memory (TCM) or System SRAM (SYSRAM), and then the processing is executed.

Figure 4.3 shows the connection diagram of this LSI with a serial flash memory.

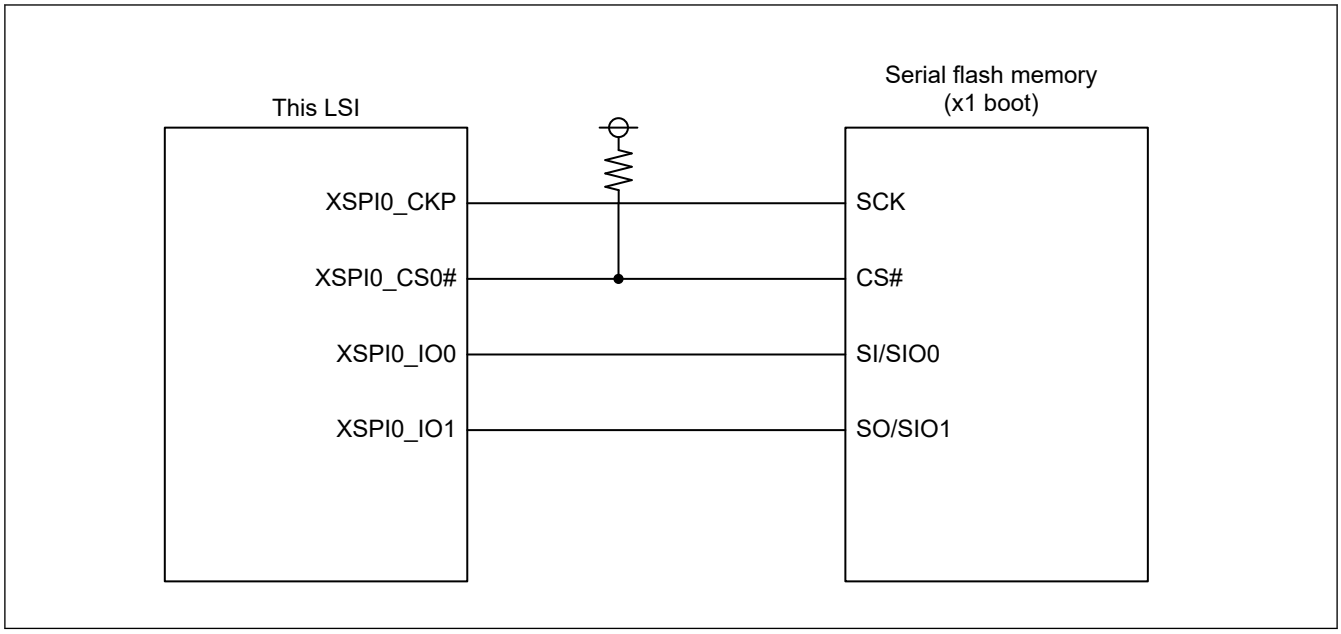


Figure 4.3 Connection diagram of this LSI with x1 boot serial flash memory

4.6.4.2 x8 Boot Serial Flash

In xSPI boot mode with x8 boot serial flash, this LSI boots a program from an external x8 serial flash memory such as HyperFlash and xSPI 8D-8D-8D profile 2.0 compliant device connected to the expanded Serial Peripheral Interface (xSPI0) space CS0 with octal data signals. In this mode, the xSPI0 controller is set to the mode of reading the external address space, and the XSPI0_CKP, XSPI0_CKN, XSPI0_CS0#, XSPI0_IO[7:0], XSPI0_DS, and XSPI0_RESET0# pins are enabled.

After the reset is released, the LSI executes the boot processing on Cortex-R52 CPU0. The program stored in a serial flash memory connected to the expanded SPI space is extracted to the internal tightly coupled memory (TCM) or System SRAM (SYSRAM), and then the processing is executed.

Figure 4.4 shows the connection diagram of this LSI with a serial flash memory.

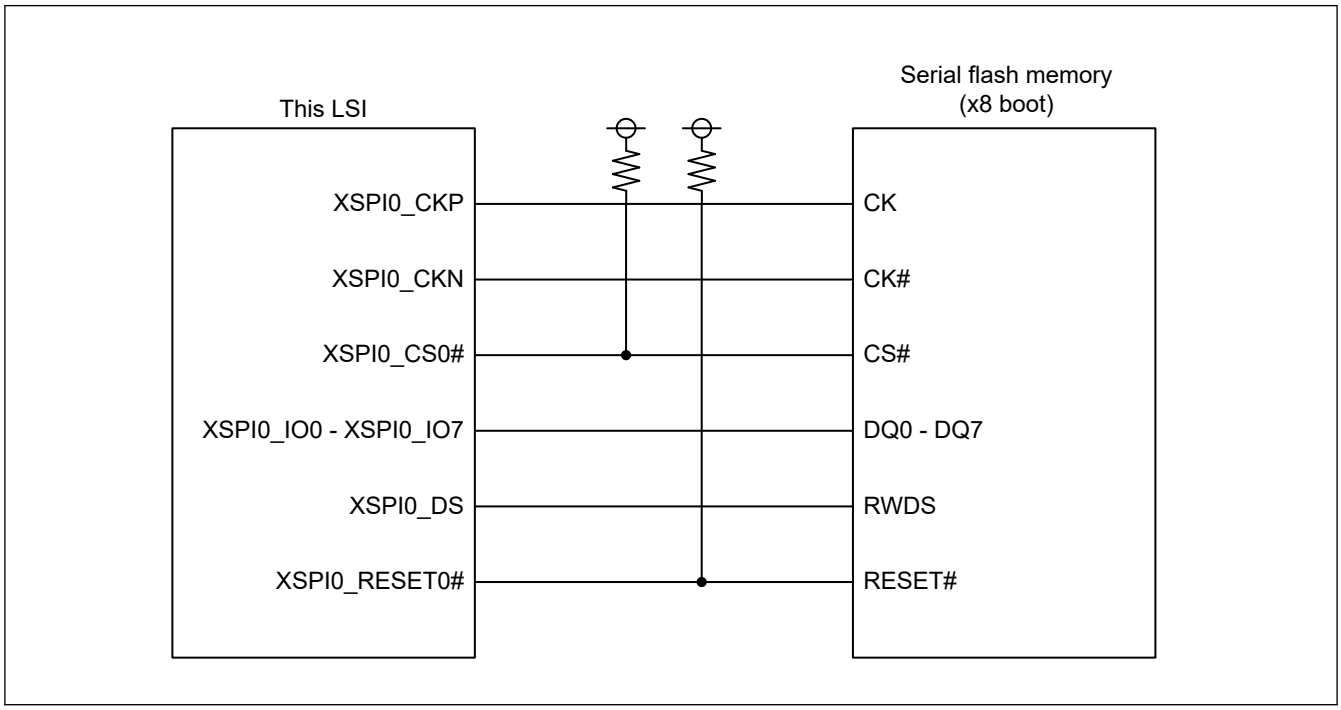

Figure 4.4 Connection diagram of this LSI with x8 boot serial flash memory

4.6.4.3 Operation Settings in xSPI Boot Mode

Immediately after the boot processing starts in xSPI boot mode after the reset is released, the LSI operates with the following initial setting values and executes processing until it transfers parameters for the loader.

Items	x1 boot	x8 boot
CPU clock (CPU0CLK)	500 MHz	
xSPI bit rate (XSPI_CLKn)	12.5 MHz*1	
Supported command	Read (0x03)	Read (CA[47:45] = 101b)
Command output	1 byte	6 bytes
Address output	3 bytes	
Dummy cycle (Read latency cycle)	0	10 Latency cycle increments from CA[23:16]
Initial data width	1 bit	8 bits
Protocol	1S-1S-1S	8D-8D-8D profile 2.0
Driving edge	Falling edge of XSPIn_CKP	Both edges of XSPI0_CKP
Sampling edge	Falling edge of XSPIn_CKP	Both edges of XSPI0_DS with shift*2
Flash reset	Software (0x66 + 0x99)	Hardware by XSPI0_RESET0#

Note 1. Serial clock frequency is configurable in parameter.
Note 2. DS shift size is configurable in parameter.

Table 4.10 describes the setting values of the related peripheral modules and registers at the time the xSPI boot mode finishes.

Table 4.10 Setting register values of the related peripheral modules when xSPI boot mode finishes (1 of 2)

Peripheral module	Register	When xSPI is initialized (RESTORE_FLG = 0x22360679)		When xSPI is not initialized (RESTORE_FLG ≠ 0x22360679)	
		x1	x8	x1	x8
xSPI	WRAPCFG	0x00000000 (initial value)	0x00000000 (initial value)	Setting value of WRAPCFG_V (only DSSFTCS0[4:0] bits) If flag bit is not set, 0x00000000.	Setting value of WRAPCFG_V (only DSSFTCS0[4:0] bits) If flag bit is not set, 0x00001F00.
	COMCFG	0x00000000 (initial value)	0x00000000 (initial value)	Setting value of COMCFG_V	Setting value of COMCFG_V
	BMCFG	0x00000000 (initial value)	0x00000000 (initial value)	Setting value of BMCFG_V (only PREEN bit)	Setting value of BMCFG_V (only PREEN bit)

Note 1. For details, see section 17.7.6.1. Pin Assignment for xSPI Boot Mode.
Note 2. In case the second boot CPU is Cortex-A55 Core0.

4.6.5 eSD Boot Mode

In eSD boot mode, this LSI boots a program from an external eSD device with 4-bit data bus. The operating voltage is set to 3.3V and not changed during boot process. This LSI supports the embedded SD (eSD) defined in the SD Specification Part 1 eSD Addendum (Version 2.10). In this mode, the SD1_CLK, SD1_CMD, and SD1_DATA[3:0] pins are enabled.

After the reset is released, the LSI executes the boot processing on Cortex-R52 CPU0. The eSD device connected to the SDHI1 interface is mounted and issued a read command to obtain the loader parameter from sector 1 of the selected partition. After obtaining the loader parameter, loader program stored in the embedded SD is extracted to the internal tightly coupled memory (TCM) or System SRAM (SYSRAM) dependent on the selected second boot CPU, and then the processing is executed. In this mode, PLL2 is automatically activated with disabled SSC.

Figure 4.5 shows the connection diagram of this LSI with embedded SD (eSD) device.

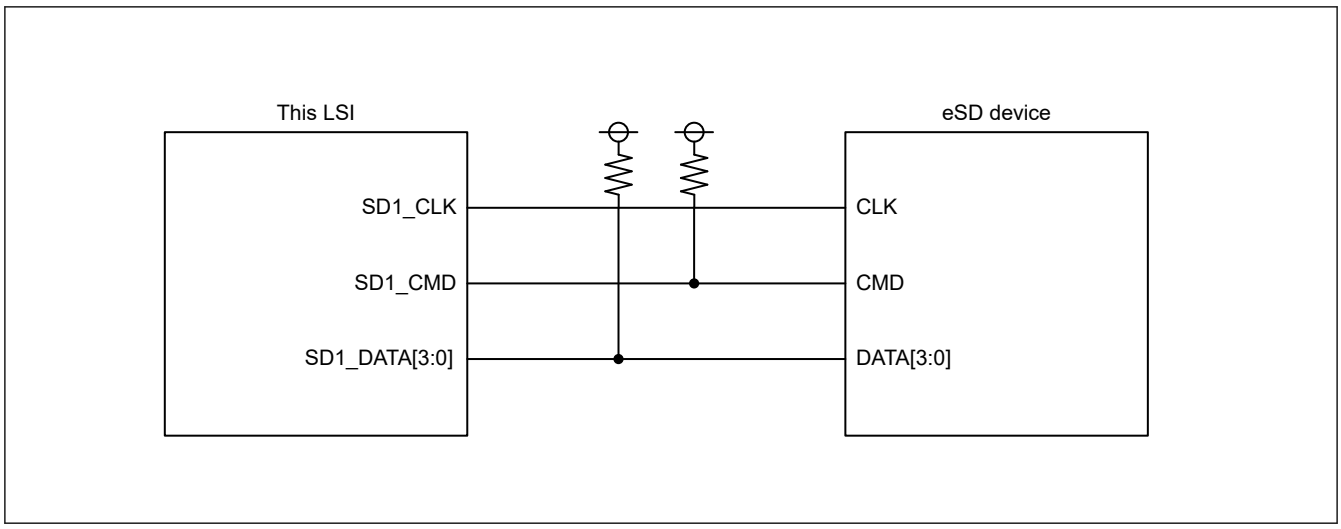

Figure 4.5 Connection diagram of this LSI with eSD device

4.6.5.1 Allocation of the Loader Parameter and Loader Program

(1) Allocation in eSD V2.0 (Single Partition)

Figure 4.6 shows the allocation of the loader parameter and loader programs in the eSD device conforming to the eSD V2.0 standard. To prevent read-disturb errors, up to seven loader parameter and loader programs can be multiplexed and written to the eSD device.

The loader parameters are allocated to sectors 1 to 7 in physical partition #0 of the eSD device. If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader parameter in a single area, another loader parameter is transferred from the next multiplexed area.

The loader programs are allocated to address specified in the loader parameter (sector 8 or after). If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader parameter in a single area, another loader program is transferred from the next multiplexed area.

Note that even when the loader parameter is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.

Figure 4.7 shows the structure of the loader parameter in a sector. First 76 bytes defined in Table 4.9 are valid and the rest is not used.

(2) Allocation in eSD V2.1 (Multi Partitions)

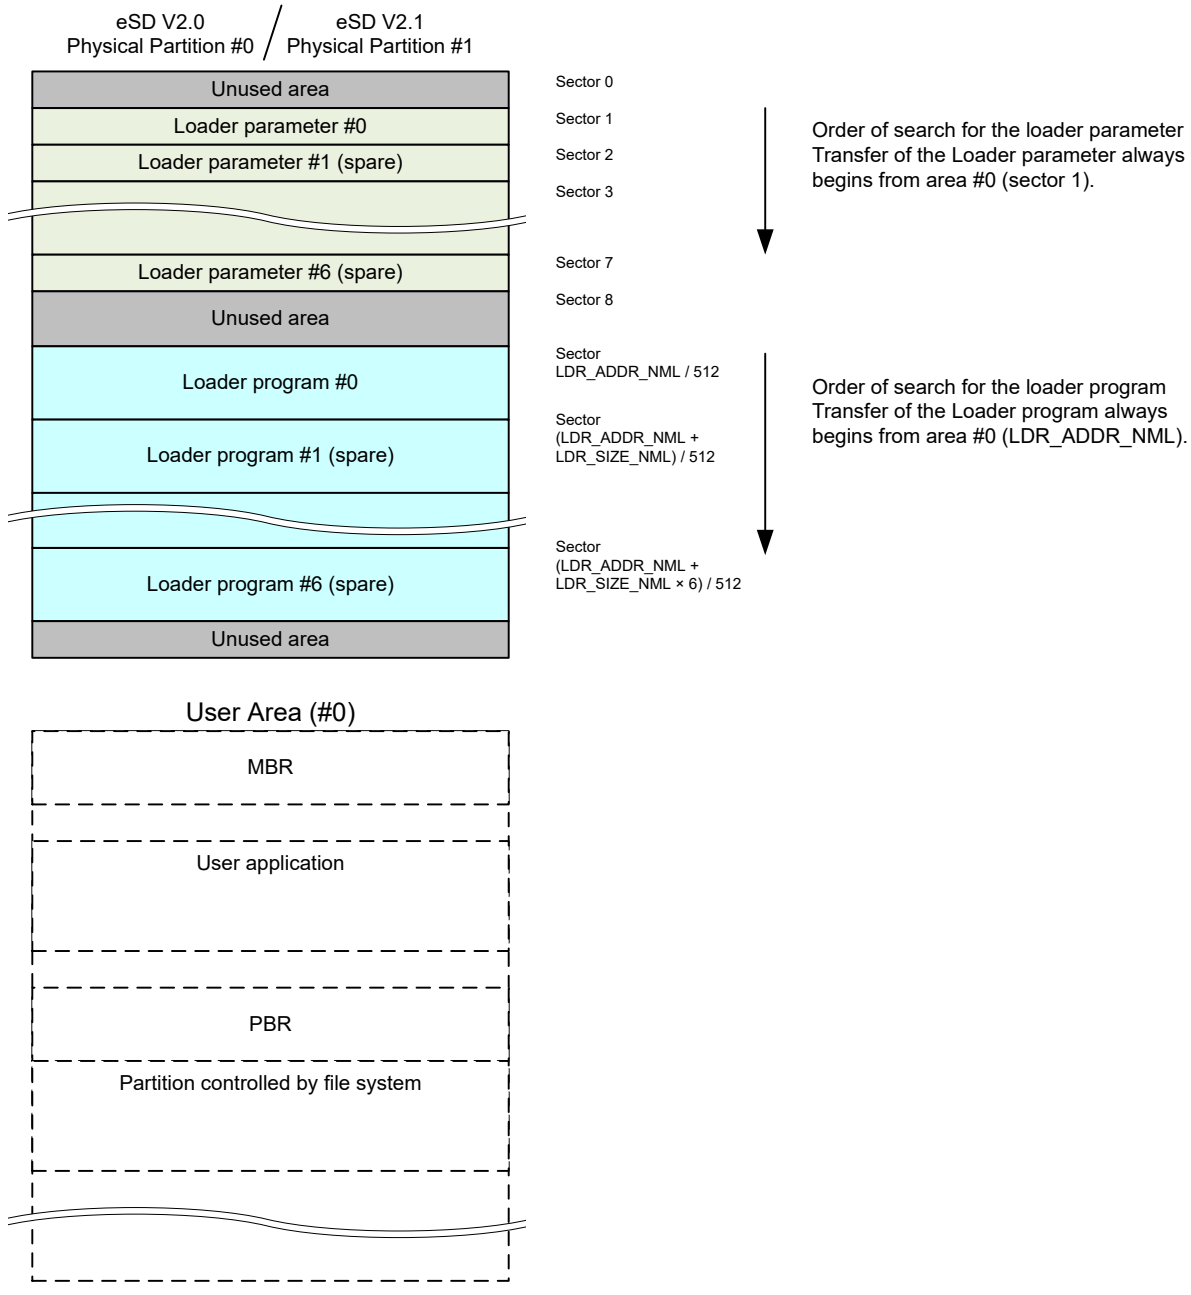
Basically, same as eSD V2.0 standard except physical partition number to be transferred from. In case of eSD V2.1, loader parameter and loader program are transferred from physical partition #1 of the eSD device.

(3) How to Distinguish between eSD V2.0 (Single Partition) and V2.1 (Multi Partitions)

This boot program first assumes that an eSD device supporting multi partitions is connected and begins loader parameter transfer from physical partition #1. If an error regarding a command for multi partitions shown in the Table 4.11 occurs, the boot program assumes that an eSD device with a single partition is connected and transfers the loader program from physical partition #0.

Table 4.11 Errors regarding commands for multi partitions

No.	Issued Command	Command Function	Error
1	CMD43 (SELCT_PARTITION)	Selects physical partition #1.	Multi partitions are not supported.
2	CMD45 (QUERY_PARTITION)	Obtains the physical partition ID.	The specified partition does not exist.



Note: Write the same data to loader parameter areas #0 to #6.
Write the same data to loader program areas #0 to #6.
The start sector location of the loader program #n is (LDR_ADDR_NML + LDR_SIZE_NML × n) / 512.

Figure 4.6 Allocation of loader parameter and loader program in the eSD device

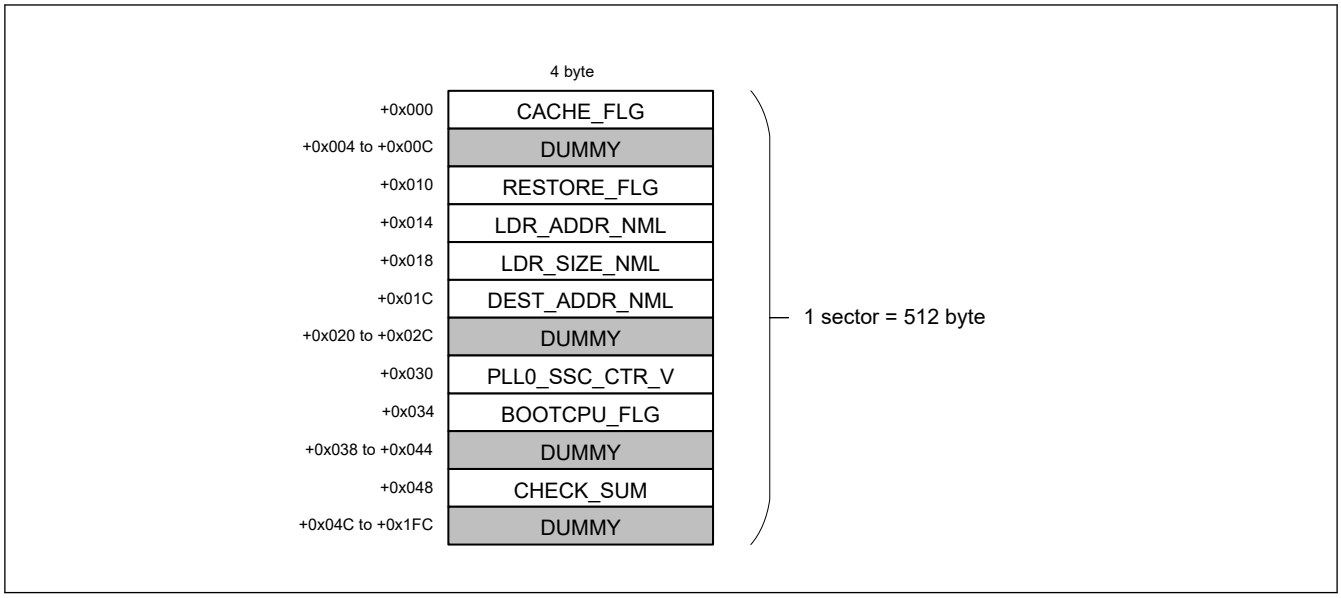


Figure 4.7 Structure of the loader parameter area

4.6.5.2 Operation Settings in eSD Boot Mode

Table 4.12 describes the setting values of the related peripheral modules and registers at the time when eSD boot mode finishes.

Note 1. For details, see section 17.7.6.2. Pin Assignment for eSD/eMMC Boot Mode
Note 2. In case the second boot CPU is Cortex-A55 Core0.

4.6.6 eMMC Boot Mode

In eMMC boot mode, this LSI boots a program from an external eMMC device with 8-bit data bus. The operating voltage is fixed to 1.8 V or 3.3 V and MDV pin must be set to Low in case of 1.8 V and High in case of 3.3 V. This LSI supports the eMMC that operates in the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4). In this mode, the SD0_CLK, SD0_CMD, SD0_DATA[7:0], and SD0_RST# pins are enabled.

After the reset is released, the LSI executes the boot processing on Cortex-R52 CPU0. Boot process starts alternative boot operation mode of the eMMC device, and read access begins from sector 0 of the partition selected by the [179] field (PARTITION_CONFIG) of the extended CSD (EXT_CSD) register in the eMMC device.

After dummy read from sector 0, the loader parameter is read from sector 1. According to the loader parameter, loader program stored in the eMMC device is extracted to the internal tightly coupled memory (TCM) or System SRAM (SYSRAM) dependent on the selected second boot CPU, and then the processing is executed. In this mode, PLL2 is automatically activated with disabled SSC.

Figure 4.8 shows the connection diagram of this LSI with eMMC device.

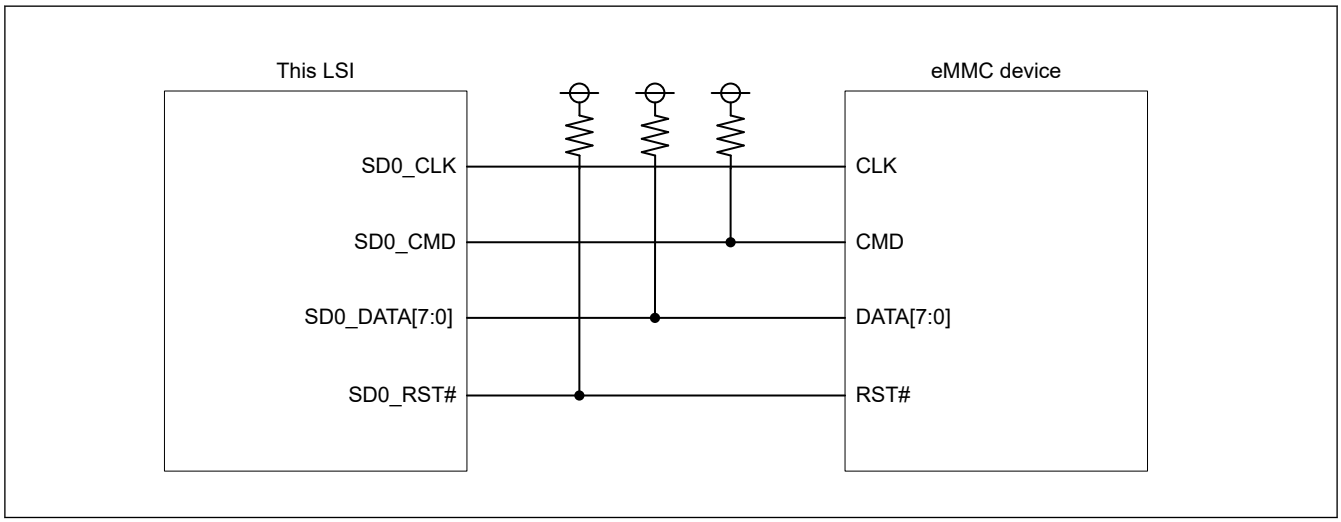

Figure 4.8 Connection diagram of this LSI with eMMC device

4.6.6.1 Allocation of the Loader Parameter and Loader Program

Figure 4.9 shows the allocation of the loader program in the eMMC device conforming to the MMCA 4.4 standard.

The loader parameters are allocated to sectors 1 in boot partition 1 or 2 of the eMMC device. A dummy read from sector 0 is done, and then loader parameter is read from sector 1.

The loader program is allocated to the address specified in the loader parameter (sector 2 or after).

The structure of the loader parameter in a sector for eMMC boot mode is same for eSD boot mode shown in Figure 4.7. First 76 bytes defined in Table 4.9 are valid and the rest is not used.

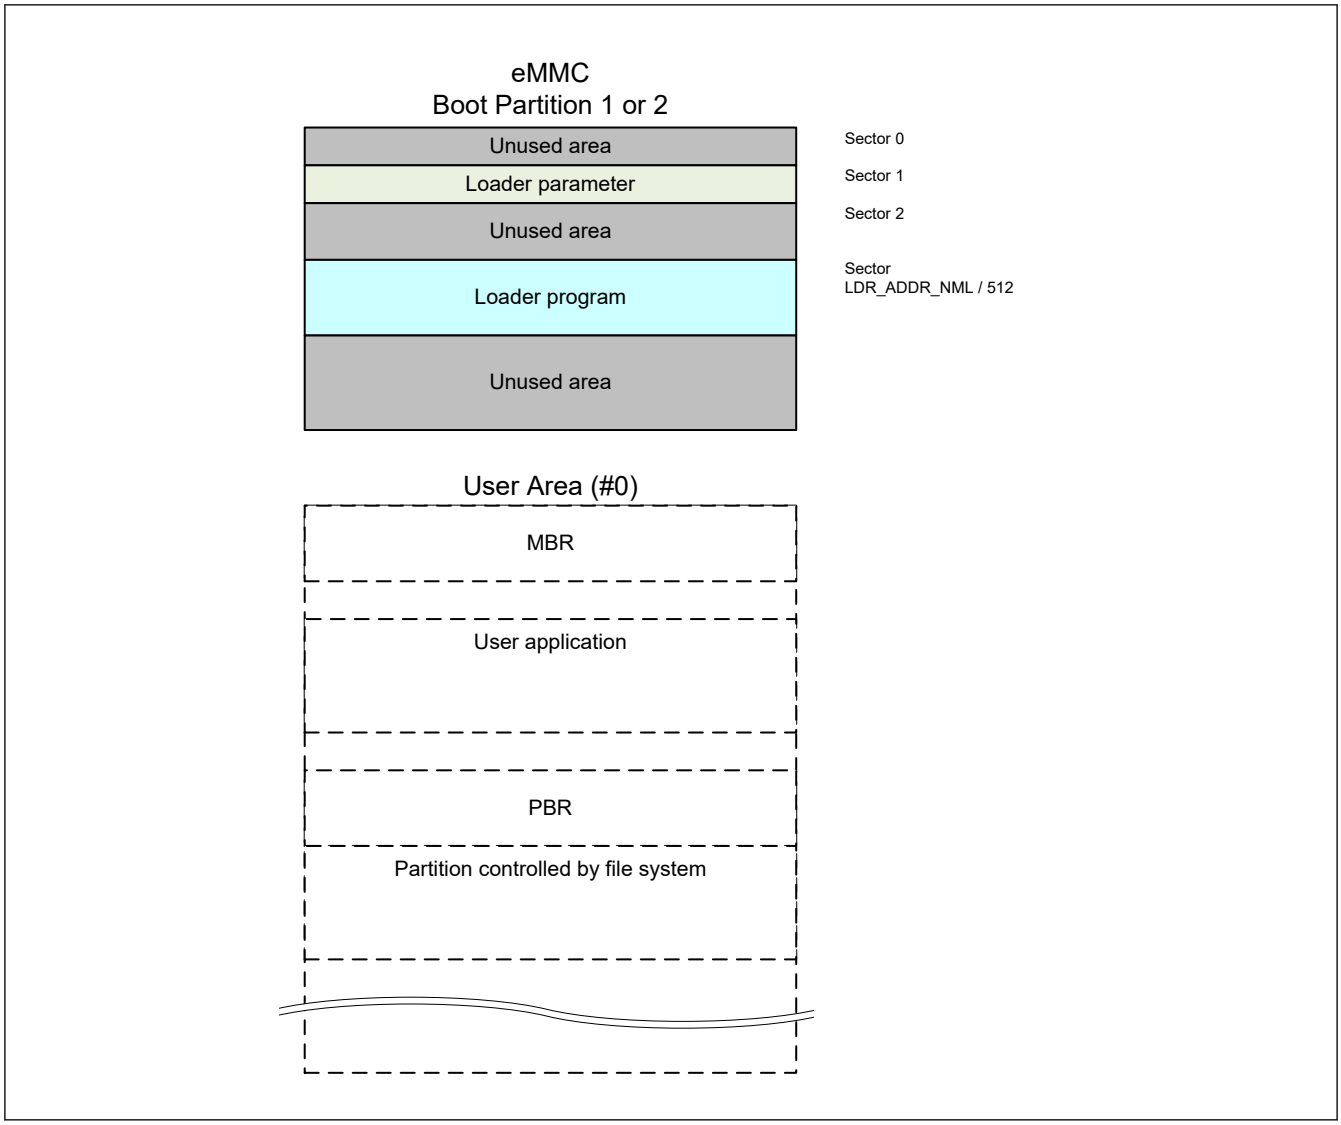

Figure 4.9 Allocation of loader parameter and loader program in the eMMC Device

In the eMMC device, the loader parameter and loader program are read from the partition specified by the BOOT_PARTITION_ENABLE bits in the PARTITION_CONFIG (ECSD[179]) field of the extended CSD register. Write the loader parameter and loader program to the partition selected by this register.

Boot ROM uses the alternative boot operation and sets up the registers in SDHI0 so that the SDHI operates with an 8-bit bus width when booting from the eMMC device. On the eMMC device side, the data bus width in the alternative boot operation is determined by the setting of the BOOT_BUS_WIDTH[177] field in the extended CSD register. To boot up from the eMMC device correctly, set up the extended CSD register in the eMMC device when writing a program to the eMMC device.

Boot Ack is not detected in this LSI. The output of Boot Ack from the eMMC device can be specified in the PARTITION_CONFIG[179] field. Be sure to stop the output of Boot Ack by using this field.

Table 4.13 shows the setting of the extended CSD register.

Table 4.13 Setting of the Extended CSD Register

No.	Field name	Bit name	Setting
1	PARTITION_CONFIG (ECSD[179])	BOOT_PARTITION_ENABLE bits [5:3]	0x0: Device not boot enabled (default) 0x1: Boot partition 1 enabled for boot 0x2: Boot partition 2 enabled for boot 0x7: User area enabled for boot
		BOOT_ACK bit 6	Set to 0 (The eMMC device does not output a boot acknowledge in the alternative boot operation.)
2	BOOT_BUS_WIDTH (ECSD[177])	BOOT_BUS_WIDTH bits [1:0]	Set to 10b (Bus width is set to 8-bit in alternative boot operation.)

It is recommended to allocate partitions as follows.

- Store the loader parameter and loader program in boot partition 1.
- Store the application program in boot partition 2.
- Allocate the user area to a partition controlled by the file system.

4.6.6.2 Operation Settings in eMMC Boot Mode

Table 4.14 describes the setting values of the related peripheral modules and registers at the time when eMMC boot mode finishes.

Table 4.14 Setting register values of the related peripheral modules when eMMC boot mode finishes (1 of 2)

Peripheral module	Register	When SDHI is initialized (RESTORE_FLG = 0x22360679)	When SDHI is not initialized (RESTORE_FLG ≠ 0x22360679)

Note 1. For details, see section 17.7.6.2. Pin Assignment for eSD/eMMC Boot Mode
Note 2. In case the second boot CPU is Cortex-A55 Core0.

4.6.7 SCI (UART) Boot Mode

The SCI (UART) Boot mode supports download and executes the loader program using SCI0 (UART) interface, which can be directly executed in internal memory. When the LSI transmits the start message to the PC by serial communication, the PC starts to transmit the loader program and it is transferred to the internal tightly coupled memory (BTCM) or System SRAM (SYSRAM). After completion of the transmission, the processing of the loader program is executed.

Figure 4.10 shows the connection diagram of this LSI with a PC.

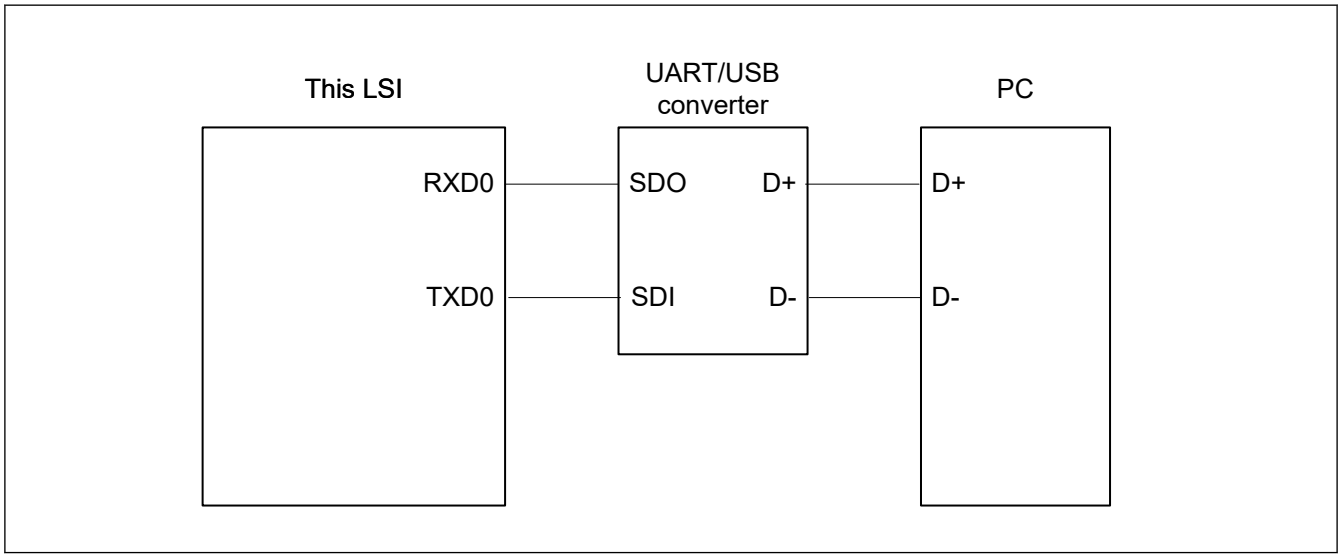

Figure 4.10 Connection diagram of this LSI with a PC

4.6.7.1 Operation Setting in SCI Boot Mode

After the reset is released, if the boot processing starts in SCI boot mode, the following setting values are used:

- CPU clock (CPU0CLK): 500 MHz
- SCI mode: Asynchronous mode
- Start bit: 1 bit
- Parity bit: None
- Data: 8 bits
- Stop bit: 1 bit
- Baud rate: 115200 bps

4.6.7.2 Boot Procedure

This boot procedure assumes using terminal emulator.

Table 4.15 SCI boot procedure

Steps	What to do
1	PC will receive "SCI Download mode (Normal SCI boot)" message after power-on-reset is released and LSI initialization is done on SCI boot mode.
2	The LSI waits to receive "HDR NM" data of Motorola S-record format, S0 record type, from the PC.
3	After received the data, the LSI will send out the following message to the PC. "--- Load Program to RAM ----------"
4	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC. The received data will be changed to binary data and forwarded to internal memory.
5	When SCI boot program receives destination address by Motorola S-record format, S7 record type, that is a notification from the PC to terminate the transfer.
6	The LSI will send out the following message to the PC. "--- Start Boot Program on RAM ----------"
7	An end process is executed and the loader program is transferred to BTCM or SYSRAM.

Note: See section 4.6.9. Motorola S-record Format for SCI/USB Boot about S-record format.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- SCI communication error
- Receive Motorola S-record format except S0, S3, and S7 record
- Check sum error of S-record format
- Addressing: Outside of BTCM or SYSRAM area
- Loader program size: Outside of BTCM or SYSRAM capacity

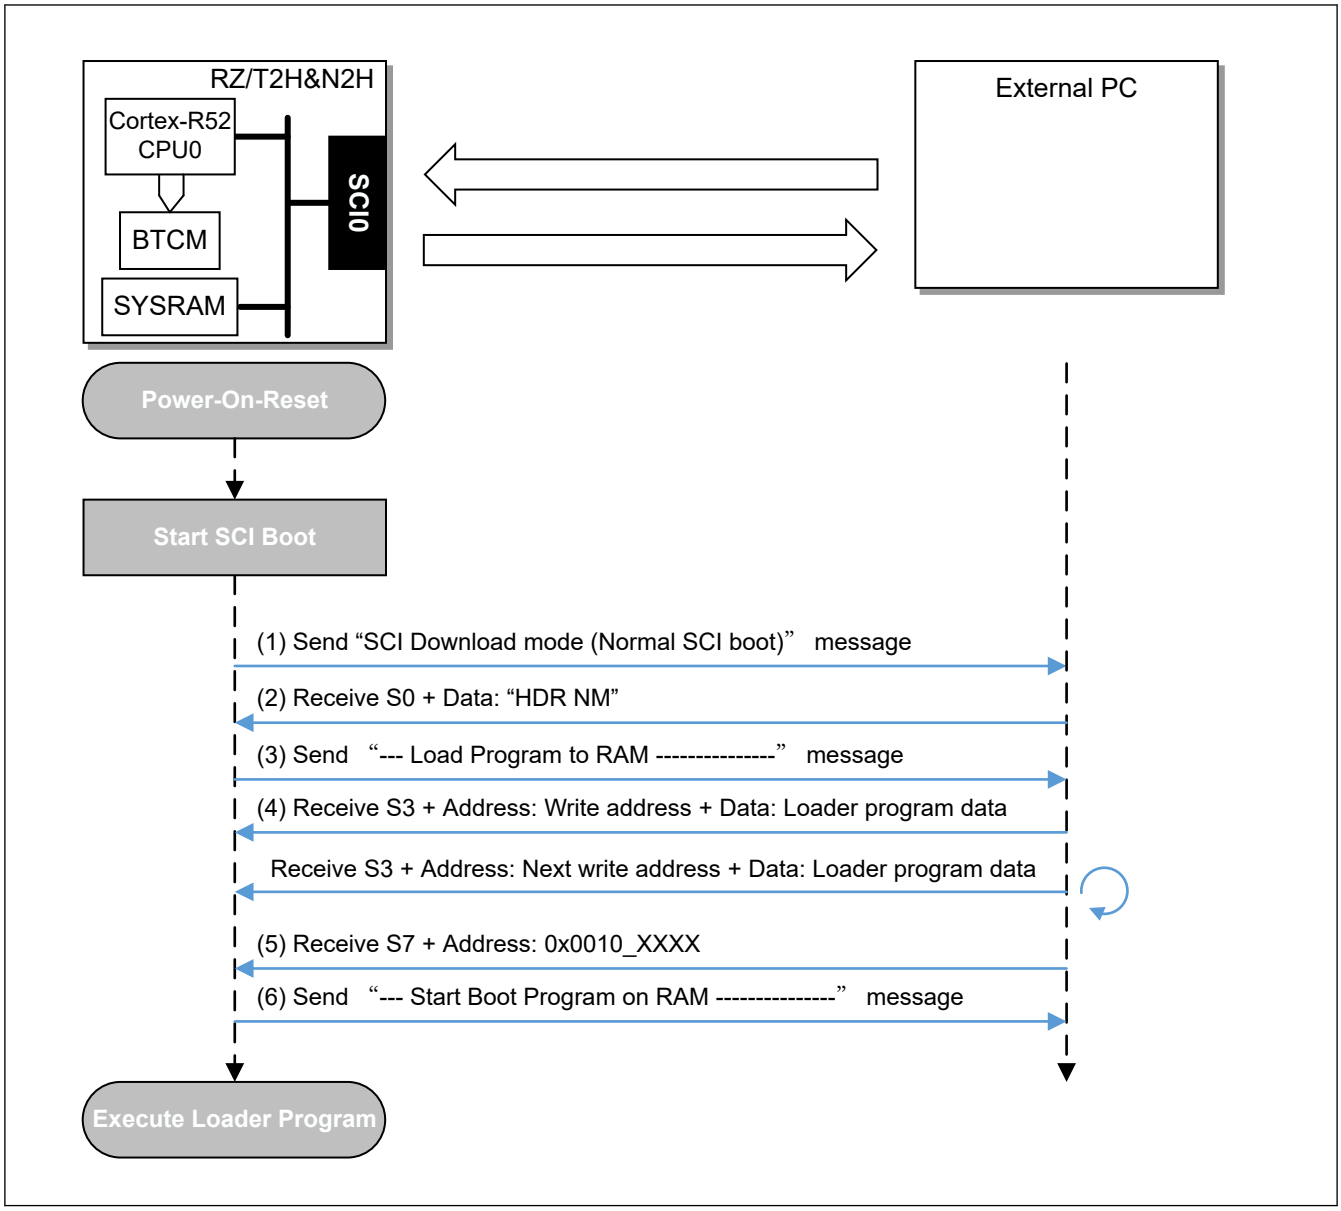

Figure 4.11 SCI boot sequence

4.6.8 USB Boot Mode

The USB Boot mode supports download and executes the loader program using the USB 2.0 interface, which can be directly executed in internal memory. When the LSI receives the Open request from PC, the LSI transmits the start message to the PC. The PC starts to transmit the loader program and it is transferred to the internal tightly coupled memory (BTCM) or System SRAM (SYSRAM). After completion of the transmission, the processing of the loader program is executed.

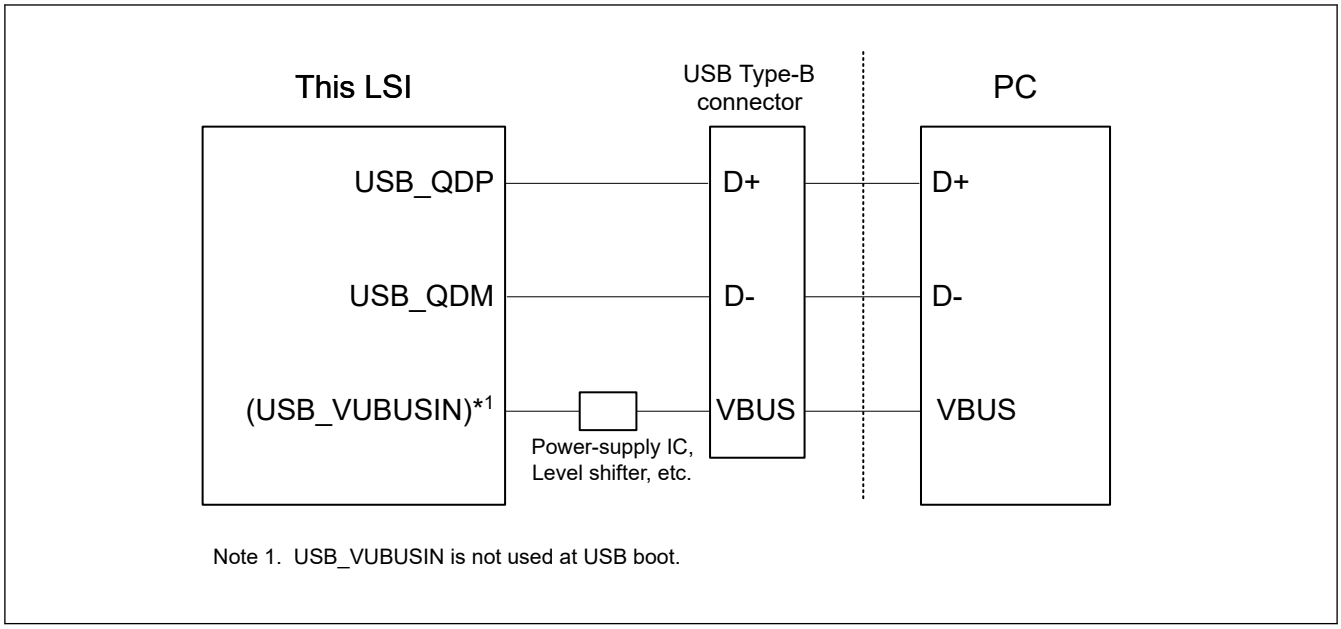

Figure 4.12 Connection diagram of this LSI with a PC (USB)

4.6.8.1 Operation Setting in USB Boot Mode

After the reset is released, if the boot processing starts in USB boot mode, the following setting values are used:

- CPU clock (CPU0CLK): 500 MHz
- USB mode: High speed, function mode
- USB function: USB Communication Device Class (CDC)

Note: After USB cable is connected with the LSI, USB cable should not be disconnected until the loader program is executed.

4.6.8.2 Boot Procedure

This boot procedure assumes using terminal emulator.

Table 4.16 USB boot procedure

Steps	What to do
1	After power-on-reset is released, LSI initialization and USB enumeration are performed on USB boot mode. Then, the LSI waits to receive "OPEN" data of Motorola S-record format, S0 record type, from the PC.
2	PC will receive "USB Download mode (Normal USB boot)" message.
3	The LSI waits to receive "HDR NM" data of Motorola S-record format, S0 record type, from the PC.
4	After received the data, the LSI will send out the following message to the PC. "--- Load Program to RAM ----------"
5	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC. The received data will be changed to binary data and forwarded to internal memory.
6	When USB boot program receives destination address by Motorola S-record format, S7 record type, that is a notification from the PC to terminate the transfer.
7	The LSI will send out the following message to the PC. "--- Start Boot Program on RAM ----------"
8	An end process is executed and the loader program is transferred to BTCM or SYSRAM.

Note: See section 4.6.9. Motorola S-record Format for SCI/USB Boot about S-record format.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- USB communication error
- Receive Motorola S-record format except S0, S3, and S7 record

- Check sum error of S-record format
- Addressing: Outside of BTCM or SYSRAM area
- Loader program size: Outside of BTCM or SYSRAM capacity

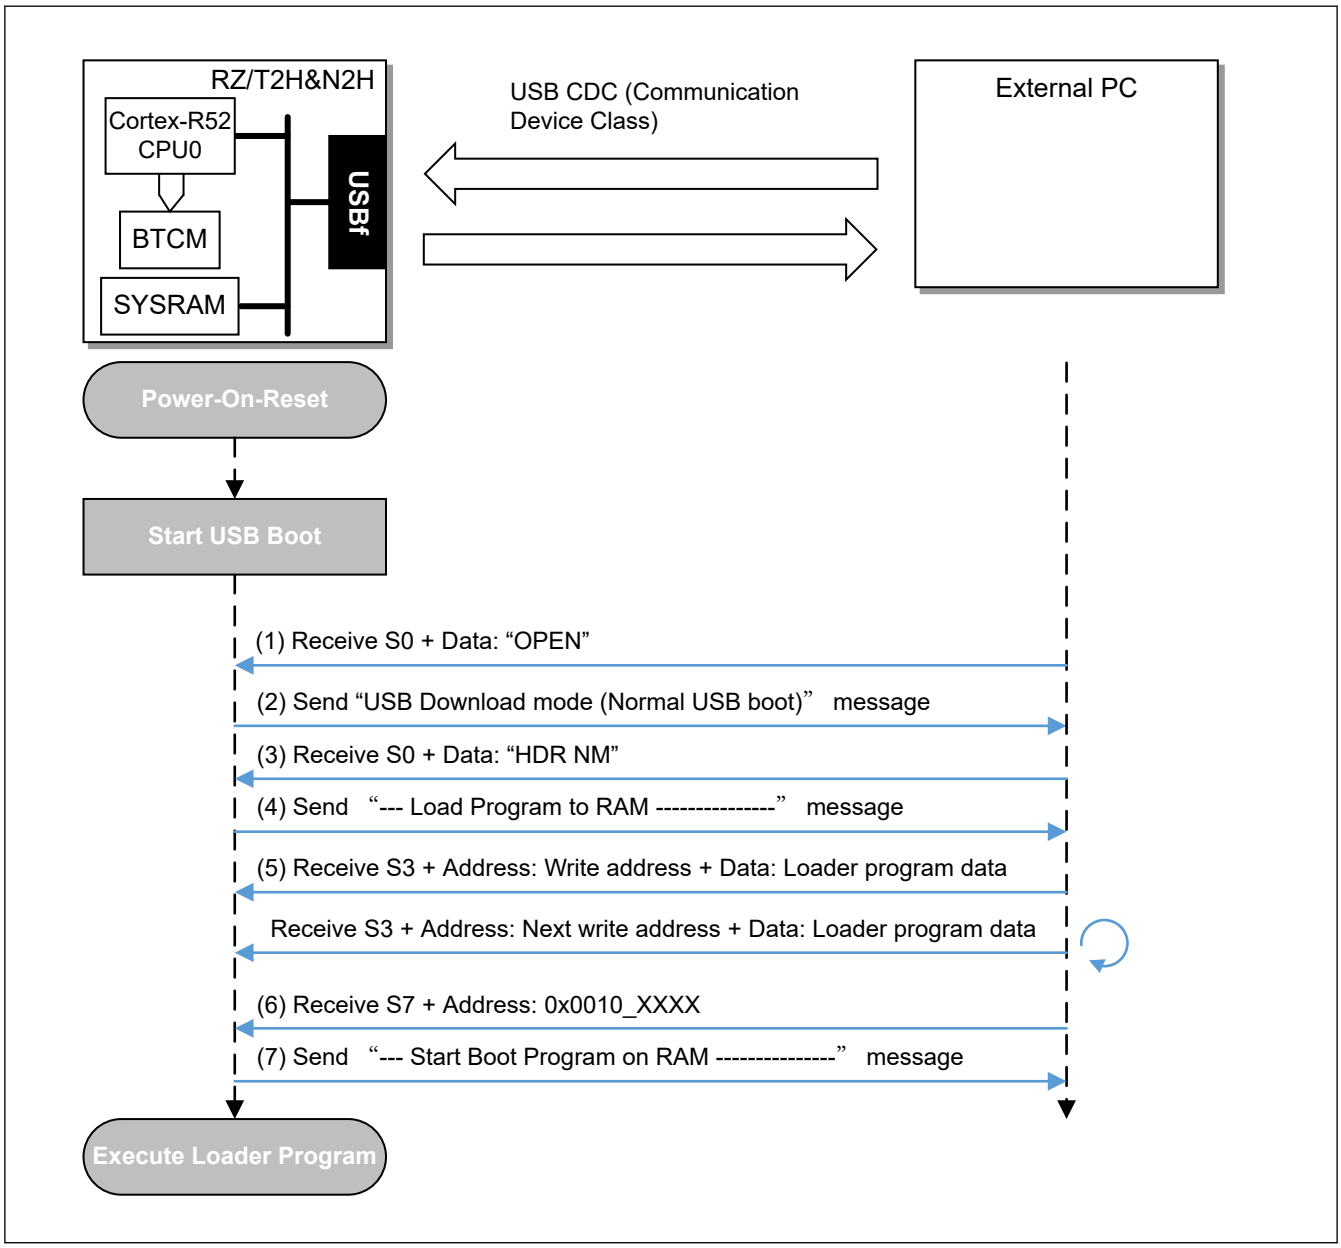

Figure 4.13 USB boot sequence

4.6.9 Motorola S-record Format for SCI/USB Boot

SCI/USB boot uses S0, S3, and S7 record type only. The record field is shown in Figure 4.14.

S-record Format

S-Type	Byte Count	Address	Data	Check sum
S0	2 byte	2 byte	2 byte × n (n = 1, 2, ⋯)	2 byte

S-Type	Byte Count	Address	Data	Check sum
S3	2 byte	4 byte	2 byte × n (n = 1, 2, ⋯)	2 byte

S-Type	Byte Count	Address	Check sum
S7	2 byte	4 byte	2 byte

Figure 4.14 S-record format for SCI/USB boot

4.6.10 SCI/USB Authentication

SCI/USB authentication mechanism checks access permission for SCI (UART) boot mode and USB boot mode.

In order to enable connection, a pass result of the authentication mechanism is required if authentication is required.

Authentication level is selectable from 3 states by setting SCI/USB Boot Authentication Mode area (AUTHMODES) in OTP:

- No authentication
- Authentication
- Permanent prohibition

When authentication is selected, 128-bit authentication ID must be written to SCI/USB Boot Authentication Plaintext ID area (SIDP) in OTP in advance.

If authentication is selected, this LSI requests to input 128-bit authentication ID from SCI/USB at the beginning of the boot. If authentication fails, then no connection is permitted and boot fails. RES# pin reset is required to retry boot.

If permanent prohibition is selected, this LSI prohibits connection by SCI/USB boot mode permanently and boot fails.

Note: In non-security support product, SCI/USB authentication is performed by plaintext comparison. It is the simple method but also known that it is comparatively weak from the sniffing point of view. It is recommended to use plaintext authentication in the limited area only where the risk of sniffing is low. In general, it is strongly recommended to use security support product which provides more secure authentication.

4.6.11 SCI Authentication Boot Procedure with Plaintext ID

This boot procedure assumes using terminal emulator. This authentication is supported for non-security product.

Table 4.17 SCI authentication boot procedure with plaintext ID (1 of 2)

Steps	What to do
1	PC will receive "SCI Download mode (SCI authentication boot (plaintext))" message after power-on-reset is released and LSI initialization is done on SCI boot mode.
2	The LSI waits to receive "HDR PL" data of Motorola S-record format, S0 record type, from the PC.

Table 4.17 SCI authentication boot procedure with plaintext ID (2 of 2)

Steps	What to do
3	The LSI waits to receive 16-byte password, authentication ID, filled in data area of Motorola S-record format, S0 record type, from the PC. Until SCI boot program receive this record type, the LSI discards other record types.
4	The SCI boot program forwards the password to a register and verifies password against authentication ID which is set into OTP. If the password check passed, SCI boot program starts to receive a loader program. If failed, an error code is returned and the boot program is aborted.
5	The LSI will send out the following message to the PC. "--- Load Program to RAM ----------"
6	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC, and the received data will be changed to binary data, forward to internal memory.
7	When SCI boot program receives Motorola S-record format, S7 record type, that notice to terminate from the PC.
8	The LSI will send out the following message to the PC. "--- Start Boot Program on RAM ----------"
9	Executes an end process and the loader program transferred into BTCM.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- SCI communication error
- Receive Motorola S-record format except S0, S3 and S7 record
- Check sum error of S-record format
- Addressing: Outside of BTCM or SYSRAM area
- Loader program size: Outside of BTCM or SYSRAM capacity
- Authentication is failed

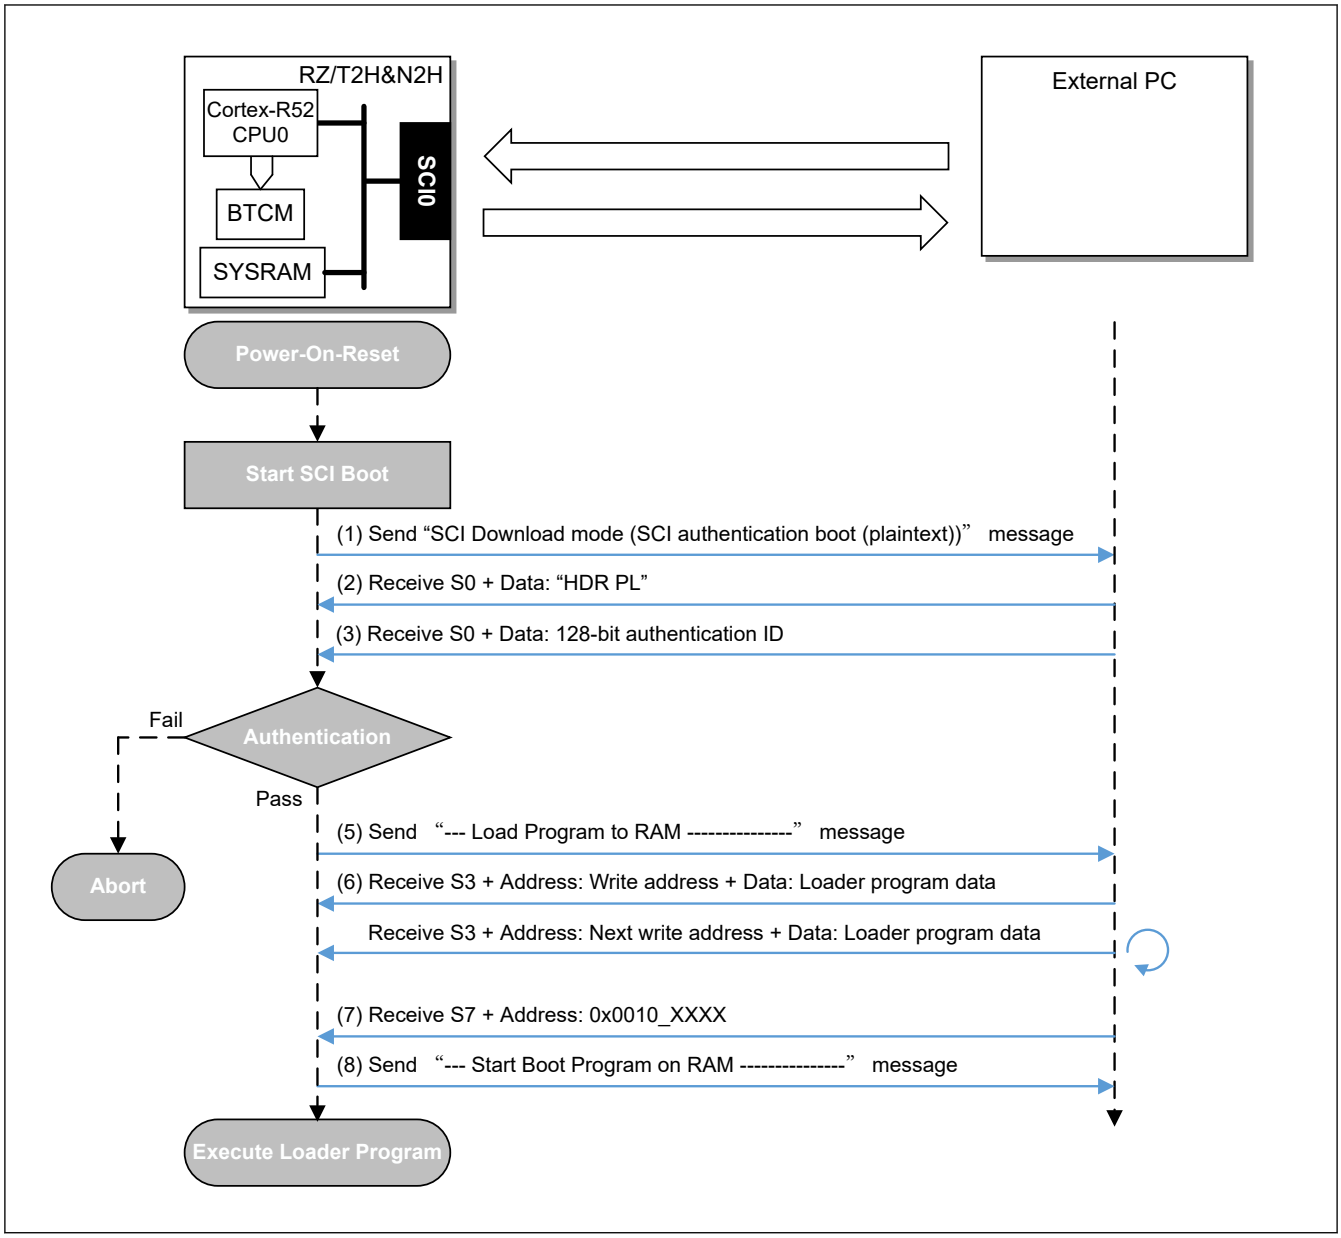

Figure 4.15 SCI authentication boot (plaintext) sequence

4.6.12 USB Authentication Boot Procedure with Plaintext ID

This boot procedure assumes using terminal emulator. This authentication is supported for non-security product.

Table 4.18 USB authentication boot procedure with plaintext ID (1 of 2)

Steps	What to do
1	After power-on-reset is released, LSI initialization and USB enumeration are performed on USB boot mode. Then, the LSI waits to receive "OPEN" data of Motorola S-record format, S0 record type, from the PC.
2	PC will receive "USB Download mode (USB authentication boot (plaintext))" message.
3	The LSI waits to receive "HDR PL" data of Motorola S-record format, S0 record type, from the PC.
4	The LSI waits to receive 16-byte password, authentication ID, filled in data area of Motorola S-record format, S0 record type, from the PC. Until USB boot program receive this record type, the LSI discards other record types.

Table 4.18 USB authentication boot procedure with plaintext ID (2 of 2)

Steps	What to do
5	The USB boot program forwards the password to a register and verifies password against authentication ID which is set into OTP. If the password check passed, USB boot program starts to receive a loader program. If failed, an error code is returned and the boot program is aborted.
6	The LSI will send out the following message to the PC. "--- Load Program to RAM ----------"
7	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC, and the received data will be changed to binary data, forward to internal memory.
8	When USB boot program receives Motorola S-record format, S7 record type, that notice to terminate from the PC.
9	The LSI will send out the following message to the PC. "--- Start Boot Program on RAM ----------"
10	Executes an end process and the loader program transferred into BTCM.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- USB communication error
- Receive Motorola S-record format except S0, S3 and S7 record
- Check sum error of S-record format
- Addressing: Outside of BTCM or SYSRAM area
- Loader program size: Outside of BTCM or SYSRAM capacity
- Authentication is failed

4.6.13 Usage Note

4.6.13.1 Separated I/O domain

The LSI supports 1.8 V or 3.3 V operation voltage of separated I/O domains for Ethernet interface, xSPI, and SDHI.

Table 4.19 shows the list of separated I/O domain. Since voltage tolerance of I/O buffer is automatically controlled by detecting the applied voltage (1.8 V or 3.3 V) to VDD1833_n, indication of applied voltage by external pin is not needed. However, applied voltage of the I/O domain used as boot peripheral must be indicated by MDV pin so that boot ROM can optimize drivability of I/O buffer according to the information.

Table 4.19 List of separated I/O domain

No. of I/O domain	Power supply pin	Feature	Note
0	VDD1833_0	Ethernet port 0 (ETH0_xxx)	Applied voltage depends on type of interface each port. • RGMII: 1.8 V only • MII/RMII: 3.3 V only
1	VDD1833_1	Ethernet port 1 (ETH1_xxx)	
2	VDD1833_2	Ethernet port 2 (ETH2_xxx)	
3	VDD1833_3	Ethernet port 3 (ETH3_xxx)	
4	VDD1833_4	xSPI unit 0 (XSPI0_xxx)	Applied voltage is selectable from 1.8 V or 3.3 V at power-on each unit.
5	VDD1833_5	xSPI unit 1 (XSPI1_xxx)	
6	VDD1833_6	SDHI unit 0 (SD0_xxx[*1]) SD or eMMC interface support	Applied voltage is selectable from 1.8 V or 3.3 V at power-on in case of eMMC interface. Change of applied voltage is supported according to the operating mode in case of SD interface.
7	VDD1833_7	SDHI unit 1 (SD1_xxx[*1]) SD interface support	Change of applied voltage is supported according to the operating mode.

Note 1. Except SDn_CD, SDn_WP, SDn_PWEN, SDn_IOVS (n = 0, 1). I/O voltage of these pins are fixed to 3.3 V.

4.6.13.2 Reset after eSD Boot

The eSD boot assumes start from 3.3 V operation. When system is reset after changing operating IO voltage from 3.3 V to 1.8 V, perform power cycle (1.8V → Off → 3.3 V) at the reset to initialize the SD device.

5. Address Space

5.1 Address Space

This LSI has a 32-GB address space ranging from 0x0_0000_0000 to 0x7_FFFF_FFFF (35-bit address) for Cortex-A55, PCIE, and CoreSight, and a 4-GB address space ranging from 0x0000_0000 to 0xFFFF_FFFF (32-bit address) for Cortex-R52 and other masters. Figure 5.1, Figure 5.2, and Figure 5.3 show the memory maps of the bus masters. Accessible areas will differ depending on the operating mode and the states of control bits.

In over 4-GB address space, PCIE and DDR areas are available. 32-bit address master can access to these areas via mirror area. Mirror area can be set from any 256 MB for PCIE area and 512 MB for DDR area each bus master. 64-bit address master can access to these areas via over 4-GB address space. In addition, except CoreSight ETR, 64-bit address master can also access to these areas via mirror area in 32-bit address space. For details, see section 13.4.5. Address Expander. Note that upper 3-bit may be omitted for the register address up to 4-GB in this manual.

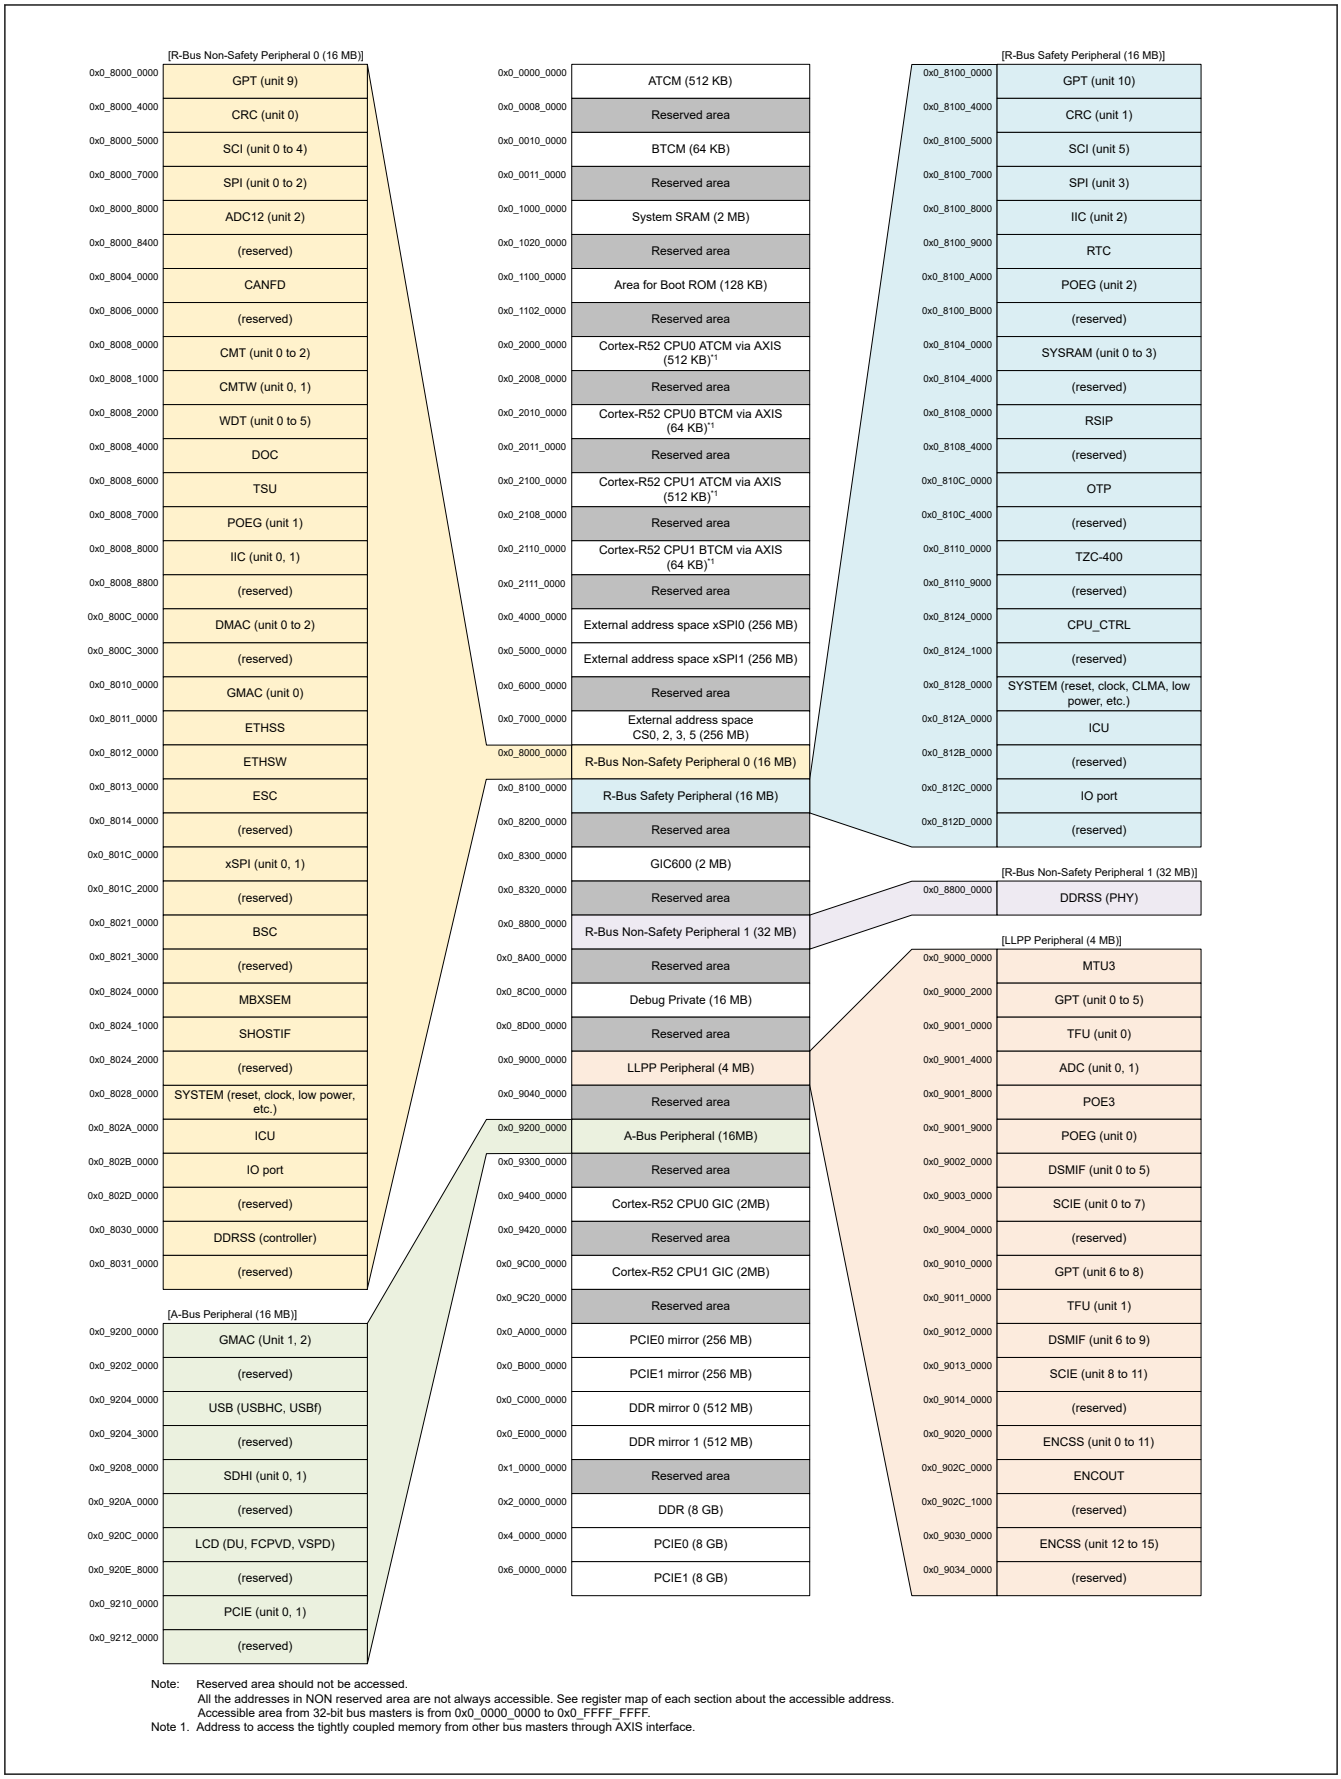

Figure 5.1 Unified memory map

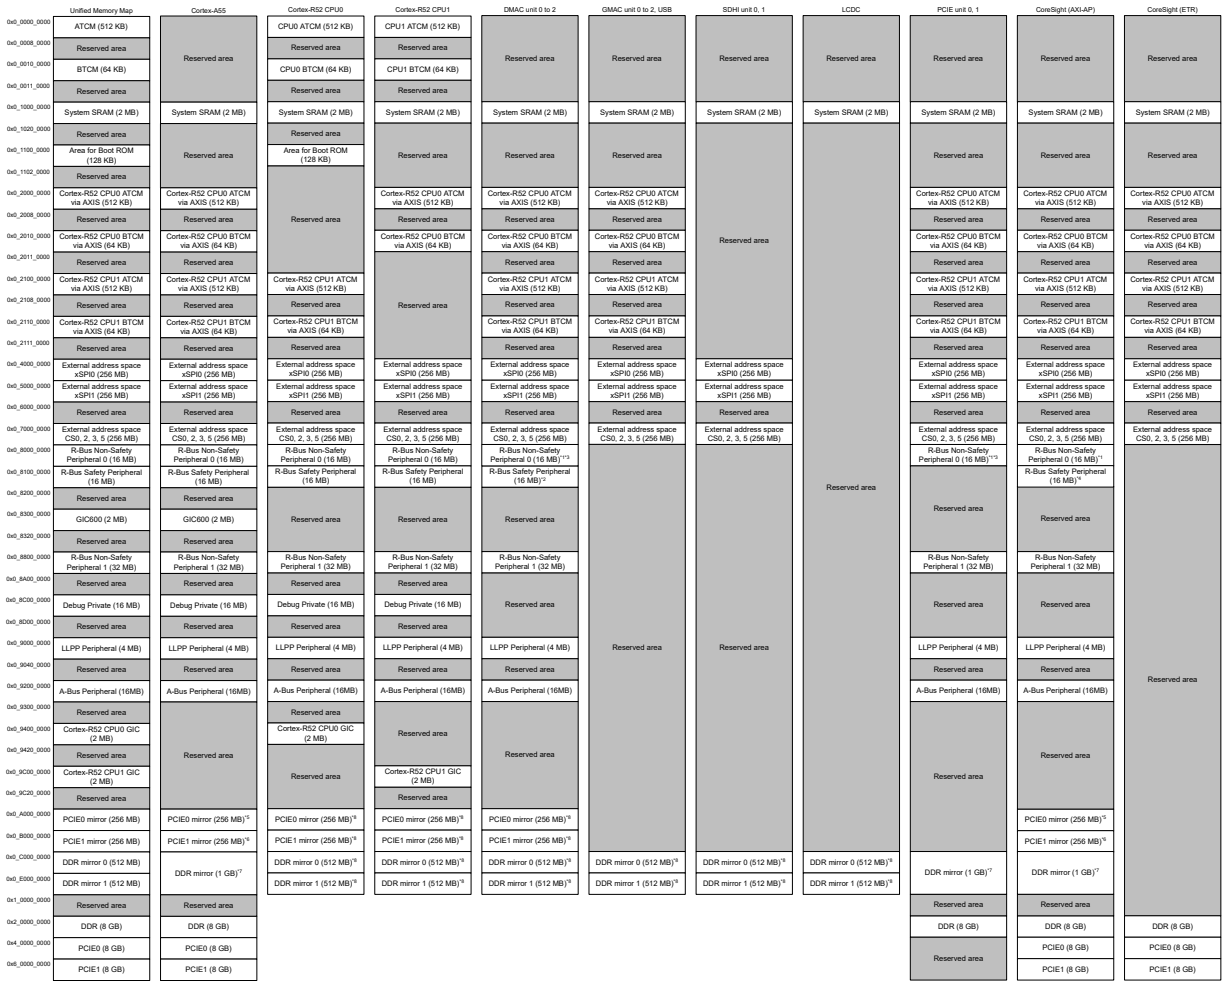

Note 1. A part of IO port (0x802B000 to 0x802BFFFF) is not accessible.
Note 2. RSIP register only.
Note 3. DMAC, xSPI, BSC, MBXSEM, SHOSTIF, SYSTEM, ICU, DDRSS registers are not accessible.
Note 4. SYSTEM and TZC400 registers only.
Note 5. Mirror of 0x4_0000_0000 to 0x4_0FFF_FFFF
Note 6. Mirror of 0x6_0000_0000 to 0x6_0FFF_FFFF
Note 7. Mirror of 0x2_0000_0000 to 0x2_3FFF_FFFF
Note 8. Mirror area is configurable. For details, see section 13.4.5. Address Expander.

Figure 5.2 Memory map each bus master

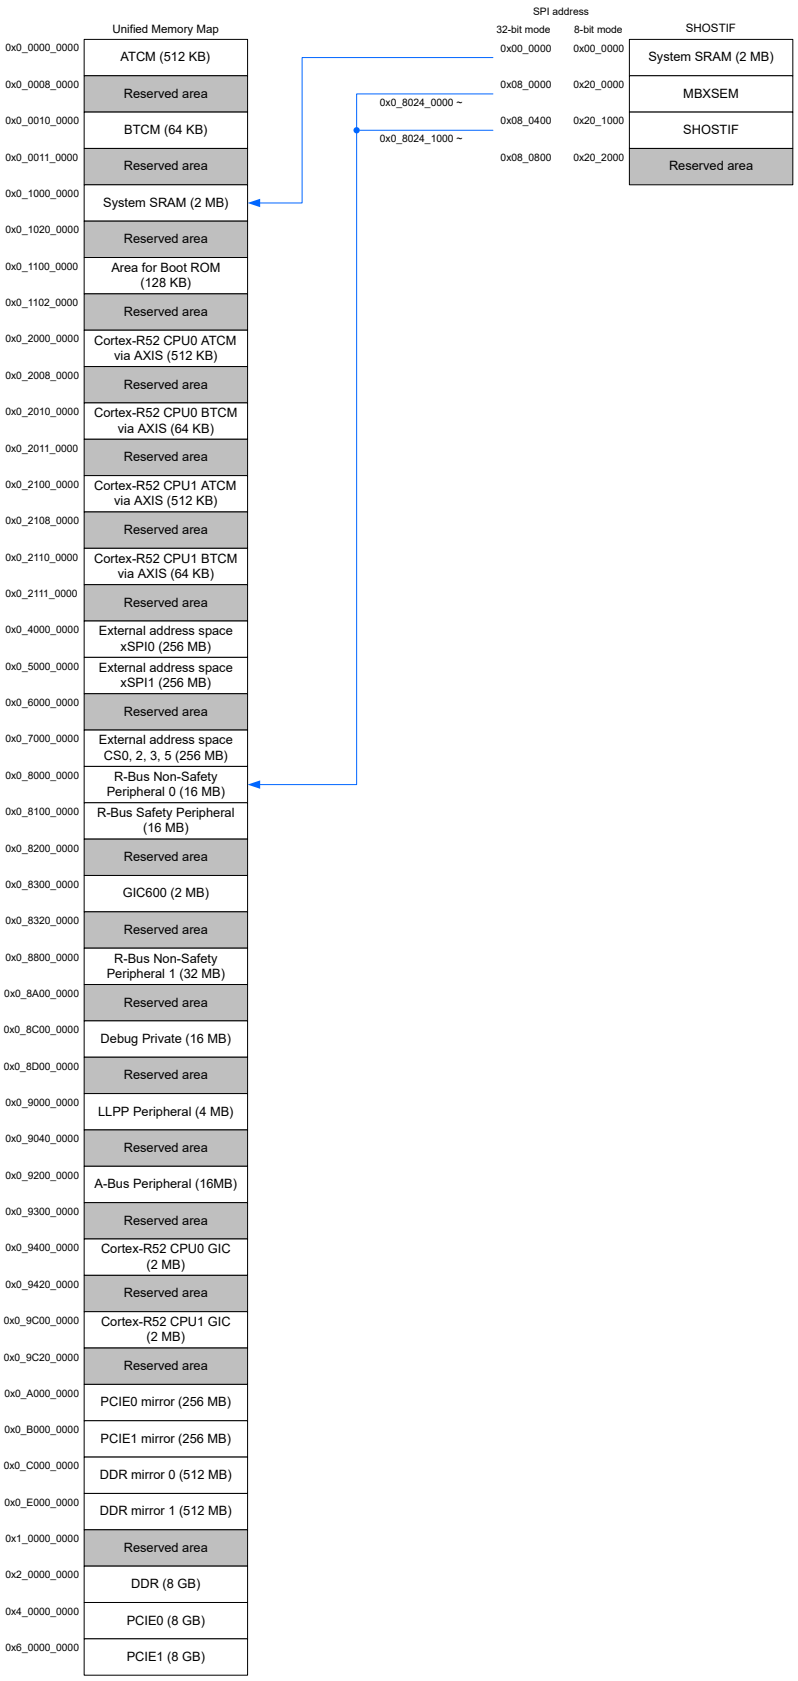

Figure 5.3 Memory map for external host interface

6. Reset

6.1 Overview

Available reset types are RES# pin reset, system software reset, Cortex-A55 Cluster, Core0/1/2/3 software reset, Cortex-R52 CPU0/1 software reset, and error reset. Table 6.1 lists the reset names and sources.

Table 6.1 Reset names and sources

Reset name	Source
RES# pin reset	The low level is applied to the RES# pin
System software reset	SWRSYS register setting
Cortex-A55 Cluster software reset	SWR55C register setting
Cortex-A55 Core0 software reset	SWR550 register setting (release only once after power-on)
Cortex-A55 Core1 software reset	SWR551 register setting (release only once after power-on)
Cortex-A55 Core2 software reset	SWR552 register setting (release only once after power-on)
Cortex-A55 Core3 software reset	SWR553 register setting (release only once after power-on)
Cortex-R52 CPU0 software reset	SWRCPU0 register setting
Cortex-R52 CPU1 software reset	SWRCPU1 register setting
Error reset	Reset request from the ICU

The internal states and pins are initialized by reset.

Table 6.2 lists the reset targets to be initialized for each reset type. For details on reset control during debugging, see section 10.3.3. Reset Configuration and the Method of Connecting with the Emulator.

Table 6.2 Targets to be initialized for each reset type (✓: to be initialized, —: no change) (1 of 2)

Reset target		Reset source										
		RES# pin reset (cold)	RES# pin reset (warm)	System software reset	Cortex-A55 cluster software reset	Cortex-A55 Core0 software reset	Cortex-A55 Core1 software reset	Cortex-A55 Core2 software reset	Cortex-A55 Core3 software reset	Cortex-R52 CPU0 software reset	Cortex-R52 CPU1 software reset	Error reset

RSTOUT# pin output		✓ (low)*3	✓ (low)*3	✓ (low)*3	—	—	—	—	—	—	—	✓ (low)*3

Note 1. An operating mode is selected according to the input level of the mode setting pin (MD2, MD1, and MD0) when the pin reset state (RES# and TRST# pins are both low) is released. For details on the operating mode, see section 4.2. Types and Selection of Operating Modes.

Note 2. The operating mode is not initialized in response to this type of reset and the LSI is in the operating mode that was selected following the previous release from the reset state applied by the low level on the RES#. For details, see section 4, Operating Modes.

Note 3. For the low output period, see section 6.4.9. Reset Output Pin (RSTOUT#).

Table 6.3 lists the input and output pins related to the reset.

Table 6.3 Input and output pins related to reset

Pin name	I/O	Function
RES#	Input	Reset pin. Use this pin to reset the entire LSI except the debugging circuit and the TAP (Test Access Port). Since the power-on reset circuit is not incorporated in this LSI, a reset circuit must be implemented outside this LSI. For an example of configuration of the external reset circuit, see section 10.3.3. Reset Configuration and the Method of Connecting with the Emulator.
TRST#	Input	Test reset pin. Use this pin to reset the TAP. If you design a board which enables an emulator, set the TRST# pin to low level during the same period as the RES# pin at the time of power-on. The TRST# pin should also be controllable independently. When unused, this pin must be set to low level or connected to the same signal as the RES# pin. For details, see section 10.3.3. Reset Configuration and the Method of Connecting with the Emulator.
RSTOUT#	Output	Reset output pin. This pin outputs low-level signal on occurrence of a reset. For details, see section 6.4.9. Reset Output Pin (RSTOUT#). This pin can be used for resetting the external device.

Note: For details on resetting the debugging circuit, see section 10, Debugging Interface.

6.2 Register Map

Table 6.4 Reset register map

Address	Register symbol	Resister name	Write protection
0x8028_0200	RSTSR0	Reset Status Register 0	PRCRN.PRC1

6.3 Register Descriptions

The registers related to the clock generation circuit can be write-protected. To write to the registers, specify bit 1 of the Protect Register (PRCRN and PRCRS) to cancel the write protection. For details, see section 11, Register Write Protection Function.

6.3.1 RSTSR0 : Reset Status Register 0

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x200

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SWR553	SWR552	SWR551	SWR550	SWR55C	SWR1F	SWR0F	SWRSF	ERRF	TRF	—
Value after reset:	0	0	0	0	0	x*1	x*1	x*1	x*1	x*1	x*1	x*1	x*1	x*1	x*1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	TRF	RES# Pin Reset Detect Flag This bit indicates the detection of RES# pin reset. 0: RES# pin reset not detected 1: RES# pin reset detected	R/W*2
2	ERRF	Error Reset Detect Flag This bit indicates the detection of error reset. 0: Error reset not detected 1: Error reset detected	R/W*2
3	SWRSF	System Software Reset Detect Flag This bit indicates the detection of system software reset. 0: System software reset not detected 1: System software reset detected	R/W*2
4	SWR0F	Cortex-R52 CPU0 Software Reset Detect Flag This bit indicates the detection of Cortex-R52 CPU0 software reset. 0: Cortex-R52 CPU0 software reset not detected 1: Cortex-R52 CPU0 software reset detected	R/W*2
5	SWR1F	Cortex-R52 CPU1 Software Reset Detect Flag This bit indicates the detection of Cortex-R52 CPU1 software reset. 0: Cortex-R52 CPU1 software reset not detected 1: Cortex-R52 CPU1 software reset detected	R/W*2
6	SWR55C	Cortex-A55 Cluster Software Reset Detect Flag This bit indicates the detection of Cortex-A55 Cluster software reset. 0: Cortex-A55 Cluster software reset no detected 1: Cortex-A55 Cluster software reset detected	R/W*2
7	SWR550	Cortex-A55 Core0 Software Reset Detect Flag This bit indicates the detection of Cortex-A55 Core0 software reset. 0: Cortex-A55 Core0 software reset no detected 1: Cortex-A55 Core0 software reset detected	R/W*2
8	SWR551	Cortex-A55 Core1 Software Reset Detect Flag This bit indicates the detection of Cortex-A55 Core1 software reset. 0: Cortex-A55 Core1 software reset no detected 1: Cortex-A55 Core1 software reset detected	R/W*2
9	SWR552	Cortex-A55 Core2 Software Reset Detect Flag This bit indicates the detection of Cortex-A55 Core2 software reset. 0: Cortex-A55 Core2 software reset no detected 1: Cortex-A55 Core2 software reset detected	R/W*2
10	SWR553	Cortex-A55 Core3 Software Reset Detect Flag This bit indicates the detection of Cortex-A55 Core3 software reset. 0: Cortex-A55 Core3 software reset no detected 1: Cortex-A55 Core3 software reset detected	R/W*2
31:11	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value after reset depends on the reset source. The following table lists the sources for the setting (1) and clearing (0) of each bit.

Bit	Setting conditions (0 to 1)	Clearing conditions (1 to 0)
TRF	When the low level is input to the RES# pin.	• When system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
ERRF	When an error predefined as a reset source by ICU setting occurs	• When the low level is input to the RES# pin or system software reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWRSF	When system software reset occurs	• When the low level is input to the RES# pin or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR0F	When Cortex-R52 CPU0 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR1F	When Cortex-R52 CPU1 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR55C	When Cortex-A55 Cluster software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR550	When Cortex-A55 Core0 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR551	When Cortex-A55 Core1 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR552	When Cortex-A55 Core2 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR553	When Cortex-A55 Core3 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read

Note 2. Only 0 can be written to clear the flag.

The RSTSR0 register specifies reset generation sources.

6.3.2 SWRSYS : System Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x210

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	System Software Reset 1. When 0x4321A501 is written, a system software reset occurs. After about 93 µs (Typ.) from the reset occurrence, it automatically releases the reset, starts the system in the selected boot mode in the operating mode pins, and the program is restarted. 2. Other than the above written value, nothing is changed.	W

The SWRSYS register controls system software reset.

6.3.3 SWRCPU0 : Cortex-R52 CPU0 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x220

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-R52 CPU0 Software Reset 1. When 0x4321A501 is written, Cortex-R52 CPU0 software reset occurs. Cortex-R52 CPU0 and WDTR0 for Cortex-R52 CPU0 are in reset state. Reset is not released automatically. Write 0x00000000 to release the reset. 2. When 0x4321A502 is written, Cortex-R52 CPU0 software reset occurs. Cortex-R52 CPU0 and WDTR0 for Cortex-R52 CPU0 are in reset state. After around 1.02 µs passes from reset occurrence, reset is released automatically. Prohibit to write 0x00000000 to this register before above time passes. 3. Other than the above written value, nothing is changed. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released. Be careful that after writing 0x4321A501 or 0x4321A502 to this register, transfer Cortex-R52 CPU0 to WFI state manually. After confirming Cortex-R52 CPU0 is in WFI state by hardware, Cortex-R52 CPU0 and WDTR0 for Cortex-R52 CPU0 are reset. It is prohibited to write 0x4321A501 after writing 0x4321A502 and 0x4321A502 after writing 0x4321A501.	R/W

The SWRCPU0 register controls the Cortex-R52 CPU0 software reset.

6.3.4 SWRCPU1 : Cortex-R52 CPU1 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x224

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-R52 CPU1 Software Reset 1. When 0x4321A501 is written, Cortex-R52 CPU1 software reset occurs. Cortex-R52 CPU1 and WDTR1 for Cortex-R52 CPU1 are in reset state. Reset is not released automatically. Write 0x00000000 to release the reset. 2. When 0x4321A502 is written, Cortex-R52 CPU1 software reset occurs. Cortex-R52 CPU1 and WDTR1 for Cortex-R52 CPU1 are in reset state. After around 1.02 µs passes from reset occurrence, reset is released automatically. Prohibit to write 0x00000000 to this register before above time passes. 3. Other than the above written value, nothing is changed. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released. Be careful that after writing 0x4321A501 or 0x4321A502 to this register, transfer Cortex-R52 CPU1 to WFI state manually. After confirming Cortex-R52 CPU1 is in WFI state, Cortex-R52 CPU1 and WDTR1 for Cortex-R52 CPU1 are reset. It is prohibited to write 0x4321A501 after writing 0x4321A502 and 0x4321A502 after writing 0x4321A501.	R/W

The SWRCPU1 register controls Cortex-R52 CPU1 software reset.

6.3.5 SWR55C : Cortex-A55 Cluster Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x228

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-A55 Cluster Software Reset 1. When 0x4321A501 is written, Cortex-A55 Cluster software reset occurs. Cortex-A55 Cluster and WDTA3-0 for Cortex-A55 are in reset state. Reset is not released automatically. Write 0x00000000 to release the reset. 2. When 0x4321A502 is written, Cortex-A55 Cluster software reset occurs. Cortex-A55 Cluster and WDTA3-0 for Cortex-A55 are in reset state. After around 1.02 µs passes from reset occurrence, reset is released automatically. Prohibit to write 0x00000000 to this register before above time passes. 3. Other than the above written value, nothing is changed. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released. Be careful that after writing 0x4321A501 or 0x4321A502 to this register, transfer Cortex-A55 Cluster to WFI state manually. After confirming Cortex-A55 Cluster is in WFI state by hardware, Cortex-A55 Cluster and WDTA3-0 for Cortex-A55 are reset. It is prohibited to write 0x4321A501 after writing 0x4321A502 and 0x4321A502 after writing 0x4321A501.	R/W

The SWR55C register controls the Cortex-A55 Cluster software reset.

6.3.6 SWR550 : Cortex-A55 Core0 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x22C

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-A55 Core0 Software Reset When reset is released after power-on, write 0x00000000. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released.	R/W

The SWR550 register controls the Cortex-A55 Core0 software reset after power-on.

6.3.7 SWR551 : Cortex-A55 Core1 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x230

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-A55 Core1 Software Reset When reset is released after power-on, write 0x00000000. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released.	R/W

The SWR551 register controls the Cortex-A55 Core1 software reset after power-on.

6.3.8 SWR552 : Cortex-A55 Core2 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x234

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-A55 Core2 Software Reset When reset is released after power-on, write 0x00000000. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released.	R/W

The SWR552 register controls the Cortex-A55 Core2 software reset after power-on.

6.3.9 SWR553 : Cortex-A55 Core3 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x238

Bit position:	31																												0
Bit field:	SWR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	Cortex-A55 Core3 Software Reset When reset is released after power-on, write 0x00000000. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released.	R/W

The SWR553 register controls the Cortex-A55 Core3 software reset after power-on.

6.3.10 SWR55ARC : Cortex-A55 Software Reset Automatic Release Control Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x23C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	ARC553	ARC552	ARC551	ARC550
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	ARC550	Select automatic reset release for Cortex-A55 Core0 when Cortex-A55 Cluster software reset occurs with automatic reset release. 0: Reset is not released. 1: Reset is released automatically.	R/W

Bit	Symbol	Function	R/W
1	ARC551	Select automatic reset release for Cortex-A55 Core1 when Cortex-A55 Cluster software reset occurs with automatic reset release. 0: Reset is not released. 1: Reset is released automatically.	R/W
2	ARC552	Select automatic reset release for Cortex-A55 Core2 when Cortex-A55 Cluster software reset occurs with automatic reset release. 0: Reset is not released. 1: Reset is released automatically.	R/W
3	ARC553	Select automatic reset release for Cortex-A55 Core3 when Cortex-A55 Cluster software reset occurs with automatic reset release. 0: Reset is not released. 1: Reset is released automatically.	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The SWR55ARC register determines which Cortex-A55 Cores are released from reset state automatically when Cortex-A55 Cluster software reset occurs with automatic reset release.

6.3.11 MRCTLA : Module Reset Control Register A

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x240

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	MRCTLA05	MRCTLA04	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	MRCTLA04	xSPI Unit 0 Reset Control This bit controls the reset of the xSPI unit 0. 0: xSPI Unit 0 is released from reset 1: xSPI Unit 0 is in the reset state	R/W
5	MRCTLA05	xSPI Unit 1 Reset Control This bit controls the reset of xSPI unit 1. 0: xSPI Unit 1 is released from reset 1: xSPI Unit 1 is in the reset state	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLA register controls the reset of xSPI. This register is available in Non Safety region.

6.3.12 MRCTLE : Module Reset Control Register E

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x250

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MRCTLE19	MRCTLE18	MRCTLE17	MRCTLE16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	MRCTLE06	MRCTLE05	MRCTLE04	MRCTLE03	MRCTLE02	MRCTLE01	MRCTLE00
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MRCTLE00	GMAC Unit 0 (PCLKH clock domain) Reset Control This bit controls the reset of GMAC Unit 0 (PCLKH clock domain). 0: GMAC Unit 0 (PCLKH clock domain) is released from reset 1: GMAC Unit 0 (PCLKH clock domain) is in the reset state	R/W
1	MRCTLE01	GMAC Unit 0 (PCLKM clock domain) Reset Control This bit controls the reset of GMAC Unit 0 (PCLKM clock domain). 0: GMAC Unit 0 (PCLKM clock domain) is released from reset 1: GMAC Unit 0 (PCLKM clock domain) is in the reset state	R/W
2	MRCTLE02	ETHSW Reset Control This bit controls the reset of ETHSW. 0: ETHSW is released from reset 1: ETHSW is in the reset state	R/W
3	MRCTLE03	ESC (Bus clock domain) Reset Control This bit controls the reset of ESC (Bus clock domain). 0: ESC (Bus clock domain) is released from reset 1: ESC (Bus clock domain) is in the reset state	R/W
4	MRCTLE04	ESC (IP clock domain) Reset Control This bit controls the reset of ESC (IP clock domain). 0: ESC (IP clock domain) is released from reset 1: ESC (IP clock domain) is in the reset state	R/W
5	MRCTLE05	Ethernet Subsystem Register Reset Control This bit controls the reset of Ethernet Subsystem register. 0: Ethernet Subsystem register is released from reset 1: Ethernet Subsystem register is in the reset state	R/W
6	MRCTLE06	MII Converter Reset Control This bit controls the reset of MII converter. 0: MII converter is released from reset 1: MII converter is in the reset state	R/W
15:7	—	These bits are read as 0. The write value should be 0.	R/W
16	MRCTLE16	GMAC Unit 1 (PCLKAH clock domain) Reset Control This bit controls the reset of GMAC Unit 1 (PCLKAH clock domain). 0: GMAC Unit 1 (PCLKAH clock domain) is released from reset 1: GMAC Unit 1 (PCLKAH clock domain) is in the reset state	R/W
17	MRCTLE17	GMAC Unit 1 (PCLKAM clock domain) Reset Control This bit controls the reset of GMAC Unit 1 (PCLKAM clock domain). 0: GMAC Unit 1 (PCLKAM clock domain) is released from reset 1: GMAC Unit 1 (PCLKAM clock domain) is in the reset state	R/W
18	MRCTLE18	GMAC Unit 2 (PCLKAH clock domain) Reset Control This bit controls the reset of GMAC Unit 2 (PCLKAH clock domain). 0: GMAC Unit 1 (PCLKAH clock domain) is released from reset 1: GMAC Unit 1 (PCLKAH clock domain) is in the reset state	R/W

Bit	Symbol	Function	R/W
19	MRCTLE19	GMAC Unit 2 (PCLKAM clock domain) Reset Control This bit controls the reset of GMAC Unit 2 (PCLKAM clock domain). 0: GMAC Unit 2 (PCLKAM clock domain) is released from reset 1: GMAC Unit 2 (PCLKAM clock domain) is in the reset state	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLE register controls the reset of peripheral modules related to Ethernet.

6.3.13 MRCTLI : Module Reset Control Register I

Base address: SYSC_S = 0x8128_0000

Offset address: 0x260

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MRCTLI03	MRCTLI02	MRCTLI01	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	MRCTLI01	SHOSTIF (Master bus clock domain) Reset Control 0: SHOSTIF (Master bus clock domain) is released from reset 1: SHOSTIF (Master bus clock domain) is in the reset state	R/W
2	MRCTLI02	SHOSTIF (Slave bus clock domain) Reset Control 0: SHOSTIF (Slave bus clock domain) is released from reset 1: SHOSTIF (Slave bus clock domain) is in the reset state	R/W
3	MRCTLI03	SHOSTIF (IP clock domain) Reset Control 0: SHOSTIF (IP clock domain) is released from reset 1: SHOSTIF (IP clock domain) is in the reset state	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLI register controls reset of SHOSTIF. This register is available in Safety region.

6.3.14 MRCTLM : Module Reset Control Register M

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x270

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	MRCTLM25	MRCTLM24	MRCTLM23	MRCTLM22	MRCTLM21	MRCTLM20	MRCTLM19	MRCTLM18	MRCTLM17	MRCTLM16
Value after reset:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MRCTLM8	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	MRCTLM8	PCIE Reset Control 0: PCIE is released from reset 1: PCIE is in the reset state	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	MRCTLM16	DDRSS (rst_n) Reset Control 0: DDRSS (rst_n) is released from reset 1: DDRSS (rst_n) is in the reset state	R/W
17	MRCTLM17	DDRSS (PwrOkIn) Reset Control 0: DDRSS (PwrOkIn) is released from reset 1: DDRSS (PwrOkIn) is in the reset state	R/W
18	MRCTLM18	DDRSS (Reset) Reset Control 0: DDRSS (Reset) is released from reset 1: DDRSS (Reset) is in the reset state	R/W
19	MRCTLM19	DDRSS (axi0_ARESETn) Reset Control 0: DDRSS (axi0_ARESETn) is released from reset 1: DDRSS (axi0_ARESETn) is in the reset state	R/W
20	MRCTLM20	DDRSS (axi1_ARESETn) Reset Control 0: DDRSS (axi1_ARESETn) is released from reset 1: DDRSS (axi1_ARESETn) is in the reset state	R/W
21	MRCTLM21	DDRSS (axi2_ARESETn) Reset Control 0: DDRSS (axi2_ARESETn) is released from reset 1: DDRSS (axi2_ARESETn) is in the reset state	R/W
22	MRCTLM22	DDRSS (axi3_ARESETn) Reset Control 0: DDRSS (axi3_ARESETn) is released from reset 1: DDRSS (axi3_ARESETn) is in the reset state	R/W
23	MRCTLM23	DDRSS (axi4_ARESETn) Reset Control 0: DDRSS (axi4_ARESETn) is released from reset 1: DDRSS (axi4_ARESETn) is in the reset state	R/W
24	MRCTLM24	DDRSS (MC_PRESETn) Reset Control 0: DDRSS (MC_PRESETn) is released from reset 1: DDRSS (MC_PRESETn) is in the reset state	R/W
25	MRCTLM25	DDRSS (PHY_PRESETn) Reset Control 0: DDRSS (PHY_PRESETn) is released from reset 1: DDRSS (PHY_PRESETn) is in the reset state	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLM register controls reset of PCIE and DDRSS. This register is available in Non-Safety region. Set MRCTLM[25:16] bits for DDRSS Reset Control to the same value.

6.4 Operation

6.4.1 RES# Pin Reset

This reset occurs when a signal arrives at the RES# pin from the externally connected reset circuit. When the signal becomes low at the RES# pin, all on-going processes are aborted and the LSI enters the reset state. To successfully reset the LSI, the RES# pin should be held at the low level for the specified time after power-on. For details on the reset configuration, see section 10.3.3. Reset Configuration and the Method of Connecting with the Emulator.

After the reset is released, Cortex-R52 CPU0 starts boot processing. When a RES# pin reset occurs, the RSTSR0.TRF flag is set to 1.

6.4.2 System Software Reset

System software reset occurs when 0x4321A501 is written to the SWRSYS register. When system software reset occurs, all on-going processes are aborted and the LSI enters the reset state. After the reset is released, CPU0 starts boot processing.

When system software reset occurs, the RSTSR0.SWRSF flag is set to 1.

6.4.3 Cortex-R52 CPU0/1 Software Reset

These software reset apply to target CPU core and its related WDT. It occurs when 0x4321A501 or 0x4321A502 is written to the target CPU's software reset register and target CPU core is transferred to WFI state by WFI instruction. Do not write the same software reset register again until target CPU core is transferred to WFI state and the software reset register is changed to 0x00000001.

When 0x4321A501 is written, reset is not released automatically. To release the reset state of target CPU core software reset, write 0x00000000 to the software reset register from other CPU after confirming the read value of the software reset register is 0x00000001.

When 0x4321A502 is written, reset is released automatically. Do not write 0x00000000 to the software reset register.

When Cortex-R52 CPU0/1 software reset occurs, corresponding flag in RSTSR0 register is set to 1.

6.4.4 Cortex-A55 Core0/1/2/3 Software Reset

These software reset apply to target CPU core and its related WDT.

SWR55n register is only used to release Cortes-A55 Core n from the reset state after power-on. Reset of the Cortex-A55 Core n and its related WDT are released when 0x00000000 is written to the SWR55n register.

To reset the Cortex-A55 Core n and release it from the reset state again automatically, set the RR bit in the RMR_EL3 register in target Cortex-A55 Core n and transfer the core to WFI state by WFI instruction.

It is not supported to remain the reset state again once reset is released after power-on.

6.4.5 Cortex-A55 Cluster Software Reset

Cortex-A55 Cluster software reset applies to Cortex-A55 Cluster and all WDT for Cortex-A55. It occurs when 0x4321A501 or 0x4321A502 is written to the SWR55C register and all the Cortex-A55 Cores are transferred to WFI state by WFI instruction. Do not write the SWR55C register again until all the Cortex-A55 Cores are transferred to WFI state and SWR55C register is changed to 0x00000001.

When 0x4321A501 is written, reset is not released automatically. To release the reset state of each Cortex-A55 Core software reset, write 0x00000000 to the corresponding software reset register from non-reset CPU after confirming the read value of SWR55C is 0x00000001.

When 0x4321A502 is written, reset is released automatically for the cores which are specified in the SWR55ARC register. Do not write 0x00000000 to the SWR55C register.

When Cortex-A55 Cluster software reset occurs, the RSTSR0.SWR55C flag is set to 1.

6.4.6 Error Reset

This reset is generated in response to a reset request from ICU. ICU receives critical errors, such as oscillation stop detection, from individual modules in the LSI, and generates reset requests corresponding to respective errors. For details on the ICU operation, see section 12, Interrupt Controller (ICU).

When error reset occurs, all on-going processes are aborted and the LSI enters the reset state. After the reset is released, Cortex-R52 CPU0 starts boot processing. When the error reset occurs, the RSTSR0.ERRF flag is set to 1.

6.4.7 Reset Release from RES# Pin Reset, System Software Reset or Error Reset

When a RES# pin reset, system software reset, or error reset occurs, CPU cores other than Cortex-R52 CPU0 is in reset state initially in case the second boot CPU is Cortex-R52 CPU0, and CPU cores other than Cortex-A55 Core0 is in reset state initially in case the second boot CPU is Cortex-A55 Core0.

To release the reset state, write 0x00000000 to the target CPU's software reset register from non-reset CPU.

Note that some other settings like vector table setting and storing the code are needed before releasing reset. See section 2, Cortex-A55 and section 3, Cortex-R52.

6.4.8 Determination of Reset Generation Source

Reading the RSTSR0 register determines which reset source was used for reset execution. Figure 6.1 shows an example of the flow to identify a reset generation source.

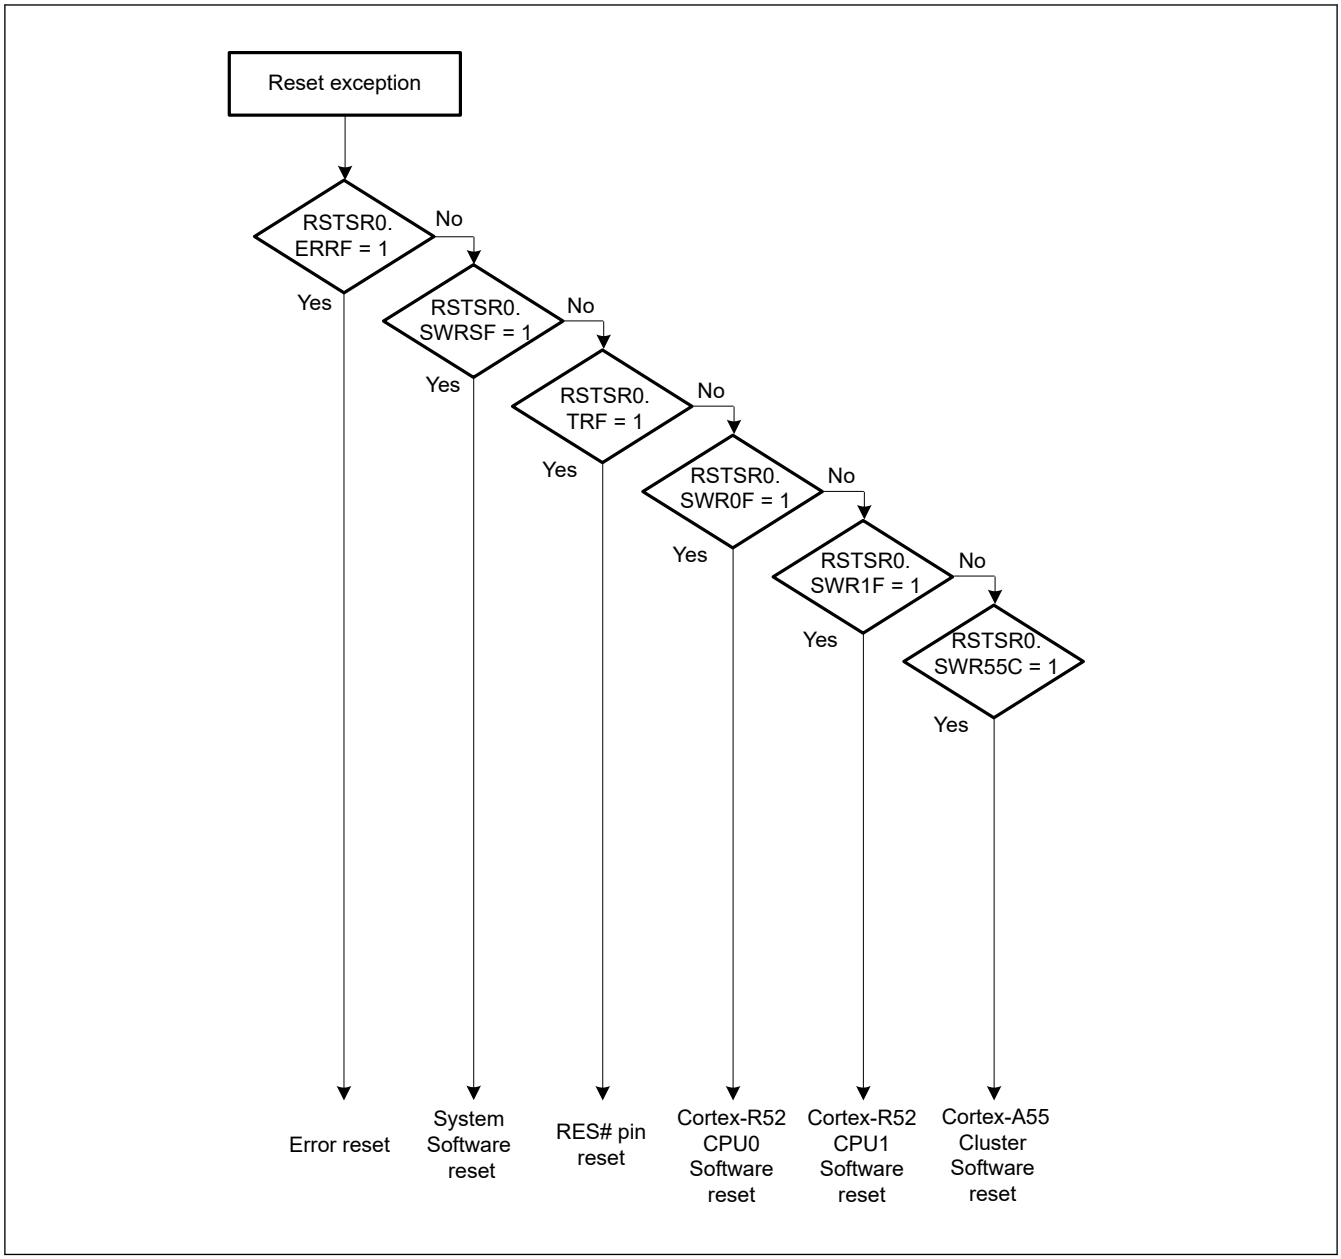

Figure 6.1 Example flow to identify a reset generation source

6.4.9 Reset Output Pin (RSTOUT#)

The reset output pin (RSTOUT#) outputs the low level on occurrence of a reset when the input level of the RES# pin is low. It also outputs the low level on occurrence of a system software reset or an error reset. If the RES# pin remains low for a specified time period and then changes to high, the reset output remains low for 450 µs (Typ.) and then changes to high. Similarly, the reset output remains low for 450 µs (Typ.) following a system software reset or an error reset, and then changes to high.

6.4.10 Noise Cancellation for Reset Input

Noise cancellation using analog delay is applied to the RES# and TRST# pins. This can eliminate noises within 100 ns (Min.).

6.5 Usage Note

6.5.1 Notes on Module Reset Control Register Operation

1. To secure processing after release from a module reset, dummy read the same register at least seven times except RTC and LCDC after writing to initiate release from the module reset, and only then proceed with the subsequent processing. For RTC, dummy read the same register at least 300 times and for LCDC, at least 100 times.
2. When module is reset once and released again, make sure that the target bit of module reset control register is set to 1 by reading the register before releasing from a module reset. Then release from a module reset.
3. When controlling the module resetting of modules that can initiate DMA transfer or that otherwise have operations related to those of other blocks, confirm that DMA transfer initiated by such modules and other points of interlinked operation has been completed before releasing modules from or placing modules in the module reset state. For set products in which such target modules are not used, design of the control of the module reset is on the assumption that the modules are initially stopped. Therefore, the absence of unexpected operations in states other than the above is not guaranteed. For example, operation after releasing modules from or placing modules in the module reset state while a module is running is not guaranteed.
4. In case of AXI-type slave module, the access to the slave I/F needs to be stopped by slave stop function before changing module reset state. For details, see section 13.4.3. Slave Stop Function.

6.5.2 Connection of Reset Output Pin (RSTOUT#)

The low level is output for a specified period of time on RSTOUT# after deassertion of the signal on the RES# pin. This means that RSTOUT# should not be directly connected as a reset signal for a flash memory to be used in booting the LSI. Otherwise, release of the LSI itself from the reset state may precede that for the flash memory.

However, using RSTOUT# as the reset signal for external device is still possible as long as the timing requirement imposed by the output on the RSTOUT# pin is satisfied.

RSTOUT# is shared function for port P08_5 but it is set by default after RES# pin reset, system software reset, and error reset. Even if function other than RSTOUT# is assigned, low level output from RSTOUT# is always effective when RES# pin reset, system software reset, or error reset occurs.

For details, see section 6.4.9. Reset Output Pin (RSTOUT#).

7. Clock Generation Circuit

7.1 Overview

The LSI incorporates a Clock Generation Circuit (CGC).

Table 7.1 and Table 7.2 show the specifications of the clock generation circuit. Figure 7.1 shows the block diagram and Table 7.3 shows the pin configuration of the clock generation circuit.

Table 7.1 Specifications of Clock Generation Circuit (1 of 2)

Item	Description
Main clock oscillator	Resonator frequency: 25 MHz
	External clock input frequency: 25 MHz
	Connectable resonator or additional circuit: Ceramic resonator, crystal resonator (XTALSEL = 1) Connection pin: EXTAL, XTAL
	External clock input instead of resonator (XTALSEL = 0) Connection pin: EXTCLKIN
	Oscillation stop detection function: When the CLMA6 detects an abnormality in oscillation of the main clock, the system clock source is switched to LOCO and PLL output clocks are switched to LOCO or free-running clock of PLL, and MTU3 and GPT pins are placed in the high-impedance state.
PLL0 circuit (for Cortex-A55 CPU clock)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 48 multiplication
	Output clock frequency of the PLL0 circuit: 1200 MHz
	SSC (Spread Spectrum Clock) / Non-SSC selectable
	Oscillation abnormality detection function: When the CLMA0 detects an abnormality in oscillation of the PLL0 with MOSC, the PLL0 output clock is switched to MOSC, and MTU3 and GPT pins are placed in the high-impedance state.
PLL1 circuit (for Cortex-R52 CPU, main bus R and peripheral clock)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 40 multiplication
	Output clock frequency of the PLL1 circuit: 1000 MHz
	Non-SSC fixed
	Oscillation abnormality detection function: When the CLMA1 detects an abnormality in oscillation of the PLL1 with MOSC, the PLL1 output clock is switched to MOSC, and MTU3 and GPT pins are placed in the high-impedance state.
PLL2 circuit (for DDRSS and SDHI clock)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 32 multiplication
	Output clock frequency of the PLL2 circuit: 800 MHz
	SSC/Non-SSC selectable
	Oscillation abnormality detection function: When the CLMA2 detects an abnormality in oscillation of the PLL2 with MOSC, the PLL2 output clock is switched to MOSC.
PLL3 circuit (for LCDC clock)	Input clock source: Dividing clock (1/50) of PLL4
	Input frequency: 48 MHz
	Frequency multiplication ratio: Configurable
	Output clock frequency of the PLL3 circuit: 25 MHz to 430 MHz
	Non-SSC fixed
	Oscillation abnormality detection function: When the CLMA3 detects an abnormality in oscillation of the PLL3 with MOSC, the PLL3 output clock is switched to MOSC.

Table 7.1 Specifications of Clock Generation Circuit (2 of 2)

Item	Description
PLL4 circuit (for main bus A and peripheral clock)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 96 multiplication
	Output clock frequency of the PLL4 circuit: 2400 MHz
	Non-SSC fixed
	Oscillation abnormality detection function: When the CLMA4 detects an abnormality in oscillation of the PLL4 with MOSC, the PLL4 output clock is switched to MOSC, and MTU3 and GPT pins are placed in the high-impedance state.
Low-speed on-chip oscillator (LOCO)	Oscillation frequency: 1 MHz +/- 20%
	Oscillation abnormality detection function: The CLMA2 can detect an abnormality in oscillation of the LOCO.
External clock input for JTAG (TCK)	Input frequency: 50 MHz (max.)

Table 7.2 Specifications of Clock Generation Circuit (internal clock) (1 of 3)

Item	Clock source	Supplied to	Frequency	Reset value
Cortex-A55 Core0 clock (CA55C0CLK)	Dividing clock of PLL0 (1/1 or 1/2)	Cortex-A55 Core0	600, 1200 MHz	600 MHz
Cortex-A55 Core1 clock (CA55C1CLK)	Dividing clock of PLL0 (1/1 or 1/2)	Cortex-A55 Core1	600, 1200 MHz	600 MHz
Cortex-A55 Core2 clock (CA55C2CLK)	Dividing clock of PLL0 (1/1 or 1/2)	Cortex-A55 Core2	600, 1200 MHz	600 MHz
Cortex-A55 Core3 clock (CA55C3CLK)	Dividing clock of PLL0 (1/1 or 1/2)	Cortex-A55 Core3	600, 1200 MHz	600 MHz
Cortex-A55 DSU clock (CA55SCLK)	Dividing clock of PLL1 (1/1 or 1/2)	Cortex-A55 DSU	500, 1000 MHz	500 MHz
Cortex-R52 CPU0 clock (CR52C0CLK)	Dividing clock of PLL1 (1/1 or 1/2)	Cortex-R52 CPU0	500, 1000 MHz	500 MHz
Cortex-R52 CPU1 clock (CR52C1CLK)	Dividing clock of PLL1 (1/1 or 1/2)	Cortex-R52 CPU1	500, 1000 MHz	500 MHz
Peripheral module clock AH (PCLKAH)	Dividing clock of PLL4 (1/6)	Main bus A, PCIE, LCDC (clk_a), GMAC unit 1, 2 (ACLK), DDRSS (A0, A1, A4)	400 MHz	400 MHz
Peripheral module clock AM (PCLKAM)	Dividing clock of PLL4 (1/12)	USB, GMAC unit 1, 2 (HCLK), SDHI (ACLK, IMCLK)	200 MHz (PCLKAH/2)	200 MHz
Peripheral module clock AL (PCLKAL)	Dividing clock of PLL4 (1/24)	LCDC (clk_p)	100 MHz (PCLKAH/4)	100 MHz
SDHI clock (SDHI_clkhs)	PLL2 clock	SDHI (clk_hs)	800 MHz	800 MHz
DDR controller DFI clock (DFICLK)	PLL2 clock	DDRSS	800 MHz	800 MHz
LCDC clock (LCDC_clkd)	Dividing clock of PLL3 (1/2, 1/4, 1/6, 1/8, 1/10, 1/12, 1/14, 1/16, 1/18, 1/20, 1/22, 1/24, 1/26, 1/28, 1/30, 1/32)	LCDC (clk_d)	5 MHz to 100 MHz	12.5 MHz
Peripheral module clock H (PCLKH)	Dividing clock of PLL1 (1/4)	Main bus R, SYSRAM, LLPP, Peripheral module (MTU3, GPT (LLPP, bus), TFU, DSMIF (bus), POE3, POEG(LLPP), ADC12 unit 0, 1 (bus)), xSPI (bus), DMAC, MPU, GMAC unit 0 (ACLK), SHOSTIF (pclk, mhclk), ELC, RSIP, DDRSS (R2, R3), MBXSEM	250 MHz	250 MHz

Table 7.2 Specifications of Clock Generation Circuit (internal clock) (2 of 3)

Item	Clock source	Supplied to	Frequency	Reset value
Peripheral module clock M (PCLKM)	Dividing clock of PLL1 (1/8)	Peripheral module (CRC, SCI (bus), SPI (bus), GPT (Non Safety, Safety), CANFD (bus)), ETHSW(bus), GMAC unit 0 (HCLK), OTP, Ethernet SS Reg, GPIO, CLMA, ADC12 unit 2 (bus), ICU	125 MHz (PCLKH/2)	125 MHz
Peripheral module clock L (PCLKL)	Dividing clock of PLL1 (1/16)	Peripheral module (POEG (Non Safety, Safety), IIC, DOC,CMT, CMTW, WDT, RTC, TSU), ADC12 (conversion), DDRSS (PHY_reg)	62.5 MHz (PCLKH/4)	62.5 MHz
Peripheral module clock for GPT in LLPP (PCLKGPTL)	Dividing clock of PLL1 (1/2)	GPT (LLPP, operation)	500 MHz (PCLKH × 2)	500 MHz
Peripheral module clock for DSMIF (PCLKDSMIFn)	Dividing clock of PLL4 (1/6) and PLL1 (1/4)	DSMIF (core)	250 MHz (PCLKH), 400 MHz (Asynchronous)	250 MHz
Peripheral module clock for SCI/SCIE (PCLKSCIn/ PCLKSCIEm) (n = 0 to 5, m = 0 to 11)	Dividing clock of PLL4 (1/24, 1/25, 1/30, 1/32) and PLL1 (1/8)	SCIn/SCIEm (operation)	75, 80, 96, 100 MHz (Asynchronous), 125 MHz (PCLKM)	75 MHz
Peripheral module clock for SPI (PCLKSPIn) (n = 0 to 3)	Dividing clock of PLL4 (1/24, 1/25, 1/30, 1/32) and PLL1 (1/8)	SPIn (operation)	75, 80, 96, 100 MHz (Asynchronous), 125 MHz (PCLKM)	75 MHz
Peripheral module clock for CANFD (PCLKCAN)	Dividing clock of PLL4 (1/30, 1/60)	CANFD (serial)	40, 80 MHz	40 MHz
Peripheral module clock for SHOSTIF (PCLKSHOST)	Dividing clock of PLL4 (1/6)	SHOSTIF (ssi_clk)	400 MHz	400 MHz
External bus clock (BSC_CLK, CKIO)	Dividing clock of PLL1 (1/8, 1/12, 1/16, 1/20, 1/24, 1/28, 1/32)	External bus	125, 83.3, 62.5, 50, 41.7, 35.7, 31.25 MHz*1	50 MHz
Peripheral module clock for RTC (PCLKRTC)	Dividing clock of MOSC (1/128)	RTC (operation)	195.3 kHz	195.3 kHz
USB clock (USB_CLK)	Dividing clock of PLL4 (1/48)	USB	50 MHz	50 MHz
xSPIn serial clock (XSPI_CLKn) (n = 0, 1)	Dividing clock of PLL4 (1/18, 1/24, 1/32, 1/48, 1/64, 1/96, 1/192)	xSPIn (operation)	133, 100, 75, 50, 37.5, 25, 12.5 MHz*2	12.5 MHz
Ethernet clock A (ETCLKA)	Dividing clock of PLL1 (1/5)	ETHSW	200 MHz	200 MHz
Ethernet clock B (ETCLKB)	Dividing clock of PLL1 (1/8)	ETHSW, GMAC, RGMII/RMII Converter	125 MHz	125 MHz
Ethernet clock C (ETCLKC)	Dividing clock of PLL1 (1/10)	ESC	100 MHz	100 MHz
Ethernet clock D (ETCLKD)	Dividing clock of PLL1 (1/20)	RGMII/RMII Converter	50 MHz	50 MHz
Ethernet clock E (ETCLKE)	Dividing clock of PLL1 (1/40)	ESC, RGMII/RMII Converter	25 MHz	25 MHz
CLMAn sampling clock (CLMAMCLKA) (n = 0, 1, 2, 4)	Main clock oscillator divided by 2	CLMAn (n = 0, 1, 2, 4)	12.5 MHz	12.5 MHz
CLMA3 sampling clock (CLMAMCLKB)	Main clock oscillator divided by 16	CLMA3	1.56 MHz	1.56 MHz
CLMA5 sampling clock (CLMAMCLKC)	Main clock oscillator divided by 256	CLMA5	97.6 kHz	97.6 kHz

Table 7.2 Specifications of Clock Generation Circuit (internal clock) (3 of 3)

Item	Clock source	Supplied to	Frequency	Reset value
CLMA0 monitor clock (CLMAPLCLK0)	Dividing clock for PLL0 (1/16)	CLMA0	75 MHz	75 MHz
CLMA1 monitor clock (CLMAPLCLK1)	Dividing clock for PLL1 (1/16)	CLMA1	62.5 MHz	62.5 MHz
CLMA2 monitor clock (CLMAPLCLK2)	Dividing clock for PLL2 (1/16)	CLMA2	50 MHz	50 MHz
CLMA3 monitor clock (CLMAPLCLK3)	Dividing clock for PLL3 (1/4)	CLMA3	6.25 to 107.5 MHz	6.25 MHz
CLMA4 monitor clock (CLMAPLCLK4)	Dividing clock for PLL4 (1/32)	CLMA4	75 MHz	75 MHz
CLMA5 monitor clock (CLMALCLK)	LOCO output clock	CLMA5	1 MHz	1 MHz
CLMA6 monitor clock (CLMAMCLK)	Main clock oscillator divided by 2	CLMA6	12.5 MHz	12.5 MHz
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 50 MHz	—
Serial Host I/F clock (SHIFCLK)	HSPI_CK	SHOSTIF	Up to 40 MHz	—
EnDat Clock (PCLKENDAT)	Dividing clock of PLL4 (1/24)	ENDAT	100 MHz	100 MHz
BiSS-C Clock (PCLKBISS)	Dividing clock of PLL4 (1/30)	BISS	80 MHz	80 MHz
HIPERFACE DSL Clock (PCLKHDSL)	Dividing clock of PLL1 (1/32)	HDSL	75 MHz	75 MHz
A-format Clock (PCLKAFMT)	Dividing clock of PLL1 (1/30)	AFMT	80 MHz	80 MHz
ENCOUT clock (PCLKENCO)	Dividing clock of PLL1 (1/30, 1/120)	ENCOUT	20, 80 MHz	20 MHz
Ethernet PHY reference clock (ETHn_REFCLK) (n = 0 to 3)	Dividing clock of PLL1 (1/40), Main clock oscillator	— (External Ethernet PHY)	25 MHz	25 MHz
Ethernet PHY reference clock (RMIIn_REFCLK) (n = 0 to 3)	Dividing clock of PLL1 (1/20)	— (External Ethernet PHY)	50 MHz	50 MHz

Note 1. Max operating frequency depends on operating conditions (C, $T_j$min). For details, see section 58.5.3. Bus Timing.

Note 2. Max operating frequency depends on operating conditions (Voltage, SDR/DDR). For details, see section 58.5.5.12. xSPI Timing.

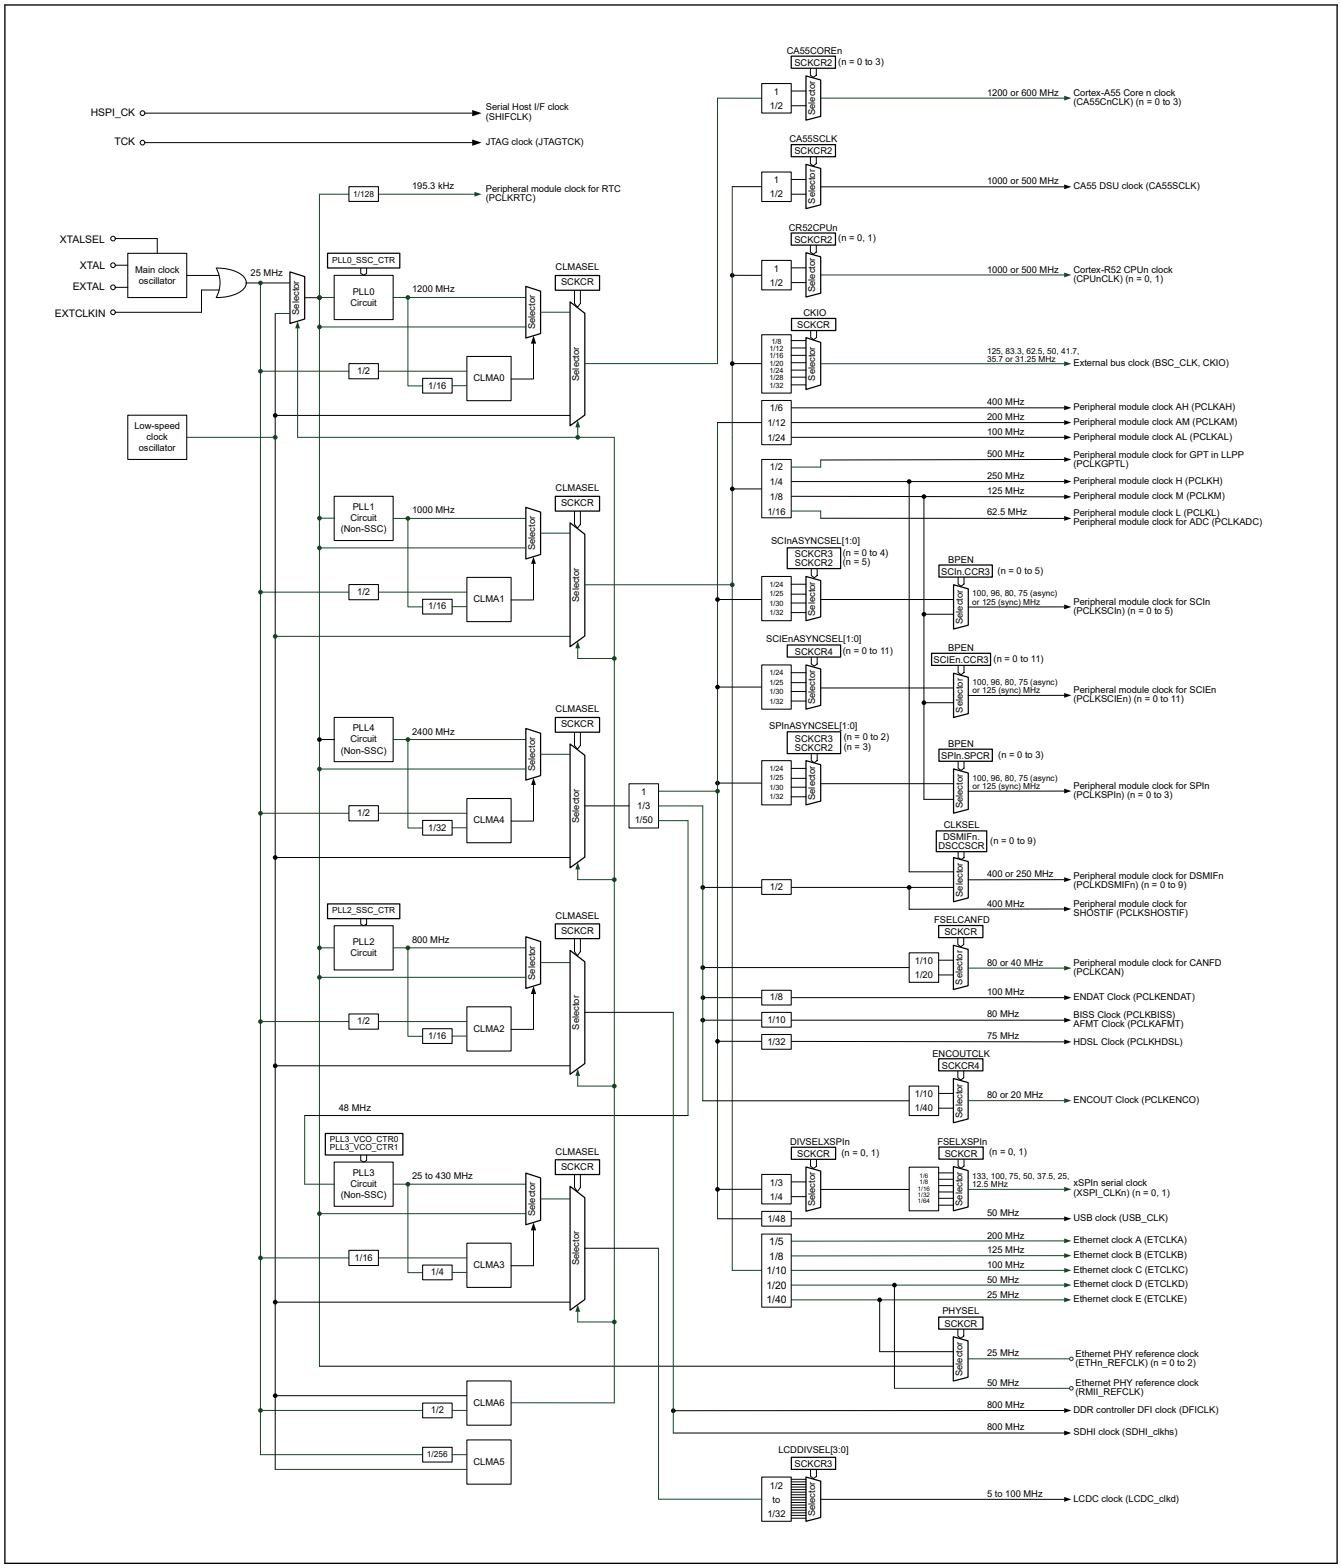

Figure 7.1 Block diagram of clock generation circuit

Table 7.3 Pin configuration of clock generation circuit (1 of 2)

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a crystal resonator. XTALSEL pin must be driven high. When using an external clock signal, EXTAL pin must be driven low. XTAL pin must never be driven or loaded by anything other than crystal resonator. For details, see section 7.4.2. External Clock Input.
EXTAL	Input	

Table 7.3 Pin configuration of clock generation circuit (2 of 2)

Pin name	I/O	Description
EXTCLKIN	Input	This pin is used to input an external clock signal. XTALSEL pin must be driven low. When using a crystal resonator, this pin must be driven low.
XTALSEL	Input	Main clock source select pin (low: EXTCLKIN, high: XTAL/EXTAL)
TCK	Input	This pin is used to input the clock for the JTAG.
CKIO	Output	This pin is used to supply the external bus clock (CKIO) to external devices.
ETH0_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
ETH1_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
ETH2_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
ETH3_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
RMII0_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.
RMII1_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.
RMII2_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.
RMII3_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.

Table 7.5 Clock Generation Circuit related system control register

Target	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
All the registers	—	—	SLVACCCTL8.SYSCTRL_SL

7.3 Register Descriptions

The registers related to the clock generation circuit can be write-protected. To write to the registers, specify bit 0 of the Protect Register (PRCRN and PRCRS) to cancel the write protection. For details, see section 11, Register Write Protection Function.

7.3.1 SCKCR : System Clock Control Register

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	CLMASEL	PHYSEL	FSELCAND	—	CKIO[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	0	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	DIVSELXSPI1	—	—	—	FSELXSPI1[2:0]			—	DIVSELXSPI0	—	—	—	FSELXSPI0[2:0]		
Value after reset:	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1	0

Bit	Symbol	Function	R/W
2:0	FSELXSPI0[2:0]	Set the frequency of the clock provided to xSPI Unit 0 in combination with bit 6 (DIVSELXSPI0). The combination is shown below. Both DIVSELXSPI0 and FSELXPI0 can be changed at the same time. Be careful that the set frequency is output after the intermediate frequency is output. Max operating frequency depends on operating conditions (Voltage, SDR/DDR). For details, see section 58.5.5.12. xSPI Timing.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	DIVSELXSPI0	Select the base clock to generate serial clock for xSPI Unit 0 0: 800 MHz 1: 600 MHz	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
10:8	FSELXSPI1[2:0]	Set the frequency of the clock provided to xSPI Unit 1 in combination with bit 14 (DIVSELXSPI1). Same as bits [2:0] for xSPI Unit 0.	R/W
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	DIVSELXSPI1	Select the base clock to generate serial clock for xSPI Unit 1 0: 800 MHz 1: 600 MHz	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

FSELXSPI0[2:0]	DIVSELXSPI0 = 0	DIVSELXSPI0 = 1
000b	Setting prohibited	
001b	Setting prohibited	
010b	133.3 MHz	Setting prohibited
011b	100.0 MHz	75.0 MHz
100b	50.0 MHz	37.5 MHz
101b	25.0 MHz	Setting prohibited
110b	12.5 MHz	Setting prohibited
111b	Setting prohibited	

Bit	Symbol	Function	R/W
18:16	CKIO[2:0]	Set the frequency of the external bus clock (CKIO) and the clock supplied to BSC. Max operating frequency depends on operating conditions (C, $T_j$min). For details, see section 58.5.3. Bus Timing. **CKIO[2:0] / Frequency** 000b: 125 MHz 001b: 83.3 MHz 010b: 62.5 MHz 011b: 50.0 MHz 100b: 41.7 MHz 101b: 35.7 MHz 110b: 31.25 MHz 111b: Setting prohibited	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W
20	FSELCANFD	Select the frequency of the clock supplied to CANFD 0: 80.0 MHz 1: 40.0 MHz	R/W
21	PHYSEL	Select the Ethernet PHY reference clock output (ETHn_REFCLK, n = 0 to 3) 0: PLL1 divider clock 1: Main clock oscillator	R/W
22	CLMASEL	Select alternative clock when main clock abnormal oscillation is detected in CLMA6 0: LOCO 1: PLL	R/W
31:23	—	These bits are read as 0. The write value should be 0.	R/W

The SCKCR register is used to select the frequency and source for each of the xSPI interface clock (XSPI_CLKn, n = 0, 1), external bus clock (CKIO), CANFD clock (PCLKCAN), Ethernet PHY reference clock (ETHn_REFCLK, n = 0 to 3), and alternative clock when the main clock abnormal oscillation is detected in CLMA6.

7.3.2 SCKCR2 : System Clock Control Register 2

Base address: SYSC_S = 0x8128_0000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	SCI5ASYNCSEL[1:0]		SPI3ASYNCSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CA55SCLK	CA55CORE3	CA55CORE2	CA55CORE1	CA55CORE0	—	—	—	—	CR52CPU1[1:0]		CR52CPU0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CR52CPU0[1:0]	Set the frequency of the clock provided to Coretex-R52 CPU0 0 0: 500.0 MHz 0 1: 1000.0 MHz 1 0: Setting prohibited 1 1: Setting prohibited	R/W

Bit	Symbol	Function	R/W
3:2	CR52CPU1[1:0]	Set the frequency of the clock provided to Coretex-R52 CPU1 0 0: 500.0 MHz 0 1: 1000.0 MHz 1 0: Setting prohibited 1 1: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	CA55CORE0	Set the frequency of the clock provided to Coretex-A55 Core0 0: 600.0 MHz 1: 1200.0 MHz	R/W
9	CA55CORE1	Set the frequency of the clock provided to Coretex-A55 Core1 0: 600.0 MHz 1: 1200.0 MHz	R/W
10	CA55CORE2	Set the frequency of the clock provided to Coretex-A55 Core2 0: 600.0 MHz 1: 1200.0 MHz	R/W
11	CA55CORE3	Set the frequency of the clock provided to Coretex-A55 Core3 0: 600.0 MHz 1: 1200.0 MHz	R/W
12	CA55SCLK	Set the frequency of the clock provided to Coretex-A55 DSU 0: 500.0 MHz 1: 1000.0 MHz	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
17:16	SPI3ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SPI3 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
19:18	SCI5ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI5 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The SCKCR2 register is used to select the frequency of the clock supplied to the Cortex-R52 CPU0 and CPU1, Cortex-A55 Core0 to Core3 and so on.

7.3.3 SCKCR3 : System Clock Control Register 3

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	LCDCDIVSEL[3:0]				—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SCI4ASYNCSEL[1:0]		SCI3ASYNCSEL[1:0]		SCI2ASYNCSEL[1:0]		SCI1ASYNCSEL[1:0]		SCI0ASYNCSEL[1:0]		SPI2ASYNCSEL[1:0]		SPI1ASYNCSEL[1:0]		SPI0ASYNCSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SPI0ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SPI0 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
3:2	SPI1ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SPI1 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
5:4	SPI2ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SPI2 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
7:6	SCI0ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI0 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
9:8	SCI1ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI1 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
11:10	SCI2ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI2 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
13:12	SCI3ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI3 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
15:14	SCI4ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCI4 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
19:16	—	These bits are read as 0. The write value should be 0.	R/W
23:20	LCDCDIVSEL[3:0]	Select the external divider of PLL3 output clock 0x0: 1/2 0x1: 1/4 0x2: 1/6 0x3: 1/8 0x4: 1/10 0x5: 1/12 0x6: 1/14 0x7: 1/16 0x8: 1/18 0x9: 1/20 0xA: 1/22 0xB: 1/24 0xC: 1/26 0xD: 1/28 0xE: 1/30 0xF: 1/32	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The SCKCR3 register is used to select the frequency of the clock supplied to the SPI and SCI, and external divider of the PLL3 output clock.

7.3.4 SCKCR4 : System Clock Control Register 4

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	ENCOUTCLK	SCIE11ASYNCSEL[1:0]		SCIE10ASYNCSEL[1:0]		SCIE9ASYNCSEL[1:0]		SCIE8ASYNCSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11:10	SCIE5ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE5 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
13:12	SCIE6ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE6 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
15:14	SCIE7ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE7 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W

Bit	Symbol	Function	R/W
17:16	SCIE8ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE8 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
19:18	SCIE9ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE9 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
21:20	SCIE10ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE10 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
23:22	SCIE11ASYNCSEL[1:0]	Select clock frequency when asynchronous serial clock is selected in SCIE11 0 0: 75.0 MHz 0 1: 80.0 MHz 1 0: 96.0 MHz 1 1: 100.0 MHz	R/W
24	ENCOUTCLK	Select the frequency of the clock provided to ENCOUT 0: 20.0 MHz 1: 80.0 MHz	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The SCKCR4 register is used to select the frequency of the clock supplied to the SCIE and ENCOUT.

7.3.5 PMSEL : PLL/Main OSC clock Select Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PMSEL4MON	PMSEL3MON	PMSEL2MON	PMSEL1MON	PMSEL0MON	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	—	These bits are read as 0. The write value should be 0.	R/W
9	PMSEL0MON	PLL0 domain clock source monitor 0: External clock 1: PLL0 output clock	R
10	PMSEL1MON	PLL1 domain clock source monitor 0: External clock 1: PLL1 output clock	R
11	PMSEL2MON	PLL2 domain clock source monitor 0: External clock 1: PLL2 output clock	R
12	PMSEL3MON	PLL3 domain clock source monitor 0: External clock 1: PLL3 output clock	R

Bit	Symbol	Function	R/W
13	PMSEL4MON	PLL4 domain clock source monitor 0: External clock 1: PLL4 output clock	R
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The PMSEL register is used to select and monitor clock source of PLL clock domain.

7.3.6 PLL0MON : PLL0 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL0MON	PLL0 Lock State Monitor This bit monitors whether the PLL0 is locked or not. 0: PLL0 is not locked 1: PLL0 is locked	R
31:1	—	These bits are read as 0.	R

The PLL0MON register is used to monitor the locking state of PLL0.

7.3.7 PLL0EN : PLL0 Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL0EN	PLL0 Enable 0: PLL0 is in standby state 1: PLL0 is released from standby state	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The PLL0EN register is used to control PLL0 standby state.

7.3.8 PLL0_SSC_CTR : PLL0 SSC Control Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PLL0MFR								—	—	PLL0MRR					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL0SSCEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL0SSCEN	PLL0 SSC Enable 0: SSC is disabled 1: SSC is enabled	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
21:16	PLL0MRR	PLL0 SSC Modulation Rate	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
31:24	PLL0MFR	PLL0 SSC Modulation Frequency	R/W

The PLL0_SSC_CTR register is used to control SSC (Spread Spectrum Clock) function of PLL0. Before changing this register, make sure that PLL0 is in standby state by PLL0EN register.

7.3.9 PLL1MON : PLL1 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL1MON	PLL1 Lock State Monitor This bit monitors whether the PLL1 is locked or not. 0: PLL1 is not locked 1: PLL1 is locked	R
31:1	—	These bits are read as 0.	R

The PLL1MON register is used to monitor the locking state of PLL1.

7.3.10 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x70

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop Specify whether to run or stop the low-speed on-chip oscillator (LOCO). 0: Stop 1: Run	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: 1. When setting the LOCOCR to make the LOCO run again after it has been stopped, start using the LOCO clock after the LOCO oscillation stabilization time (t_{LOCOWT}) has elapsed.

2. Processing to stop oscillation after the bit has been set to stop the LOCO also requires a certain amount of time. Therefore, the following restrictions apply to making the LOCO run and stopping it:
   - When setting the bit to make the LOCO run again after it has been stopped, ensure that the period over which the LOCO has been stopped is at least the LOCO oscillation stabilization time (t_{LOCOWT}).
   - To set the bit to stop the LOCO, ensure that the LOCO oscillation is stable at the time.
3. LOCO may generate glitch when it is stopped after operation. Therefore, stop CLMA5 and CLMA6 which use LOCO clock, and transit to the module stop state by MSTPCRG register before LOCO is stopped.

The LOCOCR register is used to control operation of a low-speed on-chip oscillator (LOCO).

7.3.11 HIZCTRLEN : High-Impedance Control Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x80

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CLMA4MASK	CLMA3MASK	CLMA2MASK	CLMA1MASK	CLMA0MASK	CLMA6MASK
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	1

Bit	Symbol	Function	R/W
0	CLMA6MASK	CLMA6 error mask to POE3 and POEG 0: CLMA6 error is not transferred to POE3 and POEG. 1: CLMA6 error is transferred to POE3 and POEG.	R/W
1	CLMA0MASK	CLMA0 error mask to POE3 and POEG 0: CLMA0 error is not transferred to POE3 and POEG. 1: CLMA0 error is transferred to POE3 and POEG.	R/W
2	CLMA1MASK	CLMA1 error mask to POE3 and POEG 0: CLMA1 error is not transferred to POE3 and POEG. 1: CLMA1 error is transferred to POE3 and POEG.	R/W

Bit	Symbol	Function	R/W
3	CLMA2MASK	CLMA2 error mask to POE3 and POEG 0: CLMA2 error is not transferred to POE3 and POEG. 1: CLMA2 error is transferred to POE3 and POEG.	R/W
4	CLMA3MASK	CLMA3 error mask to POE3 and POEG 0: CLMA3 error is not transferred to POE3 and POEG. 1: CLMA3 error is transferred to POE3 and POEG.	R/W
5	CLMA4MASK	CLMA4 error mask to POE3 and POEG 0: CLMA4 error is not transferred to POE3 and POEG. 1: CLMA4 error is transferred to POE3 and POEG.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The HIZCTRLEN register is used to transfer CLMA error signals to POE3 and POEG.

7.3.12 PLL2MON : PLL2 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x90

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL2MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL2MON	PLL2 Lock State Monitor This bit monitors whether the PLL2 is locked or not. 0: PLL2 is not locked 1: PLL2 is locked	R
31:1	—	These bits are read as 0.	R

The PLL2MON register is used to monitor the locking state of PLL2.

7.3.13 PLL2EN : PLL2 Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0xA0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL2EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL2EN	PLL2 Enable 0: PLL2 is in standby state 1: PLL2 is released from standby state	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The PLL2EN register is used to control PLL2 standby state.

7.3.14 PLL2_SSC_CTR : PLL2 SSC Control Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0xAC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PLL2MFR								—	—	PLL2MRR					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL2SSCEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL2SSCEN	PLL2 SSC Enable 0: SSC is disabled 1: SSC is enabled	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
21:16	PLL2MRR	PLL2 SSC Modulation Rate	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
31:24	PLL2MFR	PLL2 SSC Modulation Frequency	R/W

The PLL2_SSC_CTR register is used to control SSC function of PLL2. Before changing this register, make sure that PLL2 is in standby state by PLL2EN register.

7.3.15 PLL3MON : PLL3 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0xB0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL3MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL3MON	PLL3 Lock State Monitor This bit monitors whether the PLL3 is locked or not. 0: PLL3 is not locked 1: PLL3 is locked	R

Bit	Symbol	Function	R/W
31:1	—	These bits are read as 0.	R

The PLL3MON register is used to monitor the locking state of PLL3.

7.3.16 PLL3EN : PLL3 Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0xC0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL3EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PLL3EN	PLL3 Enable 0: PLL3 is in standby state 1: PLL3 is released from standby state	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The PLL3EN register is used to control PLL3 standby state.

7.3.17 PLL3_VCO_CTR0 : PLL3 VCO Control Register 0

Base address: SYSC_S = 0x8128_0000

Offset address: 0xC4

Bit position:	31										21						16									9						0
Bit field:	—	—	—	—	—	—	—	—	—	—	PLL3P[5:0]						—	—	—	—	—	—	PLL3M[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0

Bit	Symbol	Function	R/W
9:0	PLL3M[9:0]	PLL3 M-Divider Setting	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
21:16	PLL3P[5:0]	PLL3 P-Divider Setting	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

The PLL3_VCO_CTR0 register is used to control divider of PLL3. Before changing this register, make sure that PLL3 is in standby state by PLL3EN register.

7.3.18 PLL3_VCO_CTR1 : PLL3 VCO Control Register 1

Base address: SYSC_S = 0x8128_0000

Offset address: 0xC8

Bit position:	31															16													2	0
Bit field:	PLL3K[15:0]																—	—	—	—	—	—	—	—	—	—	—	—	PLL3S[2:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

Bit	Symbol	Function	R/W
2:0	PLL3S[2:0]	PLL3 S-Divider Setting	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
31:16	PLL3K[15:0]	PLL3 Delta-Sigma Modulator Setting	R/W

The PLL3_VCO_CTR1 register is used to control divider of PLL3. Before changing this register, make sure that PLL3 is in standby state by PLL3EN register.

7.3.19 PLL4MON : PLL4 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0xD0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL4MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL4MON	PLL4 Lock State Monitor This bit monitors whether the PLL4 is locked or not. 0: PLL4 is not locked 1: PLL4 is locked	R
31:1	—	These bits are read as 0.	R

The PLL4MON register is used to monitor the locking state of PLL4.

7.4 Selecting Input to Main Clock Oscillator

The clock signal is supplied to the main clock oscillator by connecting a resonator or by the input of an external clock signal to EXTCLKIN. The clock input mode is set based on the status of the XTAL, EXTAL, EXTCLKIN, and XTALSEL pins. For details about the settings, see Table 7.6.

Table 7.6 Clock input mode selection

Clock input mode	XTAL	EXTAL	EXTCLKIN	XTALSEL
Resonator connection	Resonator connected	Resonator connected	VSS via a resistor	VDD33 via a resistor
External clock input	Open	VSS via a resistor	Clock input	VSS via a resistor

7.4.1 Connecting a Crystal Resonator

Figure 7.2 shows an example of connecting a crystal resonator. Make sure to connect EXTCLKIN to VSS via a resister and XTALSEL to VDD33 via a resistor.

A damping resistor Rd should be added, if necessary. Because the resistor values vary depending on the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer.

When connecting a resonator to supply the clock, the frequency of the resonator should be in the frequency of the resonator for the main clock oscillator described in Table 7.7.

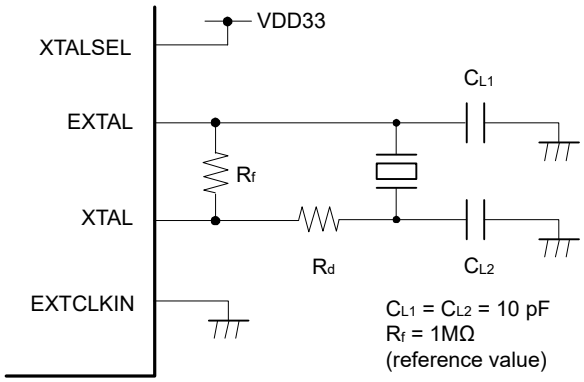

Figure 7.2 Example of crystal resonator connection

Table 7.7 Damping resistance (reference values)

Frequency (MHz)	25
Rd (Ω)	0

Figure 7.3 shows an equivalent circuit of the crystal resonator. Use a crystal resonator that has the characteristics shown in Table 7.8.

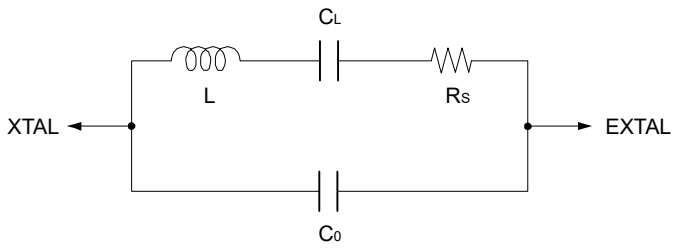

Figure 7.3 Equivalent circuit of crystal resonator

Table 7.8 Crystal resonator characteristics (reference values)

Frequency (MHz)	25
RS_{max} (Ω)	150

7.4.2 External Clock Input

Figure 7.4 shows an example connection of external clock input. Connect EXTAL to VSS via a resistor and leave XTAL open. Additionally, connect XTALSEL to VSS via a resistor.

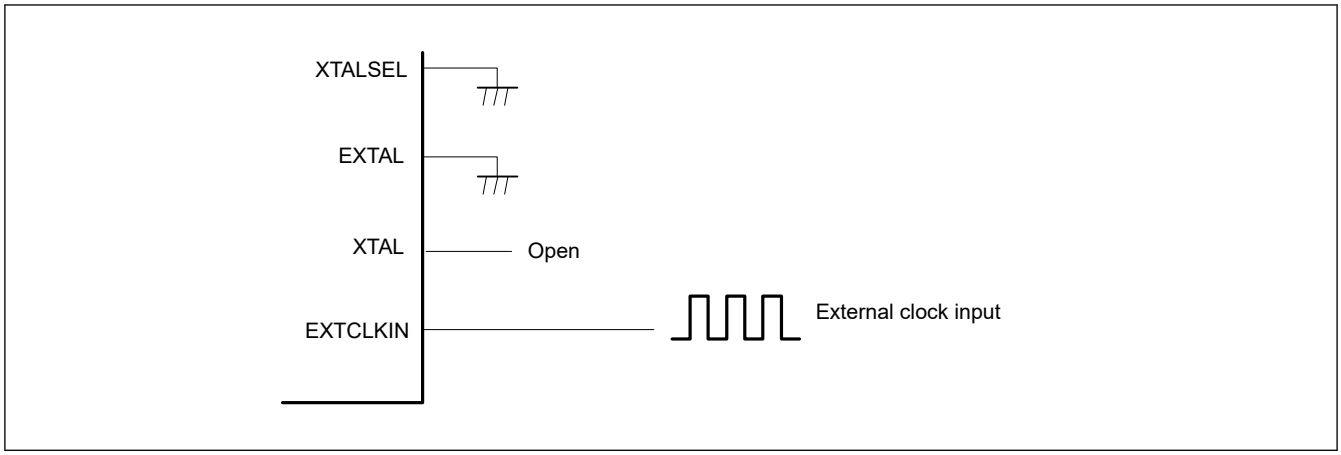

Figure 7.4 Example of external clock connection

7.5 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator. The LSI incorporates five PLL circuits (PLL0 to PLL4). In the initial state after power on, PLL1 and PLL4 are in normal mode, and PLL0, PLL2, and PLL3 are in standby mode. Start the PLL from standby state if related peripherals are used. Note that PLL0 and/or PLL2 are changed to normal mode by boot ROM automatically depending on the selected boot mode. SSC (Spread Spectrum Clock) function is available for PLL0 and PLL2 to reduce the EMI. Only down spread is supported. PLL output clock frequency must be set for PLL3. Table 7.10 shows the PLL start flow. Table 7.11 and Table 7.12 show PLL settings and constraints.

Table 7.9 PLL feature

PLL	Target	Reference clock	Output clock	Initial state	SSC function
PLL0	Cortex-A55 CPU clock	25 MHz (Main clock oscillator)	1200 MHz	Standby*1	Configurable
PLL1	Cortex-R52 CPU, main bus R and peripheral clock	25 MHz (Main clock oscillator)	1000 MHz	Normal	Non-SSC fixed
PLL2	DDRSS and SDHI clock	25 MHz (Main clock oscillator)	800 MHz	Standby*2	Configurable
PLL3	LCDC clock	48 MHz (Dividing clock of PLL4)	Configurable	Standby	Non-SSC fixed
PLL4	Main bus A and peripheral clock	25 MHz (Main clock oscillator)	2400 MHz	Normal	Non-SSC fixed

Note 1. When Cortex-A55 is the second boot CPU, Boot ROM sets PLL0 to normal mode.
Note 2. When eSD boot mode or eMMC boot mode is selected, Boot ROM sets PLL2 to normal mode.

Table 7.10 PLL start flow

No.	Process	PLL0, PLL2	PLL3
1	Confirmation of standby mode	• Confirm PLL is in standby mode by PLLnEN register.	
2	SSC setting	• Set PLLnMFR, PLLnMRR and PLLnSSCEN bits in PLLn_SSC_CTR register. See Table 7.11.	— (not supported)
3	PLL output clock frequency setting	— (not supported)	• Set PLL3P and PLL3M bits in PLL3_VCO_CTR0 register and PLL3S and PLL3K in PLL3_VCO_CTR1 register. See Table 7.12.
4	Transition to normal mode	• Set 1 to PLLnEN bit in PLLnEN register. • Poll PLLnMON bit in PLLnMON register and confirm it is set to 1, which indicates PLL is locked.	
5	Clock source change of PLL clock domain	• Poll PMSELnMON bit in PMSEL register and confirm it is set to 1, which indicates clock source change is completed.	
6	Module stop release	• Release reset of the CPU and peripheral to be used by resetting MSTPCRx register.	

Table 7.11 PLL0 and PLL2 SSC setting and constraints

Parameter	Symbol	Formula	Constraint		Unit
			Min	Max	
Modulation frequency control	mfr (PLLnMFR[7:0])	—	0x0	0xFF	—
Modulation rate control	mrr (PLLnMRR[5:0])	—	0x1	0x3F	—
—	—	mfr × mrr	0x0	0x200	—
Modulation frequency	M_{MF}	25 MHz / mfr / 2^5	30	150	kHz
Modulation rate (pk-pk)	M_{MR}	mfr × mrr / m / 2^6 × 100 (m = 96 for PLL0, 64 for PLL2)	0	5	%

Table 7.12 PLL3 setting and constraints

Parameter	Symbol	Formula	Constraint		Unit
			Min	Max	
P-divider	p (PLL3P[5:0])	—	0x1	0x3F	—
M-divider	m (PLL3M[9:0])	—	0x040	0x3FF	—
S-divider	s (PLL3S[2:0])	—	0x0	0x6	—
Delta-Sigma Modulator	k (PLL3K[15:0])	—	0x0000	0x7FFF	—
Reference frequency	F_{FREF}	48 MHz / p	6	25	MHz
VCO frequency	F_{FVCO}	(m + k / 65536) × 48 MHz / p)	1600	3200	MHz
PLL output frequency	F_{FOUT}	((m + k / 65536) × (48 MHz / p)) / 2^s	25	430	MHz

7.6 Low-Speed On-Chip Oscillator (LOCO)

The LSI incorporates low-speed on-chip oscillator (LOCO). It is used as sampling clock of CLMA6 and alternative clock of main clock and PLL clock when oscillation abnormality is detected.

After a reset is released, the LOCO is disabled. To enable this function, set the LOCO stop bit in the Low-Speed On-Chip Oscillator Control Register (LOCOCR.LCSTP) to 1.

7.7 Oscillation Abnormality Detection Function for the Main Clock

7.7.1 Main Clock Oscillation Abnormality Detection and Operation after Detection

The LSI incorporates a clock monitor circuit (CLMA6) that enables the detection of abnormal oscillation by the main clock. After a reset is released, the oscillation abnormality detection function is disabled. To enable this function, set the clock monitor enable bit in CLMA Control Register 0 (CLMA6.CTL0.CLME) to 1. For details, see section 8, Clock Monitor Circuit (CLMA).

An oscillation abnormality interrupt can be generated when an oscillation abnormality is detected. Low-speed on-chip oscillator (LOCO) clock or PLL free run clock is supplied as the system clock source instead of the main clock and PLL clock. LOCO clock or PLL free run clock is selectable by the select alternative clock bit in the System Clock Control Register (SCKCR.CLMASEL). When PLL free run clock is selected, clock frequency is not guaranteed.

In addition, the MTU3 and GPT output can be forcedly driven to the high-impedance on the detection. For details, see:

- section 18, Multi-Function Timer Pulse Unit 3 (MTU3)
- section 19, Port Output Enable 3 (POE3)
- section 20, General PWM Timer (GPT)
- section 21, Port Output Enable for GPT (POEG)

Note: If CLMA6 detects abnormal oscillation, CLMA0 to CLMA4 also generate abnormal oscillation detected interrupt when both CLMA6 and CLMA0 to CLMA4 are enabled.

7.7.2 Main Clock Oscillation Abnormality Detection Interrupt

When abnormal oscillation is detected, an abnormal oscillation detected interrupt is generated by the CLMA6 circuit, and it is transferred to the Port Output Enable 3 (POE3) block and Port Output Enable for GPT (POEG) if transmission is enabled in HIZCTRLEN register. On accepting the notification that the oscillation is to be stopped, the POE3 sets the OSTST high-impedance flag in the Input Level Control/Status Register 6 (ICSR6.OSTSTF) to 1 and the POEG also sets the Oscillation Stop Detection flags (POEGGn.OSTPF (n = A to D)) in the POEG Group n Setting Registers to 1.

The abnormal oscillation detected interrupt is connected to the Interrupt Controller Unit (ICU) as one of the error events of peripheral error interrupt so that error interrupt output and error reset are usable. When error interrupt output is used, the interrupt by all error events is disabled in the initial state after release from the reset state. To use oscillation stop detection interrupt (error event), release mask of the event in PRIERR_RSTMSK0 register when the ICU detects an error event. For details, see section 12, Interrupt Controller (ICU).

Note: If an abnormality in oscillation of the main clock occurs, oscillation of the PLL0 to PLL4 clock source also becomes abnormal, which may result in incorrect operation of the CPU. The POE3 and POEG set the high-impedance flag regardless of the state of the CPU, and the MTU3 and GPT outputs are driven to the high-impedance state.

7.8 PLL Oscillation Abnormality Detection Function

The PLL oscillation abnormality detection function detects an abnormality in oscillation of the PLL0 to PLL4 by using the Clock Monitor Circuits (CLMA0 to CLMA4) to monitor the frequency. It then supplies the main clock instead of the PLL0 to PLL4 clock. For details about the CLMA, see section 8, Clock Monitor Circuit (CLMA).

When abnormal oscillation is detected, an abnormal oscillation detected interrupt is generated by the CLMA0 to CLMA4 circuit, and it is transferred to POE3 and POEG if transmission is enabled in HIZCTRLEN register. On accepting the notification that the oscillation is to be stopped, the POE3 sets the OSTST high-impedance flag in the Input Level Control/Status Register 6 (ICSR6.OSTSTF) to 1 and the POEG also sets the Oscillation Stop Detection flags (POEGGn.OSTPF (n = A to D)) in the POEG Group n Setting Registers to 1.

The abnormal oscillation detected interrupt is connected to the Interrupt Controller Unit (ICU) as one of the error events of peripheral error interrupt so that error interrupt output and error reset are usable. When error interrupt output is used, the interrupt by all error events is disabled in the initial state after release from the reset state. To use oscillation stop detection interrupt (error event), release mask of the event in PRIERR_RSTMSK0 register when the ICU detects an error event. For details, see section 12, Interrupt Controller (ICU) .

7.9 Low-Speed On-Chip Oscillator Oscillation Abnormality Detection Function

The clock monitor circuit (CLMA5) can be used to detect an abnormality in oscillation of the low-speed on-chip oscillator. For details about the CLMA, see section 8, Clock Monitor Circuit (CLMA).

7.10 Internal Clock

Clock sources of internal clock signals are the main clock, LOCO clock, PLL clock, and the external clock for JTAG. Multiple internal clocks listed in Table 7.13 are produced from these sources.

Table 7.13 Overview of Clock Generation Circuit Specifications (Internal Clock) (1 of 4)

Clock name	Description
Cortex-A55 Core0 clock (CA55C0CLK)	The Cortex-A55 Core0 clock (CA55C0CLK) is used as the operating clock of the Cortex-A55 Core0. The Cortex-A55 Core0 operating frequency is specified by the SCKCR2.CA55CORE0 bit. Frequency of Cortex-A55 Core0 is selectable from 600 MHz or 1200 MHz.
Cortex-A55 Core1 clock (CA55C1CLK)	The Cortex-A55 Core1 clock (CA55C1CLK) is used as the operating clock of the Cortex-A55 Core1. The Cortex-A55 Core1 operating frequency is specified by the SCKCR2.CA55CORE1 bit. Frequency of Cortex-A55 Core1 is selectable from 600 MHz or 1200 MHz.
Cortex-A55 Core2 clock (CA55C2CLK)	The Cortex-A55 Core2 clock (CA55C2CLK) is used as the operating clock of the Cortex-A55 Core2. The Cortex-A55 Core2 operating frequency is specified by the SCKCR2.CA55CORE2 bit. Frequency of Cortex-A55 Core2 is selectable from 600 MHz or 1200 MHz.
Cortex-A55 Core3 clock (CA55C3CLK)	The Cortex-A55 Core3 clock (CA55C3CLK) is used as the operating clock of the Cortex-A55 Core3. The Cortex-A55 Core3 operating frequency is specified by the SCKCR2.CA55CORE3 bit. Frequency of Cortex-A55 Core3 is selectable from 600 MHz or 1200 MHz.

Table 7.13 Overview of Clock Generation Circuit Specifications (Internal Clock) (2 of 4)

Clock name	Description
Cortex-A55 DSU clock (CA55SCLK)	The Cortex-A55 DSU clock (CA55SCLK) is used as the operating clock of the Cortex-A55 DSU. The Cortex-A55 DSU operating frequency is specified by the SCKCR2.CA55SCLK bit. Frequency of Cortex-A55 DSU is selectable from 500 MHz or 1000 MHz.
Cortex-R52 CPU0 clock (CR52C0CLK)	The Cortex-R52 CPU0 clock (CR52C0CLK) is used as the operating clock of the Cortex-R52 CPU0. The Cortex-R52 CPU0 operating frequency is specified by the SCKCR2.CR52CPU0 bits. Frequency of Cortex-R52 CPU0 is selectable from 500 MHz or 1000 MHz.
Cortex-R52 CPU1 clock (CR52C1CLK)	The Cortex-R52 CPU1 clock (CR52C1CLK) is used as the operating clock of the Cortex-R52 CPU1. The Cortex-R52 CPU1 operating frequency is specified by the SCKCR2.CR52CPU1 bits. Frequency of Cortex-R52 CPU1 is selectable from 500 MHz or 1000 MHz.
Peripheral module clock AH (PCLKAH)	The peripheral module clock AH (PCLKAH) is used as the operating clock and/or bus clock for high-speed peripheral modules such as PCIE, LCDC (clk_a), GMAC unit 1, 2 (ACLK), DDRSS (A0, A1, A4), and Main bus A. The PCLKAH frequency is fixed to 400 MHz, and cannot be user-specified.
Peripheral module clock AM (PCLKAM)	The peripheral module clock AM (PCLKAM) is used as the operating clock and/or bus clock for middle-speed peripheral modules such as USB, GMAC unit 1, 2 (HCLK), and SDHI. The PCLKAM frequency is fixed to 200 MHz, and cannot be user-specified.
Peripheral module clock AL (PCLKAL)	The peripheral module clock AL (PCLKAL) is used as the operating clock and/or bus clock for low-speed peripheral modules such as LCDC (clk_p). The PCLKAL frequency is fixed to 100 MHz, and cannot be user-specified.
SDHI clock (SDHI_clkhs)	The SDHI clock is used as the operating clock for SDHI module. The SDHI_clkhs frequency is fixed to 800 MHz, and cannot be user-specified.
DDR controller DFI clock (DFICLK)	The DDR controller clock (DFICLK) is used as the operating clock for DDR controller. The DFICLK frequency is fixed to 800 MHz, and cannot be user-specified.
LCDC clock (LCDC_clkd)	LCDC clock (LCDC_clkd) is used as the operating clock for LCDC. The LCDC_clkd frequency is adjustable by selecting PLL3 output clock frequency setting and external divider setting. PLL3_VCO_CTR0 and PLL3_VCO_CTR1 registers specify PLL3 output clock frequency and SCKCR3.LCDDIVSEL bits specify external divider outside PLL3.
Peripheral module clock H (PCLKH)	The peripheral module clock H (PCLKH) is used as the operating clock and/or bus clock for high-speed peripheral modules such as MTU3, GPT connected to LLPP bus, TFU, DSMIF, POE3, POEG (LLPP), ADC12 unit 0, 1 (bus), xSPI (bus), DMAC, MPU, GMAC unit 0 (ACLK), SHOSTIF (pclk, mhclk), ENCIFSS (bus), ELC, RSIP, System SRAM, DDRSS (R2, R3), MBXSEM, and Main bus R. The PCLKH frequency is fixed to 250 MHz, and cannot be user-specified.
Peripheral module clock M (PCLKM)	The peripheral module clock M (PCLKM) is used as the operating clock and/or bus clock for middle-speed peripheral modules such as CRC, SCI (bus), SPI (bus), GPT (Non Safety, Safety), CANFD (bus), ETHSW (bus), GMAC unit 0 (HCLK), OTP, Ethernet SS Reg, GPIO, CLMA, ADC12 unit 2 (bus), and ICU. The PCLKM frequency is fixed to 125 MHz, and cannot be user-specified.
Peripheral module clock L (PCLKL)	The peripheral module clock L (PCLKL) is used as the operating clock and/or bus clock for low-speed peripheral modules such as POEG (Non Safety, Safety), IIC, DOC, CMT, CMTW, WDT, RTC, TSU, DDRSS (PHY_Reg), and ADC12 (conversion). The PCLKL frequency is fixed to 62.5 MHz, and cannot be user-specified.
Peripheral module clock for GPT in LLPP (PCLKGPTL)	The peripheral module clock for GPT in LLPP (PCLKGPTL) is used as the operational clock for GPT in LLPP. Frequency of PCLKGPTL is fixed to 500 MHz, and cannot be user-specified.
Peripheral module clock for DSMIFn (PCLKDSMIFn) (n = 0 to 9)	The peripheral module clock for DSMIF (PCLKDSMIFn) is used as the operational clock for DSMIFn. The PCLKDSMIFn frequency is specified by the DSMIFn.DSCCSCR.CLKSEL0 bit. It is selectable from 250 MHz or 400 MHz.
Peripheral module clock for SCI / SCIE (PCLKSCIn / PCLKSCIEm) (n = 0 to 5, m = 0 to 11)	The peripheral module clock for SCIn/SCIEm (PCLKSCIn/PCLKSCIEm) is used as the operating clock for SCIn/SCIEm. The PCLKSCIn/PCLKSCIEm frequency is specified by the combination of SCKCR3.SCInASYNCSEL (n = 0 to 4) or SCKCR2.SCInASYNCSEL (n = 5) or SCKCR4.SCIEmASYNCSEL (m = 0 to 11) bits and the SCIn/SCIEm.CCR3.BPEN bit. SCIn/SCIEm.CCR3.BPEN bit specifies which clock is used, synchronous clock (1) or asynchronous clock (0). When the bit is set to 1 (synchronous clock), the frequency of PCLKSCIn/PCLKSCIEm is the same as PCLKM (125 MHz). When the bit is set to 0 (asynchronous clock), the frequency of PCKLSCIn/PCLKSCIEm is the clock frequency selected by SCKCR3.SCInASYNCSEL (n = 0 to 4) or SCKCR2.SCInASYNCSEL (n = 5) or SCKCR4.SCIEmASYNCSEL (m = 0 to 11) bits. It is selectable from 75, 80, 96, or 100 MHz. Setting is independent for each channel.

Table 7.13 Overview of Clock Generation Circuit Specifications (Internal Clock) (3 of 4)

Clock name	Description
Peripheral module clock for SPI (PCLKSPIn) (n = 0 to 3)	The peripheral module clock for SPIn (PCLKSPIn) is used as the operating clock for SPIn. The PCLKSPIn frequency is specified by combination of the SCKCR3.SPInASYNCSEL (n = 0 to 2) or SCKCR2.SPInASYNCSEL (n = 3) bits and the SPIn.SPCR.BPEN bit. SPIn.SPCR.BPEN bit specifies which clock is used, synchronous clock (1) or asynchronous clock (0). When the bit is set to 1 (synchronous clock), the frequency of PCLKSPIn is the same as PCLKM (125 MHz). When the bit is set to 0 (asynchronous clock), the frequency of PCKLSPIn is the clock frequency selected by SCKCR3.SPInASYNCSEL (n = 0 to 2) or SCKCR2.SPInASYNCSEL (n = 3) bits. It is selectable from 75, 80, 96, or 100 MHz. Setting is independent for each channel.
Peripheral module clock for CANFD (PCLKCAN)	The peripheral module clock for CANFD (PCLKCAN) is used as the serial clock for CANFD. The PCLKCAN frequency is specified by the SCKCR.FSELCANFD bit. It is selectable from 40 MHz or 80 MHz.
Peripheral module clock for SHOSTIF (PCLKSHOST)	The peripheral module clock for SHOSTIF (PCLKSHOST) is used as the operating clock for SHOSTIF. The PCLKSHOST frequency is fixed to 400 MHz, and cannot be user-specified.
External bus clock (BSC_CLK, CKIO)	The external bus clock (CKIO) is used as an operating clock. The CKIO operating frequency is selectable from PCLKH/2, PCLKH/3, PCLKH/4, PCLKH/5, PCLKH/6, PCLKH/7, or PCLKH/8 by the SCKCR.CKIO bits.
Peripheral module clock for RTC (PCLKRTC)	The peripheral module clock for RTC (PCLKRTC) is used as the operational clock for RTC. The PCLKRTC frequency is fixed to 195.3 kHz, and cannot be user-specified.
USB clock (USB_CLK)	The USB clock is used as the reference clock for USB PHY layer. The USB clock frequency is fixed to 50 MHz, and cannot be user-specified.
xSPIn serial clock (XSPI_CLKn) (n = 0, 1)	The xSPI serial clock for xSPIn (XSPI_CLKn) is used as the serial clock for xSPIn. Clock frequency is selectable by combination of the SCKCR.FSELXSPIn and DIVSELXSPIn bits.
Ethernet clock A (ETCLKA)	The Ethernet clock A (ETCLKA) is used as the operating clock for ETHSW. The ETCLKA frequency is fixed to 200 MHz, and cannot be user-specified.
Ethernet clock B (ETCLKB)	The Ethernet clock B (ETCLKB) is a clock for GMAC, ETHSW, and MII converter. The ETCLKB frequency is fixed to 125 MHz, and cannot be user-specified.
Ethernet clock C (ETCLKC)	The Ethernet clock C (ETCLKC) is a clock for ESC. The ETCLKC frequency is fixed to 100 MHz, and cannot be user-specified.
Ethernet clock D (ETCLKD)	The Ethernet clock D (ETCLKD) is a clock for MII Converter. The ETCLKC frequency is fixed to 50 MHz, and cannot be user-specified.
Ethernet clock E (ETCLKE)	The Ethernet clock E (ETCLKE) is a clock for ESC and MII converter. The ETCLKE frequency is fixed to 25 MHz, and cannot be user-specified.
CLMAn sampling clock (CLMAMCLKA) (n = 0, 1, 2, 4)	The CLMAn (n = 0, 1, 2, 4) sampling clocks (CLMAMCLKA) are for use with CLMA0, CLMA1, CLMA2, and CLMA4. The CLMAMCLKA frequency is fixed to 12.5 MHz, and cannot be user-specified.
CLMA3 sampling clock (CLMAMCLKB)	The CLMA3 sampling clock (CLMAMCLKB) is for use with CLMA3. The CLMAMCLKB frequency is fixed to 1.56 MHz, and cannot be user-specified.
CLMA5 sampling clock (CLMAMCLKC)	The CLMA5 sampling clock (CLMAMCLKC) is for use with CLMA5. The CLMAMCLKC frequency is fixed to 97.6 kHz, and cannot be user-specified.
CLMA0 monitor clock (CLMAPLCLK0)	The CLMA0 monitor clock (CLMAPLCLK0) is the monitoring clock for use with CLMA0. The CLMAPLCLK0 frequency is fixed to 75 MHz, and cannot be user-specified.
CLMA1 monitor clock (CLMAPLCLK1)	The CLMA1 monitor clock (CLMAPLCLK1) is the monitoring clock for use with CLMA1. The CLMAPLCLK1 frequency is fixed to 62.5 MHz, and cannot be user-specified.
CLMA2 monitor clock (CLMAPLCLK2)	The CLMA2 monitor clock (CLMAPLCLK2) is the monitoring clock for use with CLMA2. The CLMAPLCLK2 frequency is fixed to 50 MHz, and cannot be user-specified.
CLMA3 monitor clock (CLMAPLCLK3)	The CLMA3 monitor clock (CLMAPLCLK3) is the monitoring clock for use with CLMA3. The CLMAPLCLK3 frequency is selectable from 6.25 MHz to 107.5 MHz.
CLMA4 monitor clock (CLMAPLCLK4)	The CLMA4 monitor clock (CLMAPLCLK4) is the monitoring clock for use with CLMA4. The CLMAPLCLK4 frequency is fixed to 75 MHz, and cannot be user-specified.
CLMA5 monitor clock (CLMALCLK)	The CLMA5 monitor clock (CLMAPLCLK) is the monitoring clock for use with CLMA5. The CLMALCLK frequency is fixed to 1 MHz, and cannot be user-specified.
CLMA6 monitor clock (CLMAMCLK)	The CLMA6 monitor clock (CLMAMCLK) is the monitoring clock for use with CLMA6. The CLMAMCLK frequency is fixed to 12.5 MHz, and cannot be user-specified.
JTAG clock (JTAGTCK)	The JTAG clock (JTAGTCK) is the operating clock for JTAG. JTAGTCK is generated by the external clock for JTAG (TCK).

Table 7.13 Overview of Clock Generation Circuit Specifications (Internal Clock) (4 of 4)

Clock name	Description
Serial Host I/F clock (SHIFCLK)	The Serial Host I/F clock (SHIFCLK) is used as the interface clock for SHOSTIF. The SHIFCLK frequency is up to 40 MHz.
EnDat Clock (PCLKENDAT)	The EnDat clock (PCLKENDAT) is used as the operating clock for EnDat. The PCLKENDAT is fixed to 100 MHz, and cannot be user-specified.
BiSS-C Clock (PCLKBISS)	The BiSS-C clock (PCLKBISS) is used as the operating clock for BiSS-C. The PCLKBISS is fixed to 80 MHz, and cannot be user-specified.
HIPERFACE DSL Clock (PCLKHDSL)	The HIPERFACE DSL clock (PCLKHDSL) is used as the operating clock for HIPERFACE. The PCLKHDSL is fixed to 75 MHz, and cannot be user-specified.
A-format Clock (PCLKAFMT)	The A-format clock (PCLKAFMT) is used as the operating clock for A-format. The PCLKAFMT is fixed to 80 MHz, and cannot be user-specified.
ENCOUT clock (PCLKENCO)	The ENCOUT clock (PCLKENCO) is used as the operating clock for ENCOUT. The PCLKENCO frequency is specified by the SCKCR4.ENCOUTCLK bit. It is selectable from 20 MHz or 80 MHz.

7.11 Reference Clock to the External Ethernet PHY

The LSI provides reference clocks to the external Ethernet PHY.

Table 7.14 List of reference clock to the external Ethernet PHY

Clock name	Description
ETHn_REFCLK (n = 0 to 3)	25 MHz reference clock to the external Ethernet PHY. Clock source is selectable from main clock or frequency-dividing clock for PLL1 by the SCKCR.PHYSEL bit.
RMIIn_REFCLK (n = 0 to 3)	50 MHz reference clock to the external Ethernet PHY for RMII.

7.12 Usage Notes

7.12.1 Notes on Clock Generation Circuit

1. The operating frequency of xSPI interface, the external bus clock (CKIO), and CANFD serial clock that are supplied to the modules based on the SCKCR and SCKCR2 register settings varies before and after the frequency is changed. Do not change the clock frequency during access via the external interface. To start access via the external interface after the clock frequency is changed, confirm that the change to the frequency has been completed before you start access via the interface.
2. Do not change the clock frequency of the PCLKSPIn or PCLKSCIn/PCKJSCIEm while the SPIn (channels 0 to 3) or the SCIn/SCIEm (channels 0 to 5 for SCIn and channels 0 to 11 for SCIEm) is operating. To cancel the module-stop state after the clock frequency is changed, confirm that the change to the frequency is completed before you cancel the module-stop state.
3. In order to secure the processing after the clock frequency is changed, modify the pertinent clock control register to change the frequency, and then perform a dummy read of the register at least seven times. Then perform the subsequent processing.
4. In order to secure processing after release from the module-stop state, dummy read the same register at least seven times except RTC and LCDC after writing to initiate release from the module-stop state, and only then proceed with the subsequent processing. For RTC, dummy read the same register at least 300 times and for LCDC, at least 100 times.
5. When controlling the module-stop state of the modules that initiate DMA transfer or that otherwise operate in relation with other blocks, confirm that DMAC transfer initiated by such modules and other points of interlinked operation are completed before releasing modules from or placing modules in the module-stop state. For set products in which such target modules are not used, design of the control of the module-stop state is on the assumption that the clocks are initially stopped. Therefore, the absence of unexpected operations in states other than the specified is not guaranteed. For example, operation after releasing modules from or placing modules in the module-stop state while a module is running is not guaranteed. For details on the operation and stopping of individual modules, see the section on processing by the corresponding block.

7.12.2 Notes on Resonator

Since various resonator characteristics relate closely to the user's board design, adequate evaluation is required on the user side before use, referencing the resonator connection example shown in this section. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, the circuit constants should be determined in full consultation with the resonator manufacturer. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

7.12.3 Notes on Designing the Board

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 7.5. This prevents electromagnetic induction from interfering with correct oscillation.

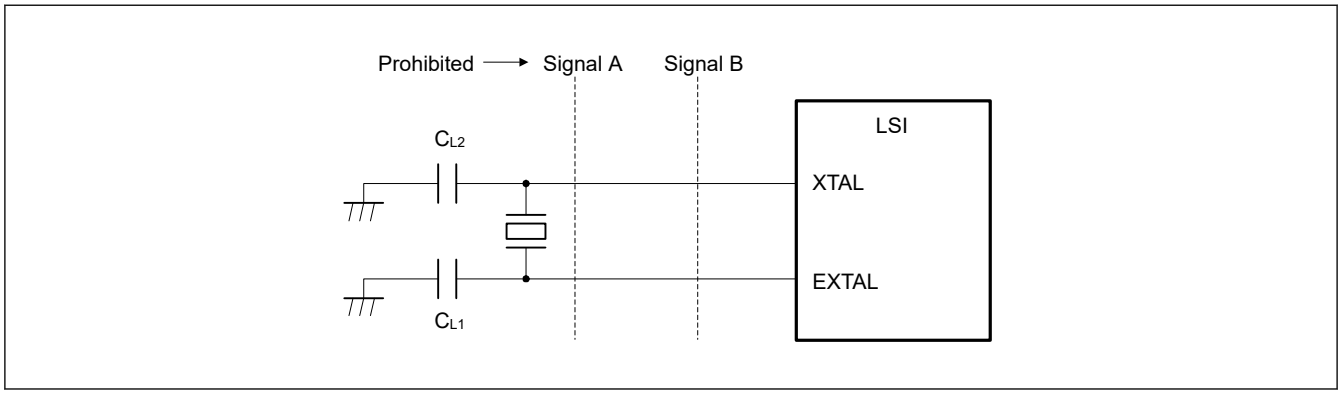

Figure 7.5 Notes on board design for oscillation circuit

8. Clock Monitor Circuit (CLMA)

8.1 Overview

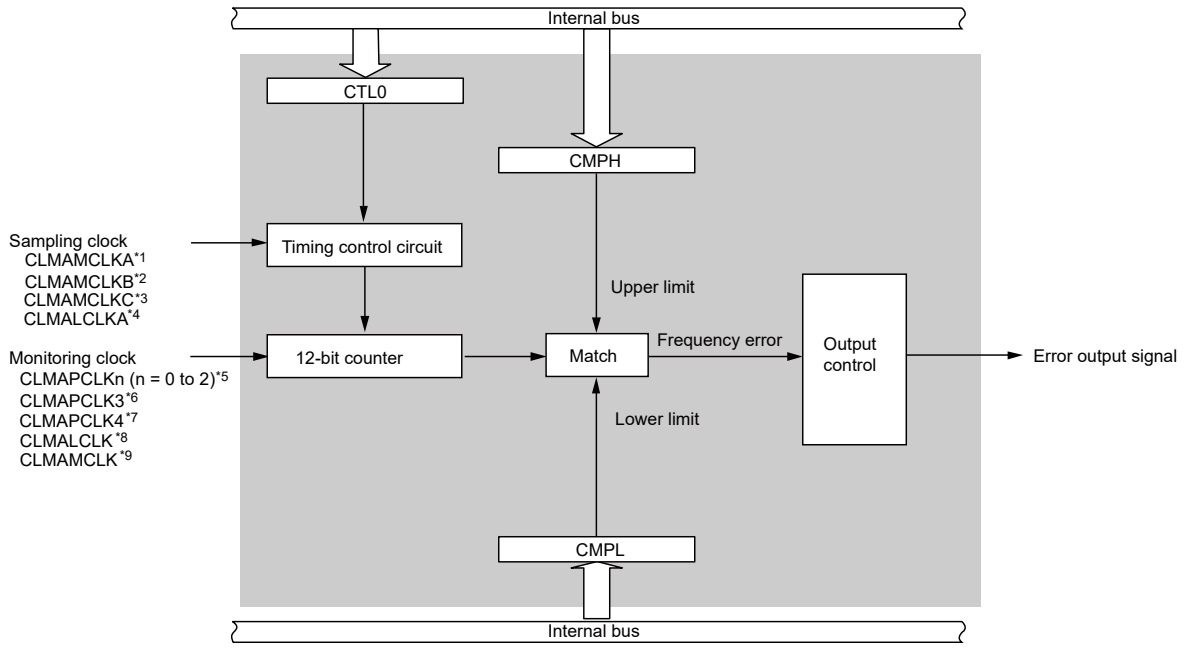
A clock monitor circuit, CLMAm (m = 0 to 6), can detect a frequency error in PLL0 to PLL4 output, low-speed on-chip oscillator (LOCO) output, or main clock. During 16 cycles of the sampling clock, it counts the rising edges of the monitoring clock (frequency-dividing clock from PLL0 to PLL4, LOCO, or main clock), and then compares the counter value with the compare register.

When CLMAm detects an error, error events are generated and sent to the interrupt controller (ICU).

Table 8.1 lists the specifications of CLMAm and Figure 8.1 shows a block diagram.

Table 8.1 CLMAm (m = 0 to 6) specifications

Parameter	Description
Monitoring clock	The following monitoring clock frequency errors can be detected: • PLL0 output clock divided by 16 (CLMAPLCLK0, which is to be supplied to CLMA0): 75 MHz • PLL1 output clock divided by 16 (CLMAPLCLK1, which is to be supplied to CLMA1): 62.5 MHz • PLL2 output clock divided by 16 (CLMAPLCLK2, which is to be supplied to CLMA2): 50 MHz • PLL3 output clock divided by 4 (CLMAPLCLK3, which is to be supplied to CLMA3): 6.25 to 107.5 MHz • PLL4 output clock divided by 32 (CLMAPLCLK4, which is to be supplied to CLMA4): 75 MHz • Low-speed on-chip oscillator (LOCO) output clock (CLMALCLK, which is to be supplied to CLMA5): 1 MHz • Clock which equals to the main clock frequency divided by 2 (CLMAMCLK, which is to be supplied to CLMA6): 12.5 MHz
Sampling clock	The following clock frequency errors are monitored as the sampling clock: • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA0): 12.5 MHz • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA1): 12.5 MHz • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA2): 12.5 MHz • Clock which equals to the main clock frequency divided by 16 (CLMAMCLKA, which is to be supplied to CLMA3): 1.5625 MHz • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKB, which is to be supplied to CLMA4): 12.5 MHz • Clock which equals to the main clock frequency divided by 256 (CLMAMCLKC, which is to be supplied to CLMA5): 97.7 kHz • Clock which equals to LOCO frequency (CLMALCLKA, which is to be supplied to CLMA6): 1 MHz
Error event	When CLMAm detects a frequency error, error events are generated and sent to the interrupt controller (ICU). • CLMA0 error detection interrupt • CLMA1 error detection interrupt • CLMA2 error detection interrupt • CLMA3 error detection interrupt • CLMA4 error detection interrupt • CLMA5 error detection interrupt • CLMA6 error detection interrupt



Note 1. Main clock frequency divided by 2 to be supplied to CLMA0, CLMA1, CLMA2, and CLMA4.
Note 2. Main clock frequency divided by 16 to be supplied to CLMA3.
Note 3. Main clock frequency divided by 256 to be supplied to CLMA5.
Note 4. Low-speed on-chip oscillator (LOCO) output clock to be supplied to CLMA6.
Note 5. PLL0, PLL1, and PLL2 output clock divided by 16 to be supplied to CLMA0, CLMA1, and CLMA2.
Note 6. PLL3 output clock divided by 4 to be supplied to CLMA3.
Note 7. PLL4 output clock divided by 32 to be supplied to CLMA4.
Note 8. Low-speed on-chip oscillator (LOCO) output clock to be supplied to CLMA5.
Note 9. Main clock frequency divided by 2 to be supplied to CLMA6.

8.3 Register Descriptions

8.3.1 CTL0 : CLMA Control Register 0

Base address: CLMAm = 0x8128_8000 + 0x0020 × m (m = 0 to 6)

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CLME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLME	Clock Monitor m Enable (m = 0 to 6) Enables or disables operation of clock monitor circuit CLMAm. 0: Disables CLMAm operation 1: Enables CLMAm operation*1	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Once the CLME bit is set to 1, it cannot be cleared by any operation other than RES# pin reset, system software reset, and error reset.

The CTL0 registers control operation of clock monitor circuit CLMAm. Writing to these registers is protected by a specific command sequence. For details, see (1) Enabling operations.

8.3.2 CMPL : CLMA Compare Register L

Base address: CLMAm = 0x8128_8000 + 0x0020 × m (m = 0 to 6)

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CMPL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
11:0	CMPL[11:0]	Clock Monitor m Compare L (m = 0 to 6) Specify the lower-limit threshold for the frequency domain.*1 ● For details, see (2) Method of calculating threshold values, the CMPL and CMPH registers. Recommended value: $f_{CLMATMON}$ (min) / $f_{CLMATSMP}$ (max) × 16 - 1 $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency ● Minimum value: 0x0001	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. To set the CMPL registers, the following conditions must be met:
1. 1 ≤ CMPL
2. CMPL + 3 ≤ CMPH

The CMPL registers set the lower limit for comparing frequency domains. Values can be written to these registers when CTL0.CLME = 0. When CTL0.CLME = 1, writing to these registers has no effect.

8.3.3 CMPH : CLMA Compare Register H

Base address: CLMAm = 0x8128_8000 + 0x0020 × m (m = 0 to 6)

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CMPH[11:0]											
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
11:0	CMPH[11:0]	Clock Monitor m Compare H (m = 0 to 6) Specify the upper-limit threshold for the frequency domain.*1 ● For details, see (2) Method of calculating threshold values, the CMPL and CMPH registers. Recommended value: $f_{CLMATMON}$ (max) / $f_{CLMATSMP}$ (min) × 16 + 1 $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency ● Minimum value: CMPL + 0x0003	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. To set the CMPH registers, the following conditions must be met:
- 1 ≤ CMPL
- CMPL + 3 ≤ CMPH

The CMPH registers set the upper limit for comparing frequency domains. Values can be written to these registers when CTL0.CLME = 0. When CTL0.CLME = 1, writing to these registers has no effect.

8.3.4 PCMD : CLMA Command Register

Base address: CLMAm = 0x8128_8000 + 0x0020 × m (m = 0 to 6)

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	n/a	CLMAm Protect Key Code (m = 0 to 6) Write a specific command sequence.	W

The PCMD registers control writing to the protected registers.

For details, see (1) Enabling operations.

8.3.5 PROTSR : CLMA Protection Status Register

Base address: CLMAm = 0x8128_8000 + 0x0020 × m (m = 0 to 6)

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PRERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRERR	CLMAm Error (m = 0 to 6) 0: No protection error occurred 1: A protection error occurred	R
7:1	—	These bits are read as 0.	R

The PROTSR registers indicate whether writing to the protected register is performed correctly. If writing is not performed correctly, a protection error occurs and the PROTSR.PRERR bit is set to 1.

For details, see (1) Enabling operations.

8.4 Operation

8.4.1 CLMAm Operation

(1) Enabling operations

Setting the CTL0.CLME bit to 1 starts monitoring the monitoring clock (PLL0 to PLL2 output divided by 16, PLL3 output divided by 4, PLL4 output divided by 32, LOCO output, and main clock divided by 2) by using clock monitor circuit CLMAm (m = 0 to 6) output. To write 1 in the CTL0.CLME bit, use the following command sequence:

1. Write 0xA5 to the PCMD register.
2. Writing to CTL0 is performed with the following sequence:
   (a) Write the target setting value (0x01).
   (b) Write the reversed value of the target (0xFE).
   (c) Write the target value (0x01) again.
3. Read CTL0.
   When the value of CTL0 shows 0x01, the operation of CLMAm is enabled. If it shows another value, check the value of PROTSR register.

When PROTSR = 0x01, the command sequence is not performed correctly. Execute the sequence again from step 1 to perform writing.

(2) Stopping operations

When a sampling clock stops due to register operation, the corresponding clock monitor circuit (CLMAm) is disabled automatically. After that, when the monitoring clock starts oscillating again and stabilizes, CLMAm resumes operation.

Table 8.4 Monitoring clock and sampling clock each CLMAm

Parameter		CLMA0	CLMA1	CLMA2	CLMA3	CLMA4	CLMA5	CLMA6
Detection target	Clock	PLL0 output clock	PLL1 output clock	PLL2 output clock	PLL3 output clock	PLL4 output clock	LOCO	Main clock
	Frequency	1200 MHz	1000 MHz	800 MHz	25 MHz to 430 MHz	2400 MHz	1 MHz	25 MHz
Monitoring clock	Clock	PLL0 output clock divided by 16	PLL1 output clock divided by 16	PLL2 output clock divided by 16	PLL3 output clock divided by 4	PLL4 output clock divided by 32	LOCO	Main clock divided by 2
	Frequency	75.0 MHz	62.5 MHz	50.0 MHz	6.25 MHz to 107.5 MHz	75.0 MHz	1.0 MHz	12.5 MHz
Sampling clock	Clock	Main clock divided by 2	Main clock divided by 2	Main clock divided by 2	Main clock divided by 16	Main clock divided by 2	Main clock divided by 256	LOCO
	Frequency	12.5 MHz	12.5 MHz	12.5 MHz	1.56 MHz	12.5 MHz	97.7 kHz	1.0 MHz

8.4.2 Detecting Error Clock Frequency

(1) Detection Method

1. During 16 cycles of the sampling clock (main clock frequency dividing clock and LOCO), CLMAm counts the rising edge of the monitoring clock (PLL0 to PLL2 output divided by 16, PLL3 output divided by 4, PLL4 output divided by 32, LOCO output, and main clock divided by 2), and compares the counter value with the set threshold (m = 0 to 6).
   - CMPL.CMPL[11:0] set the lower-limit threshold of the frequency domain.
   - CMPH.CMPH[11:0] set the upper-limit threshold of the frequency domain.
2. If the monitoring clock shows a value lower than the expected frequency, the counter value shows a value lower than the setting of CMPL.CMPL[11:0].
3. If the monitoring clock shows a value higher than the expected frequency, the counter value shows a value higher than the setting of CMPH.CMPH[11:0].

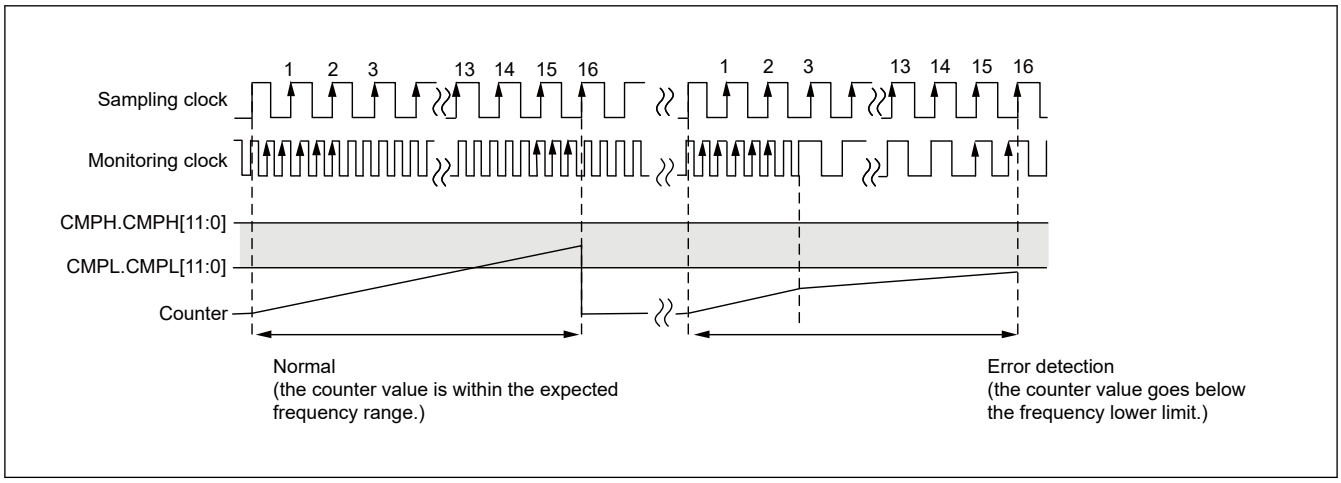

Figure 8.2 Example when the monitoring clock shows a value lower than the expected frequency

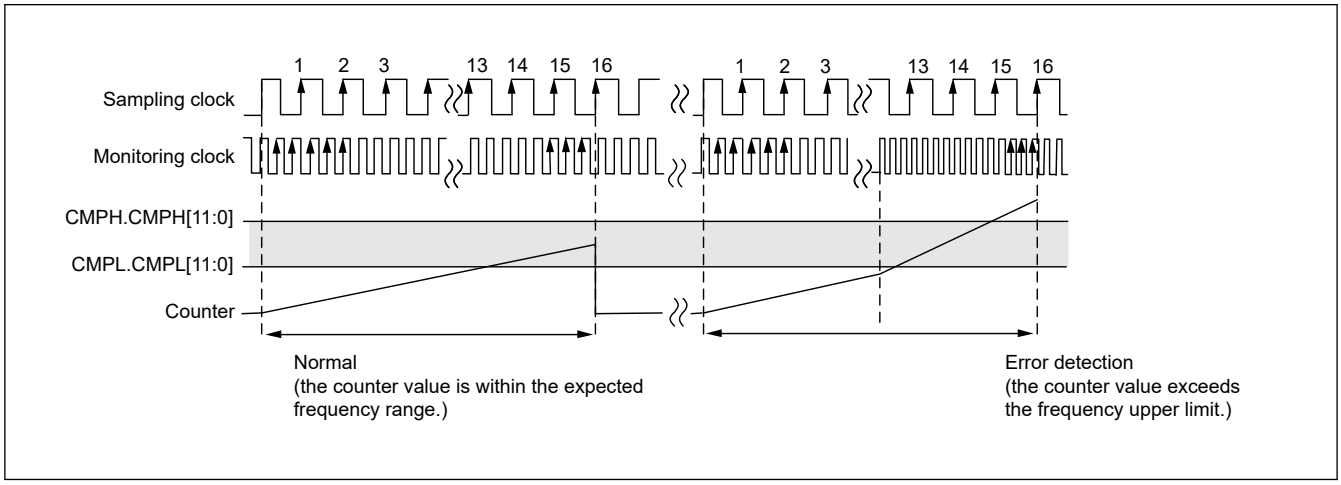

Figure 8.3 Example when the monitoring clock shows a value higher than the expected frequency

Note: No error is detected if the monitoring clock frequency changes within a sampling interval, and it eventually stays within a valid counter value. A monitoring clock error is detected after a sampling interval (16 cycles of the sampling clock).

(2) Method of calculating threshold values, the CMPL and CMPH registers

For compare registers CMPL and CMPH, set the minimum and maximum values of the number of cycles (the number of rising edges) for the monitoring clock which is assumed to be normal within 16 cycles of the sampling clock (main clock frequency dividing clock and LOCO).

$f_{CLMATSMP}$ indicates the sampling clock frequency, $f_{CLMATMON}$ indicates the monitoring clock frequency, and N indicates the number of cycles (rising edges) of the monitoring clock, which is expected within 16 cycles of the sampling clock.

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Consider the allowable frequency deviations for the monitoring clock and the sampling clock, use the following formula to calculate the threshold:

$$\text{Lower-limit threshold} = N_{min} = \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper-limit threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

Note: Set the threshold within the following range:
CMPL ≥ 0x0001
CMPH ≥ CMPL + 0x0003

(3) Example: For CLMA0

For example, when the sampling clock equals to the main clock frequency divided by 2, $f_{CLMATSMP}$ = 12.5 MHz (±5%), or the monitoring clock equals to PLL0 output divided by 16, $f_{CLMATMON}$ = 75 MHz (±5%), the recommended threshold is calculated as follows:

$$N_{min} = \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} = \frac{71.25}{13.125} \times 16 - 1 = 85.86$$

$$CMPL = 86 = 0x0056$$

$$N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} = \frac{78.75}{11.875} \times 16 + 1 = 107.11$$

$$CMPH = 107 = 0x006B$$

8.4.3 Detecting Error Clock Frequency

When the monitoring clock frequency (PLL0 to PLL2 output divided by 16, PLL3 output divided by 4, PLL4 output divided by 32, LOCO output, and main clock divided by 2) is higher than the upper-limit threshold or lower than the lower-limit threshold, any of the following signals is sent to the interrupt controller (ICU) as error event:

- CLMA0 error detection interrupt
- CLMA1 error detection interrupt
- CLMA2 error detection interrupt
- CLMA3 error detection interrupt
- CLMA4 error detection interrupt
- CLMA5 error detection interrupt
- CLMA6 error detection interrupt

Error signal can be cleared by RES# pin reset, System software reset, or Error reset only.

8.5 Notes on Using CLMAm

- Do not use a clock for which CLMAm detected an error. If you use the clock, operation of the device is not guaranteed.
- No multiple clocks but only single monitoring clock error is assumed at the same time.
- Abnormality of the main clock oscillator may cause not only CLMA6 error but also other CLMA errors because it is also used as sampling clock. Abnormality of the LOCO may cause not only CLMA5 but also other CLMA errors.

- In case of higher frequency than expectation, the product may not work correctly due to outside of the operation range.
- Glitch may be generated when switching to the alternative clock in case main oscillator clock frequency is lower than one-eight of the LOCO frequency.
- In case monitoring clock stops instantly, abnormality may not be detected.
- The clock is switched to the alternative clock when the clock abnormality is detected as below table.

CLMAm error			Alternative clock			
CLMA6 (MOSC) error	CLMA5 (LOCO) error	CLMAn (PLLn) error (n = 0 to 4)	MOSC clock	PLLn output clock	Other PLL than PLLn output clock	Description
0	0	0	MOSC	PLLn	Other PLL than PLLn	Normal operation
1	0	X	LOCO	LOCO or PLLn	LOCO or Other PLL than PLLn	MOSC error*1 *2 *3
0	1	0	MOSC	PLLn	Other PLL than PLLn	LOCO error
1	1	X	LOCO	LOCO or PLLn	LOCO or Other PLL than PLLn	Either MOSC or LOCO error*1 *2 *3
0	0	1	MOSC	MOSC	Other PLL than PLLn	PLLn error
Other than the above			Indefinite			Indefinite

Note: MOSC is main clock oscillator. It is assumed that all CLMAm are enabled.
Note 1. Set LOCOCR.LCSTP to 1 when the clock is switched to LOCO in case of detecting abnormality since LOCO is stopped at the reset value. Be careful that if the reset is asserted after switching to the LOCO, this LSI may not restart because LOCO is disabled at the reset value in case clock abnormality originates from the hard error.
Note 2. PLL output clocks are selected by SCKCR.CLMASEL.
Note 3. When PLL is selected as alternative clock, PLL output clock is free run and the clock frequency is not guaranteed.

9. Low-Power Consumption Function

9.1 Overview

This LSI has several functions for reducing power consumption, including the Cortex®-A55 and Cortex®-R52 standby function and the module-stop function that stops functions independently for each peripheral module. Power consumption using clock control such as CKIO output control is also possible.

Table 9.1 lists the specifications of low-power consumption functions. Table 9.2 describes how to stop each peripheral module and exit the stop state.

Table 9.1 Specifications of low-power consumption function

Parameter	Specifications
Low-power consumption mode	Standby mode (Cortex-A55 and Cortex-R52)
Module-stop function	Functions can be stopped independently for each peripheral module
CKIO output control function	CKIO clock output or stop (held at the low level) can be selected

Table 9.2 Stopping peripheral modules and exiting module-stop state (1 of 2)

Module	How to stop operation and exit the stop state	Initial state*1
Cortex-A55 Cortex-R52	Standby mode condition: Execution of the Wait For Interrupt (WFI) instruction Condition for release from the Standby mode: interrupt Additionally, set the control register to enter or exit the module-stop state.	Second boot CPU: Operating Other CPU: Stop
Internal bus	Always operating	Operating
Tightly coupled memory (ATCM or BTCM)	Operate only during access	Operate only during access
System SRAM (SYSRAM)	Operate only during access	Operate only during access
Interrupt controller unit (ICU)	Operation is always enabled	Operating
Bus state controller (BSC)	Set the control register to enter or exit the module-stop state	Stop
Direct memory access controller (DMAC)	Operation is always enabled	Operating
General-purpose I/O ports	Operation is always enabled	Operating
Event link controller (ELC)	Operation is always enabled	Operating
Multi-function timer pulse unit 3 (MTU3)	Set the control register to enter or exit the module-stop state	Stop
General PWM timer (GPT)	Set the control register to enter or exit the module-stop state	Stop
Compare match timer (CMT)	Set the control register to enter or exit the module-stop state	Stop
Compare match timer W (CMTW)	Set the control register to enter or exit the module-stop state	Stop
Watchdog timer (WDT)	Operation is always enabled	Operating
Port output enable 3 (POE3)	Operation is always enabled	Operating
Port output enable for GPT (POEG)	Operation is always enabled	Operating
Real time clock (RTC)	Set the control register to enter or exit the module-stop state	Stop
Ethernet MAC (GMAC)	Set the control register to stop the module or exit the module-stop state	Stop
Ethernet switch (ETHSW)	Set the control register to stop the module or exit the module-stop state	Stop
EtherCAT slave controller (ESC)	Set the control register to stop the module or exit the module-stop state	Stop

Table 9.2 Stopping peripheral modules and exiting module-stop state (2 of 2)

Module	How to stop operation and exit the stop state	Initial state*1
USB 2.0 HS host/function module	Set the control register to stop the module or exit the module-stop state	Stop*2
Serial communication interface (SCI)	Set the control register to enter or exit the module-stop state	Stop*2
I2C bus interface (IIC)	Set the control register to enter or exit the module-stop state	Stop
CANFD interface (CANFD)	Set the control register to enter or exit the module-stop state	Stop
Serial peripheral interface (SPI)	Set the control register to enter or exit the module-stop state	Stop
Expanded serial peripheral interface (xSPI)	Set the control register to enter or exit the module-stop state	Stop*2
ΔΣ interface (DSMIF)	Set the control register to enter or exit the module-stop state	Stop
Trigonometric function unit (TFU)	Set the control register to enter or exit the module-stop state	Stop
12-bit A/D converter (ADC12)	Set the control register to enter or exit the module-stop state	Stop
Temperature sensor unit (TSU)	Set the control register to enter or exit the module-stop state	Stop
CRC operation unit (CRC)	Set the control register to enter or exit the module-stop state	Stop
Clock monitor circuit (CLMA)	Set the control register to enter or exit the module-stop state	Stop
Data operation circuit (DOC)	Set the control register to enter or exit the module-stop state	Stop
Serial host interface (SHOSTIF)	Set the control register to enter or exit the module-stop state	Stop
EnDat 2.2 (ENDAT)	Set the control register to enter or exit the module-stop state	Stop
BiSS-C (BISS)	Set the control register to enter or exit the module-stop state	Stop
HIPERFACE DSL (HDSL)	Set the control register to enter or exit the module-stop state	Stop
A-format (AFMT)	Set the control register to enter or exit the module-stop state	Stop
ENCOUT	Set the control register to enter or exit the module-stop state	Stop
LCD Controller (LCDC)	Set the control register to enter or exit the module-stop state	Stop
SD/eMMC Host controller (SD)	Set the control register to enter or exit the module-stop state	Stop*2
PCI Express Gen3 (PCIE)	Set the control register to enter or exit the module-stop state	Stop
LPDDR4 SDRAM Subsystem (DDRSS)	Set the control register to enter or exit the module-stop state	Stop

Note 1. Each module is returned to the initial state by means of the RES# pin reset, error reset, or system software reset.
Note 2. The state of the module is Operating if its boot mode is selected.

9.3 Register Descriptions

The registers are applicable to the register write protection function. To write to the registers, specify bit 1 or 3 of the Protect Register (PRCRN and PRCRS) to cancel the write protection. For details, see section 11, Register Write Protection Function.

9.3.1 MSTPCRA : Module Stop Control Register A

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x0300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	MSTPCRA27	MSTPCRA26	MSTPCRA25	MSTPCRA24	MSTPCRA23	MSTPCRA22	MSTPCRA21	MSTPCRA20	MSTPCRA19	MSTPCRA18	MSTPCRA17	MSTPCRA16
Value after reset:	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MSTPCRA12	MSTPCRA11	MSTPCRA10	MSTPCRA09	MSTPCRA08	—	—	MSTPCRA05	MSTPCRA04	—	—	—	MSTPCRA00
Value after reset:	0	0	0	1	1	1	1	1*1	0	0	1*1	1*1	0	0	0	1

Bit	Symbol	Function	R/W
0	MSTPCRA00	BSC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	MSTPCRA04	xSPI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRA05	xSPI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	MSTPCRA08	SCI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRA09	SCI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRA10	SCI Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
11	MSTPCRA11	SCI Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Function	R/W
12	MSTPCRA12	SCI Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
16	MSTPCRA16	SCIE Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
17	MSTPCRA17	SCIE Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
18	MSTPCRA18	SCIE Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
19	MSTPCRA19	SCIE Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
20	MSTPCRA20	SCIE Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
21	MSTPCRA21	SCIE Unit 5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
22	MSTPCRA22	SCIE Unit 6 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
23	MSTPCRA23	SCIE Unit 7 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
24	MSTPCRA24	SCIE Unit 8 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
25	MSTPCRA25	SCIE Unit 9 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
26	MSTPCRA26	SCIE Unit 10 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
27	MSTPCRA27	SCIE Unit 11 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value changes depending on the operation mode setting.

The MSTPCRA register controls the module-stop state. This register is available in Non Safety region.

9.3.2 MSTPCRB : Module Stop Control Register B

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x0304

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	MSTPCRB06	MSTPCRB05	MSTPCRB04	—	—	MSTPCRB01	MSTPCRB00
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
0	MSTPCRB00	IIC Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRB01	IIC Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	MSTPCRB04	SPI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRB05	SPI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRB06	SPI Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRB register controls the module-stop state. This register is available in Non Safety region.

9.3.3 MSTPCRC : Module Stop Control Register C

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x308

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	MSTPCRC25	MSTPCRC24	MSTPCRC23	MSTPCRC22	MSTPCRC21	MSTPCRC20	MSTPCRC19	MSTPCRC18	MSTPCRC17	MSTPCRC16
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MSTPCRC07	MSTPCRC06	MSTPCRC05	—	—	MSTPCRC02	MSTPCRC01	MSTPCRC00
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	0	0	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRC00	MTU3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRC01	GPT Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRC02	GPT Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	MSTPCRC05	TFU Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRC06	ADC12 Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7	MSTPCRC07	ADC12 Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
16	MSTPCRC16	GPT Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
17	MSTPCRC17	GPT Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
18	MSTPCRC18	GPT Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
19	MSTPCRC19	GPT Unit 5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
20	MSTPCRC20	GPT Unit 6 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
21	MSTPCRC21	GPT Unit 7 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
22	MSTPCRC22	GPT Unit 8 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
23	MSTPCRC23	GPT Unit 9 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
24	MSTPCRC24	TFU Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
25	MSTPCRC25	ADC12 Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRC register controls the module-stop state. This register is available in Non Safety region.

9.3.4 MSTPCRD : Module Stop Control Register D

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x30C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	MSTPCRD23	MSTPCRD22	MSTPCRD21	MSTPCRD20	MSTPCRD19	MSTPCRD18	MSTPCRD17	MSTPCRD16
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTPCRD11	MSTPCRD10	MSTPCRD09	MSTPCRD08	MSTPCRD07	MSTPCRD06	MSTPCRD05	MSTPCRD04	MSTPCRD03	MSTPCRD02	MSTPCRD01	MSTPCRD00
Value after reset:	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRD00	DSMIF Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRD01	DSMIF Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRD02	CMT Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRD03	CMT Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4	MSTPCRD04	CMT Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRD05	CMTW Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRD06	CMTW Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7	MSTPCRD07	TSU Module Stop 0: Release from the module-stop state 1: Transition to the module stop state is made	R/W
8	MSTPCRD08	DOC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRD09	CRC Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRD10	CANFD Module Stop 0: Release from the module-stop state 1: Transition to the module stop state is made	R/W
11	MSTPCRD11	CKIO Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
16	MSTPCRD16	DSMIF Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
17	MSTPCRD17	DSMIF Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
18	MSTPCRD18	DSMIF Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
19	MSTPCRD19	DSMIF Unit 5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
20	MSTPCRD20	DSMIF Unit 6 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
21	MSTPCRD21	DSMIF Unit 7 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
22	MSTPCRD22	DSMIF Unit 8 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
23	MSTPCRD23	DSMIF Unit 9 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRD register controls the module-stop state. This register is available in Non Safety region.

9.3.5 MSTPCRE : Module Stop Control Register E

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x310

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRE17	MSTPCRE16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MSTPCRE08	—	—	—	—	MSTPCRE03	MSTPCRE02	MSTPCRE01	MSTPCRE00
Value after reset:	0	0	0	0	0	0	0	1*1	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRE00	GMAC Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRE01	ETHSW Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRE02	ESC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Function	R/W
3	MSTPCRE03	Ethernet Subsystem Register Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	MSTPCRE08	USB Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	MSTPCRE16	GMAC Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
17	MSTPCRE17	GMAC Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value changes depending on the operation mode setting.

The MSTPCRE register controls the module-stop state. This register is available in Non Safety region.

9.3.6 MSTPCRG : Module Stop Control Register G

Base address: SYSC_S = 0x8128_0000

Offset address: 0x318

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTPCRG14	MSTPCRG13	MSTPCRG12	MSTPCRG11	MSTPCRG10	MSTPCRG09	MSTPCRG08	—	—	MSTPCRG05	MSTPCRG04	MSTPCRG03	MSTPCRG02	MSTPCRG01	MSTPCRG00
Value after reset:	0	1	1	1	1	1	1	1	0	0	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRG00	SCI Unit 5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRG01	IIC Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRG02	SPI Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRG03	GPT Unit 10 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4	MSTPCRG04	CRC Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRG05	RTC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	MSTPCRG08	CLMA6 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRG09	CLMA0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRG10	CLMA1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
11	MSTPCRG11	CLMA2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
12	MSTPCRG12	CLMA3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
13	MSTPCRG13	CLMA4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
14	MSTPCRG14	CLMA5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:15	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRG register controls the module-stop state. This register is available in Safety region.

9.3.7 MSTPCRI : Module Stop Control Register I

Base address: SYSC_S = 0x8128_0000

Offset address: 0x320

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRI01	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	MSTPCRI01	SHOSTIF Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRI register controls the module-stop state. This register is available in Safety region.

9.3.8 MSTPCRJ : Module Stop Control Register J

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x324

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTPCRJ31	MSTPCRJ30	MSTPCRJ29	MSTPCRJ28	MSTPCRJ27	MSTPCRJ26	MSTPCRJ25	MSTPCRJ24	MSTPCRJ23	MSTPCRJ22	MSTPCRJ21	MSTPCRJ20	MSTPCRJ19	MSTPCRJ18	MSTPCRJ17	MSTPCRJ16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSTPCRJ15	MSTPCRJ14	MSTPCRJ13	MSTPCRJ12	MSTPCRJ11	MSTPCRJ10	MSTPCRJ09	MSTPCRJ08	MSTPCRJ07	MSTPCRJ06	MSTPCRJ05	MSTPCRJ04	MSTPCRJ03	MSTPCRJ02	MSTPCRJ01	MSTPCRJ00
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRJ00	AFMT Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRJ01	HDSL Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRJ02	BISS Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRJ03	ENDAT Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4	MSTPCRJ04	AFMT Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRJ05	HDSL Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRJ06	BISS Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7	MSTPCRJ07	ENDAT Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
8	MSTPCRJ08	AFMT Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRJ09	HDSL Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRJ10	BISS Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
11	MSTPCRJ11	ENDAT Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
12	MSTPCRJ12	AFMT Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Function	R/W
13	MSTPCRJ13	HDSL Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
14	MSTPCRJ14	BISS Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
15	MSTPCRJ15	ENDAT Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
16	MSTPCRJ16	AFMT Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
17	MSTPCRJ17	HDSL Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

3	MSTPCRN03	Cortex-A55 Core1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4	MSTPCRN04	Cortex-A55 Core2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Function	R/W
5	MSTPCRN05	Cortex-A55 Core3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value changes depending on the operation mode setting.

The MSTPCRN register controls the module-stop state. This register is available in Safety region.

9.4 Operation

9.4.1 Module-Stop Function

The module-stop function can stop operation of each module of on-chip peripheral functions. When the MSTPCRmi bit (m = A to N, i = 31 to 00) in the MSTPCRA to MSTPCRN registers is set to 1, the specified module stops operating and enters the module-stop state. Clearing the MSTPCRmi bit (m = A to N, i = 31 to 00) to 0 leads to release from the module-stop state. Follow the procedure given below when releasing any of the peripheral modules listed in Table 9.5 from the module-stop state. This procedure is not required for peripheral modules not listed in Table 9.5. However, release from the module-stop state should be in accord with the procedure for initialization described in the section for the given peripheral module.

Note that in case of AXI-type slave module, the access to the slave I/F needs to be stopped by slave stop function before changing module stop state. For details, see section 13.4.3. Slave Stop Function.

(1) Procedure

1. Clear the corresponding bit in the relevant Module Stop Control Register (MSTPCRm, m = A to N) then immediately dummy-read the MSTPCRm register once.
2. Dummy-read any register of the peripheral module which is being released from the module-stop state at least 7 times except RTC and LCDC. For RTC, at least 300 times and for LCDC, at least 100 times. After that, all registers of that peripheral module can be accessible.

Note: The MPU having set the access control attribute for the peripheral I/O register region to 'Device nGnRnE' or 'Device nGnRE' is a prerequisite for the procedure.

(2) Example code

```
volatile unsigned long dummy;           // Declared volatile to prevent optimization being applied

R_SYSC_NS->MSTPCRD_b.MSTPCRD06 = 0;     // Setting to release CMTW unit 1 from the module-stop state
dummy = R_SYSC_NS->MSTPCRD;             // Step 1: Dummy-read the MSTPCRm register.

dummy = R_CMTW1->CMWCOR;                // Step 2: Dummy-read any register of CMTW unit 1 at least 7 times.
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
R_CMTW1->CMWIOR = 0x0001U;              // The first setting for CMTW unit 1 (value is an example)
```

For details about the initial state after a release from the reset state, see Table 9.2.

Note: Directly after a module is set to the module-stop state, writing to the control register of that module might still be possible.

Table 9.5 Peripheral functions requiring the above procedure for release from the module-stop state (1 of 3)

Peripheral functions	Corresponding Module-Stop Control Register
BSC	MSTPCRA register, MSTPCRA00 bit
xSPI Unit 0, 1*1	MSTPCRA register, MSTPCRA04, MSTPCRA05 bit

Table 9.5 Peripheral functions requiring the above procedure for release from the module-stop state (2 of 3)

Peripheral functions	Corresponding Module-Stop Control Register
SCI Unit 0 to 4	MSTPCRA register, MSTPCRA08 to MSTPCRA12 bit

SHOSTIF	MSTPCRI register, MSTPCRI01 bit
AFMT Unit 0 to 7	MSTPCRJ register, MSTPCRJ00, MSTPCRJ04, MSTPCRJ08, MSTPCRJ12, MSTPCRJ16, MSTPCRJ20, MSTPCRJ24, MSTPCRJ28 bit
AFMT Unit 8 to 15	MSTPCRK register, MSTPCRK00, MSTPCRK04, MSTPCRK08, MSTPCRK12, MSTPCRK16, MSTPCRK20, MSTPCRK24, MSTPCRK28 bit
HDSL Unit 0 to 7	MSTPCRJ register, MSTPCRJ01, MSTPCRJ05, MSTPCRJ09, MSTPCRJ13, MSTPCRJ17, MSTPCRJ21, MSTPCRJ25, MSTPCRJ29 bit
HDSL Unit 8 to 15	MSTPCRK register, MSTPCRK01, MSTPCRK05, MSTPCRK09, MSTPCRK13, MSTPCRK17, MSTPCRK21, MSTPCRK25, MSTPCRK29 bit
BISC Unit 0 to 7	MSTPCRJ register, MSTPCRJ02, MSTPCRJ06, MSTPCRJ10, MSTPCRJ14, MSTPCRJ18, MSTPCRJ22, MSTPCRJ26, MSTPCRJ30 bit
BISS Unit 8 to 15	MSTPCRK register, MSTPCRK02, MSTPCRK06, MSTPCRK10, MSTPCRK14, MSTPCRK18, MSTPCRK22, MSTPCRK26, MSTPCRK30 bit
ENDAT Unit 0 to 7	MSTPCRJ register, MSTPCRJ03, MSTPCRJ07, MSTPCRJ11, MSTPCRJ15, MSTPCRJ19, MSTPCRJ23, MSTPCRJ27, MSTPCRJ31 bit
ENDAT Unit 8 to 15	MSTPCRK register, MSTPCRK03, MSTPCRK07, MSTPCRK11, MSTPCRK15, MSTPCRK19, MSTPCRK23, MSTPCRK27, MSTPCRK31 bit

Table 9.5 Peripheral functions requiring the above procedure for release from the module-stop state (3 of 3)

Peripheral functions	Corresponding Module-Stop Control Register
ENCOUT	MSTPCRL register, MSTPCRL00 bit
DDRSS*1	MSTPCRM register, MSTPCRM00 bit
LCDC	MSTPCRM register, MSTPCRM04 bit
PCIE*1	MSTPCRM register, MSTPCRM08 bit
SDHI Unit 0, 1*1	MSTPCRM register, MSTPCRM12, MSTPCRM13 bit
Cortex-R52 CPU0*1	MSTPCRN register, MSTPCRN00 bit
Cortex-R52 CPU1*1	MSTPCRN register, MSTPCRN01 bit
Cortex-A55 Core0 to Core3	MSTPCRN register, MSTPCRN02 to MSTPCRN05 bit

Note 1. Operation of the slave stop function is needed together. For details, see section 13.4.3. Slave Stop Function.

9.4.2 Cortex-A55/Cortex-R52 Standby Mode

9.4.2.1 Transition to Cortex-A55/Cortex-R52 Standby Mode

The Cortex-A55/Cortex-R52 enters Standby mode by execution of a WFI instruction. In Standby mode, the Cortex-A55/Cortex-R52 stops operating, thus reducing power consumption. For details, see the technical reference manual provided by Arm.

9.4.2.2 Release from Cortex-A55/Cortex-R52 Standby Mode

Release from the Cortex-A55/Cortex-R52 Standby mode is initiated by any interrupt, the RES# pin reset, an error reset, system software reset, or CPU software reset.

(1) Release triggered by an interrupt signal

Generation of an interrupt in a CPU triggers release from Standby mode or Sleep mode of the CPU and the interrupt exception handling starts. Release is triggered by a non-maskable interrupt or a maskable interrupt of which interrupt request is permitted by using the Interrupt Enable register.

(2) Release by a reset

After the RES# pin reset, error reset, or system software reset is cleared, the Cortex-R52 CPU0 starts the reset exception handling but the other CPUs are still in the reset state. After CPU software reset of target CPU is cleared and corresponding bit in MSTPCRN register is cleared, the corresponding CPU starts the reset exception handling. For details about resets, see section 6, Reset.

9.5 Usage Notes

9.5.1 I/O Port State

To reduce I/O power consumption, pin processing based on I/O control is required. For details, see section 17, I/O Ports.

9.5.2 On-Chip Peripheral Module Interrupts in Module-Stop State

Peripheral modules cannot interrupt in a module-stop state. Therefore, if the module-stop state is set during interrupt processing of the module or during DMA transfer by the DMAC, a CPU interrupt source or a DMAC startup source cannot be cleared. For this reason, disable the relevant interrupts before setting the module-stop state.

9.5.3 USB Low Power Consumption

For details about how to clear the USB module-stop state and how to enter the USB in low-power consumption mode, see section 31, USB 2.0 Host Module (USBHC) and section 32, USB 2.0 HS Function Module (USBf).

9.5.4 Low Power Consumption for Ethernet-Related Functions

Ethernet-related functions are stopped and reset in the initial state. To use the functions, specify the MSTPCRE.MSTPCRE00 to MSTPCRE03 bits for release from the module-stop state. After the dummy read, specify the MRCTLE.MRCTLE00 to MRCTLE06 bits for release from reset state.

Note: After release from the module-stop state, the module-stop state cannot be set again. Operation is not guaranteed after release from the module-stop state is initiated the second time. After the modules are returned to the initial state (stop state) by a reset, they can be released from the module-stop state again.

9.5.5 Write Protection Function

The Module Stop Control registers (MSTPCRA to MSTPCRN) can be write-protected. To write to the MSTPCRA to MSTPCRN registers, specify bit 1 of the Protect Register (PRCRN for MSTPCRA to MSTPCRE and MSTPCRJ to MSTPCRM, and PRCRS for MSTPCRG, MSTPCRI, and MSTPCRN) to unlock the write protection. For details, see section 11, Register Write Protection Function.

9.5.6 Transition to Cortex-A55/Cortex-R52 Module-Stop State

When transiting Cortex-A55/Cortex-R52 to module-stop state, follow the below procedure.

In case of Cortex-A55 Cluster including all cores:

1. Set 0x00000000 to SWR55ARC register.
2. Issue WFI instruction from all CA55 cores.
3. Set 0x4321A501 to SWR55C register from other CPU.
4. Set 0xF to MSTPCRN.MSTPCRN0i (i = 2 to 5) from other CPU.

Note that transition to module-stop state each CA55 core only is not supported. Use Standby Mode transited by WFI instruction only instead.

In case of Cortex-R52 CPUn (n = 0 or 1):

1. Issue WFI instruction from Cortex-R52 CPUn.
2. Set 0x4321A501 to SWRCPUn register from other CPU.
3. Set 1 to MSTPCRN.MSTPCRN0n from other CPU.

Note that for CPU0, code in TCM can't be changed until releasing module-stop and starting fetch again. That means CPU0 starts from code stored before transition to module-stop.

For CPU1, code in TCM can be changed before starting fetch again via AXIS. Please see section 3.6.2. How to Start Up Cortex-R52 CPU1.

10. Debugging Interface

The LSI has an internal debugging interface that adopts an architecture in which Cortex-A55 quad cores and two Cortex-R52 are integrated by CoreSight. This LSI supports debugging functions, such as downloading, running, and breaking a program, and trace function, which outputs execution history of programs.

10.1 Overview

The LSI supports JTAG and SWD interfaces for debugging and ETR interface for trace.

The LSI has TAP controllers for boundary scan and for CoreSight debugging, which can be selected by the input level of the BSCANP pin. To use the debugging function, set the input level of the BSCANP pin to low. For details on boundary scan, see section 39, Boundary Scan.

Table 10.1 lists the specifications of CoreSight and Figure 10.1 shows a block diagram of CoreSight. For details on CoreSight, see the *Arm Technical Reference Manual*.

Table 10.1 CoreSight specifications

Parameter	Description
Debugging function	• JTAG interface • SWD (Serial Wire Debug) interface
Trace function	• ETF (Embedded Trace FIFO): 16 KB for CA55 funnel, 16 KB for two CR52 funnel and 8 KB for last funnel • ETR (Embedded Trace Router)

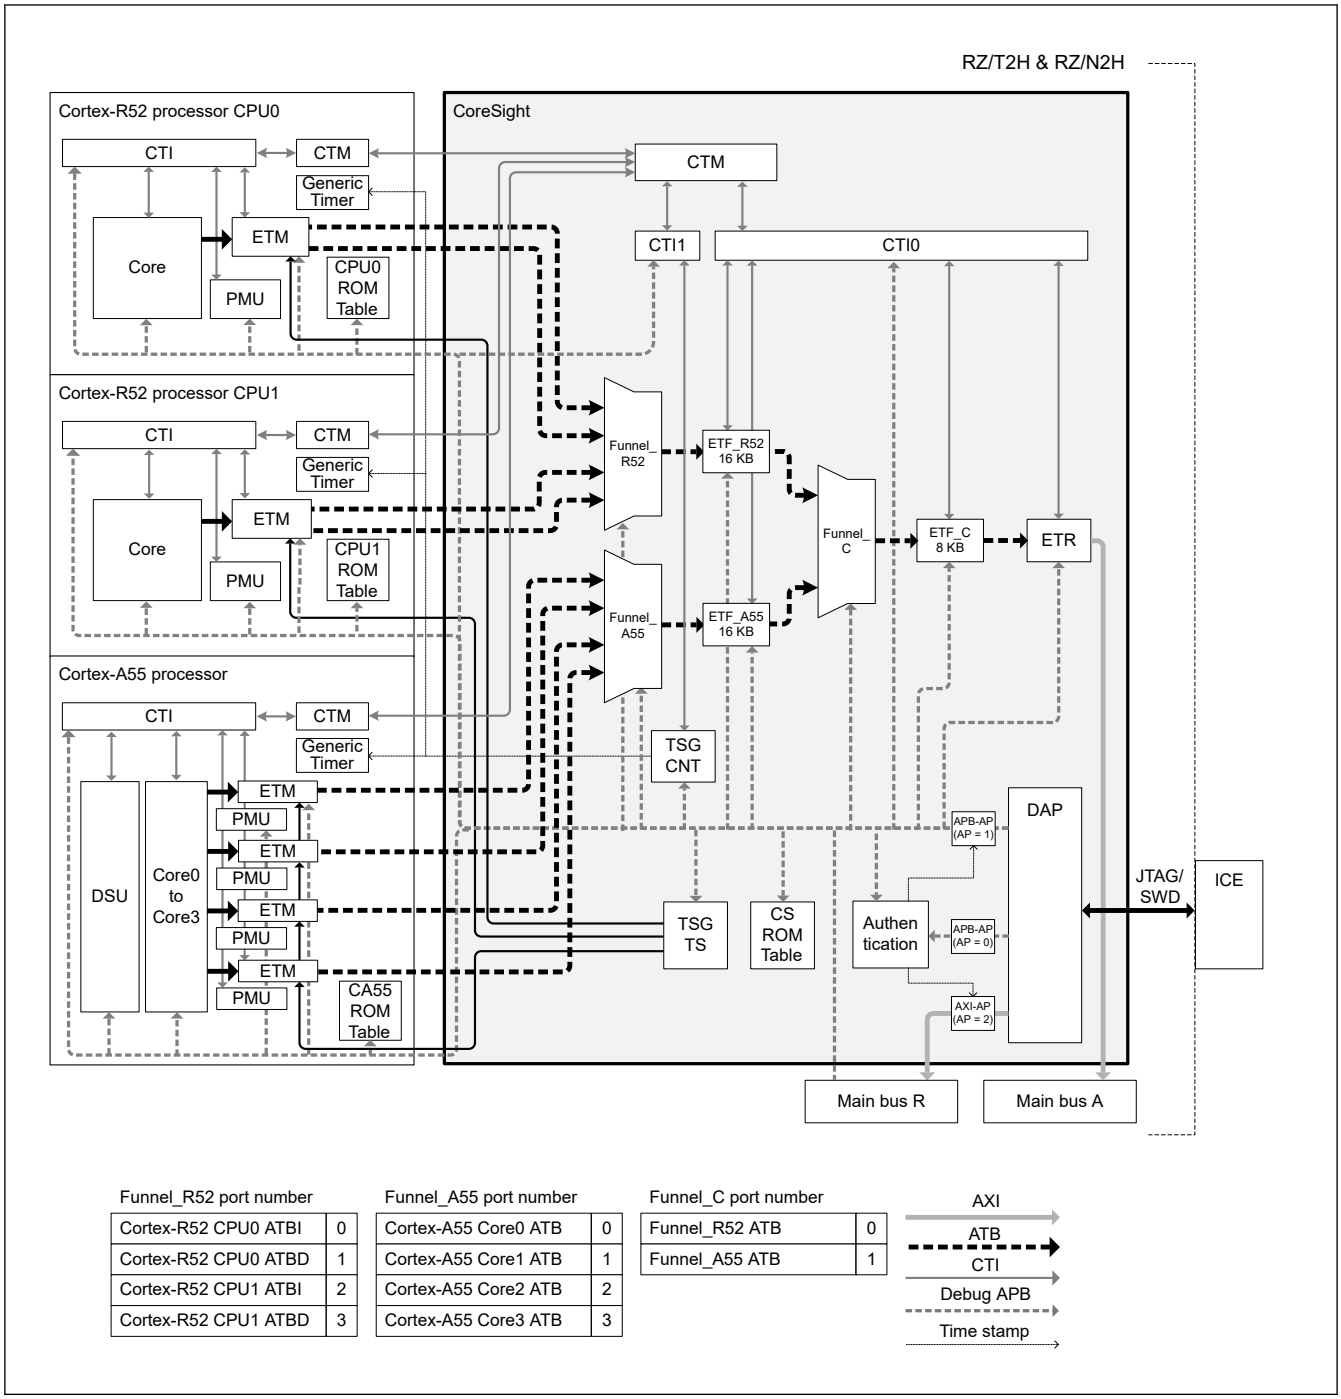

Figure 10.1 CoreSight block diagram

Table 10.2 and Table 10.3 list the input and output for the CTI trigger of CoreSight.

Table 10.2 CTI trigger input and output (CoreSight CTI0) (1 of 2)

CTI input	Description	CTI output	Description
0	ETF_R52 ACQCOMP	0	ETF_R52 FLUSHIN
1	ETF_R52 FULL	1	ETF_R52 TRIGIN
2	ETF_A55 ACQCOMP	2	ETF_A55 FLUSHIN
3	ETF_A55 FULL	3	ETF_A55 TRIGIN
4	ETF_C ACQCOMP	4	ETF_C FLUSHIN
5	ETF_C FULL	5	ETF_C TRIGIN

Table 10.2 CTI trigger input and output (CoreSight CTI0) (2 of 2)

CTI input	Description	CTI output	Description
6	ETR ACQCOMP	6	ETR FLUSHIN
7	ETR FULL	7	ETR TRIGIN

0x8C44_0000 to 0x8C44_FFFF	0x8044_0000 to 0x8044_FFFF	Cortex-R52 CPU0/ETM
0x8C80_0000 to 0x8C80_FFFF	0x8080_0000 to 0x8080_FFFF	Cortex-R52 CPU1/ROM Table
0x8C81_0000 to 0x8C81_FFFF	0x8081_0000 to 0x8081_FFFF	Cortex-R52 CPU1/Debug
0x8C82_0000 to 0x8C82_FFFF	0x8082_0000 to 0x8082_FFFF	Cortex-R52 CPU1/CTI
0x8C83_0000 to 0x8C83_FFFF	0x8083_0000 to 0x8083_FFFF	Cortex-R52 CPU1/PMU
0x8C84_0000 to 0x8C84_FFFF	0x8084_0000 to 0x8084_FFFF	Cortex-R52 CPU1/ETM
0x8CC0_0000 to 0x8CC0_FFFF	0x80C0_0000 to 0x80C0_FFFF	Cortex-A55/ROM Table
0x8CC1_0000 to 0x8CC1_FFFF	0x80C1_0000 to 0x80C1_FFFF	Cortex-A55 Core0/Debug
0x8CC2_0000 to 0x8CC2_FFFF	0x80C2_0000 to 0x80C2_FFFF	Cortex-A55 Core0/CTI
0x8CC3_0000 to 0x8CC3_FFFF	0x80C3_0000 to 0x80C3_FFFF	Cortex-A55 Core0/PMU
0x8CC4_0000 to 0x8CC4_FFFF	0x80C4_0000 to 0x80C4_FFFF	Cortex-A55 Core0/ETM
0x8CD1_0000 to 0x8CD1_FFFF	0x80D1_0000 to 0x80D1_FFFF	Cortex-A55 Core1/Debug
0x8CD2_0000 to 0x8CD2_FFFF	0x80D2_0000 to 0x80D2_FFFF	Cortex-A55 Core1/CTI
0x8CD3_0000 to 0x8CD3_FFFF	0x80D3_0000 to 0x80D3_FFFF	Cortex-A55 Core1/PMU
0x8CD4_0000 to 0x8CD4_FFFF	0x80D4_0000 to 0x80D4_FFFF	Cortex-A55 Core1/ETM
0x8CE1_0000 to 0x8CE1_FFFF	0x80E1_0000 to 0x80E1_FFFF	Cortex-A55 Core2/Debug
0x8CE2_0000 to 0x8CE2_FFFF	0x80E2_0000 to 0x80E2_FFFF	Cortex-A55 Core2/CTI
0x8CE3_0000 to 0x8CE3_FFFF	0x80E3_0000 to 0x80E3_FFFF	Cortex-A55 Core2/PMU
0x8CE4_0000 to 0x8CE4_FFFF	0x80E4_0000 to 0x80E4_FFFF	Cortex-A55 Core2/ETM
0x8CF1_0000 to 0x8CF1_FFFF	0x80F1_0000 to 0x80F1_FFFF	Cortex-A55 Core3/Debug
0x8CF2_0000 to 0x8CF2_FFFF	0x80F2_0000 to 0x80F2_FFFF	Cortex-A55 Core3/CTI
0x8CF3_0000 to 0x8CF3_FFFF	0x80F3_0000 to 0x80F3_FFFF	Cortex-A55 Core3/PMU
0x8CF4_0000 to 0x8CF4_FFFF	0x80F4_0000 to 0x80F4_FFFF	Cortex-A55 Core3/ETM

Note: No listed areas are reserved. Do not access those areas.

Table 10.7 CoreSight related system control register

Target	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
All registers from internal CPU access	—	—	SLVACCCTL7.CSDBGAPB_SL

Table 10.8 lists the input/output pins of the debugging interface.

Table 10.8 Configuration of pins for the debugging interface

Name	Pin name	I/O	Functions
Test clock	TCK	Input	Data is serially supplied from the Test Data Input (TDI) pin to this module, synchronized with this clock, and output from the Test Data Output (TDO) pin. In SWD mode, this pin functions as the SWCLK pin. This pin can also be used as a general-purpose port. The initial function is TCK.
Test mode select	TMS	Input/ Output	Changing the level of this signal, by synchronizing with TCK, determines the status of the TAP (Test Access Port) control circuit. The protocol conforms to the JTAG standard (IEEE Std.1149.1). In SWD mode, this pin functions as the SWDIO pin. This pin can also be used as a general-purpose port. The initial function is TMS.
Test reset	TRST#	Input	This pin accepts input asynchronously with TCK. When the level of this pin is low, TAP (Test Access Port) is reset. When the levels of the TRST# pin and RES# pin are both low, TAP and the debugging circuit are reset.
Test data input	TDI	Input	Changing the level of this pin, by synchronizing with TCK, sends data to this module. This pin can also be used as a general-purpose port. The initial function is TDI.
Test data output	TDO	Output	Reading the level of this pin, by synchronizing with TCK, reads data from this module. This pin can also be used as a general-purpose port. The initial function is TDO.
Boundary scan setting	BSCANP	Input	Input the high level when boundary scan test is performed. Input low when debugging is performed by CoreSight. For details on boundary scan, see section 39, Boundary Scan.

Note: When you design a board on which an emulator can be used, set the TRST# pin to low while the RES# pin is asserted at power up, and configure the board so that control is available by the TRST# pin only. When this pin is not used, fix it to low, or connect it so that the same signal as that on the RES# pin is to be input. For details, see section 10.3.3. Reset Configuration and the Method of Connecting with the Emulator.

10.2 Register Descriptions

10.2.1 OIRn : OCD Authentication ID Code Register n (n = 0 to 3)

Address: 0x0008_0000 + 0x04 × n (the address is the debugger view (AP = 0))

Bit position:	31																												0
Bit field:	IDn[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	IDn[31:0]	128-bit Authentication ID n = 0: Authentication ID[31:0] n = 1: Authentication ID[63:32] n = 2: Authentication ID[95:64] n = 3: Authentication ID[127:96]	W*1

Note 1. Once all four registers are written, further write is blocked.

The OIRn registers are used to write 128-bit authentication ID from the external debugger to access debug system.

10.2.2 OSR : OCD Status Register

Address: 0x0008_0010 (the address is the debugger view (AP = 0))

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WFLG	RESULT[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	RESULT[1:0]	Authentication result 0 0: No authentication 0 1: Passed Authentication level 1. Both EL2 and EL1/EL0 accesses are permitted. 1 0: Passed Authentication level 2. Only EL1/EL0 access is permitted. 1 1: Failed or access permanently prohibited	R
2	WFLG	All OIRn registers written flag 0: Not written 1: Written	R
31:3	—	These bits are read as 0.	R

The OSR register indicates authentication result.

10.3 Operation

10.3.1 JTAG Interface

The JTAG interface uses five signals (TCK, TMS, TDO, TDI, and TRST#) to communicate with the host machine (PC) through the emulator. Figure 10.2 shows an example connection, which includes the RES# pin connection.

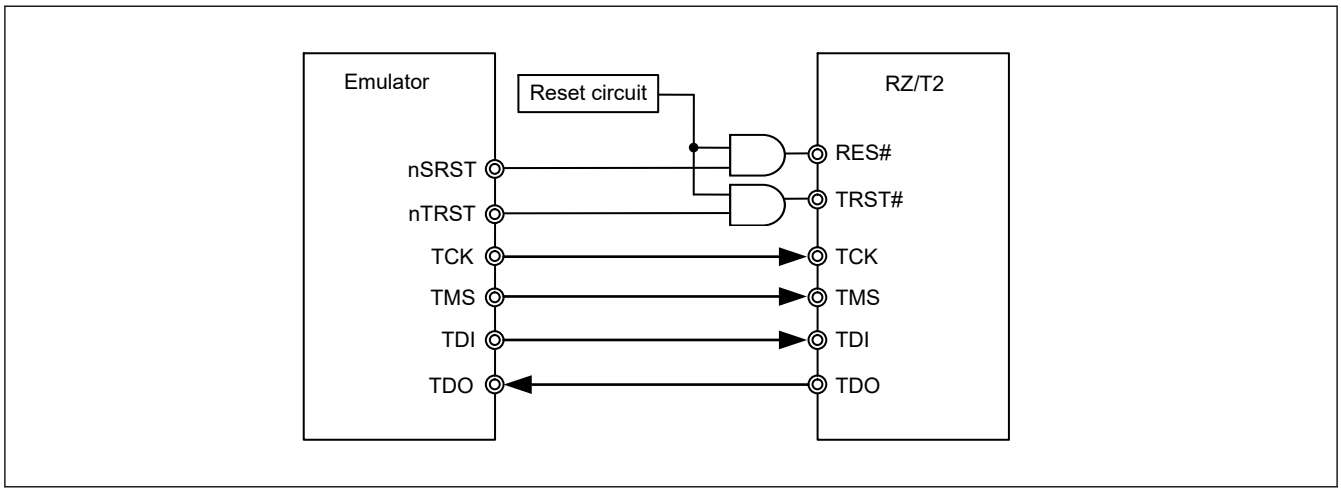

Figure 10.2 Example connection of the JTAG interface

When the JTAG interface is not used, the TCK, TMS, TDI, and TDO pins can be used as general-purpose ports. When you use these pins as general-purpose ports, perform pin settings by referring to section 17, I/O Ports.

10.3.2 SWD Interface

The SWD (Serial Wire Debug) interface uses two signals (SWCLK (TCK) and SWDIO (TMS)) to communicate with the host machine (PC) through the emulator. Figure 10.3 shows an example connection, which includes the RES# pin connection.

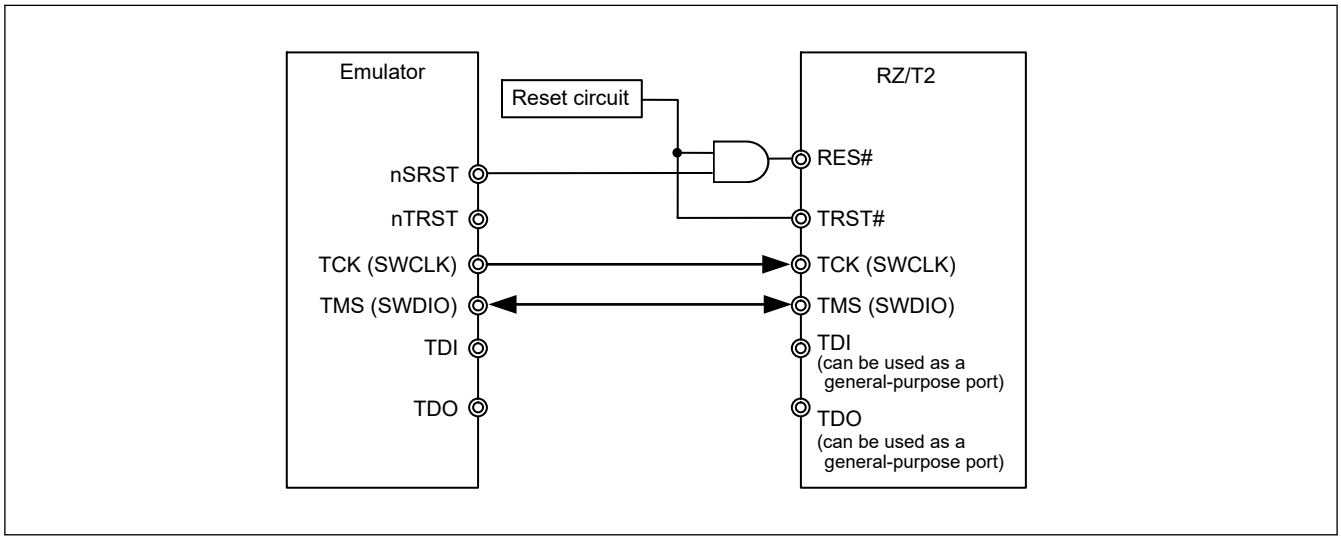

Figure 10.3 Example connection of the SWD interface

When the SWD interface is used for debugging, the TDI and TDO pins can be used as general-purpose ports. When using these pins as general-purpose ports, perform pin settings by referring to section 17, I/O Ports.

Note: In the initial status of the LSI, the debugging interface is in JTAG mode. If you use the TDI and TDO pins as general-purpose ports and the emulator connection for debugging, switch the mode to SWD (Serial Wire Debug) mode using the control from the debugger, and then start debugging.

10.3.3 Reset Configuration and the Method of Connecting with the Emulator

When designing a board on which the emulator can be used, set the TRST# pin to low while the RES# pin is asserted at power up. Also, configure the board so that control is available by the TRST# pin only.

When debugging is performed, if the initial level of the RES# and TRST# pins are both low, the CPU and debugging section become the reset status. Then, setting the TRST# pin to high while the RES# pin is kept to low enables the TAP access to set SWJ-DP registers. After RES# pin is set to high, it is possible to access OCD registers (OIRn and OSR) in AP = 0. Debugging setting is possible after on-chip boot code runs if JTAG authentication passes, or no authentication is needed.

When the emulator is not connected, fix the TRST# pin to low, or let the signal be the same as that on the RES# pin input to the TRST# pin.

Note: When debugging is performed by CoreSight, input low to the BSCANP pin to disable the boundary scan function.

10.3.3.1 Example Connection of the Emulator That Cannot Drive the nTRST Output to High

Figure 10.4 shows an example of connection circuit when an emulator that cannot drive the nTRST output to high is used. The TRST# pin is pulled up and is asserted to low by the emulator.

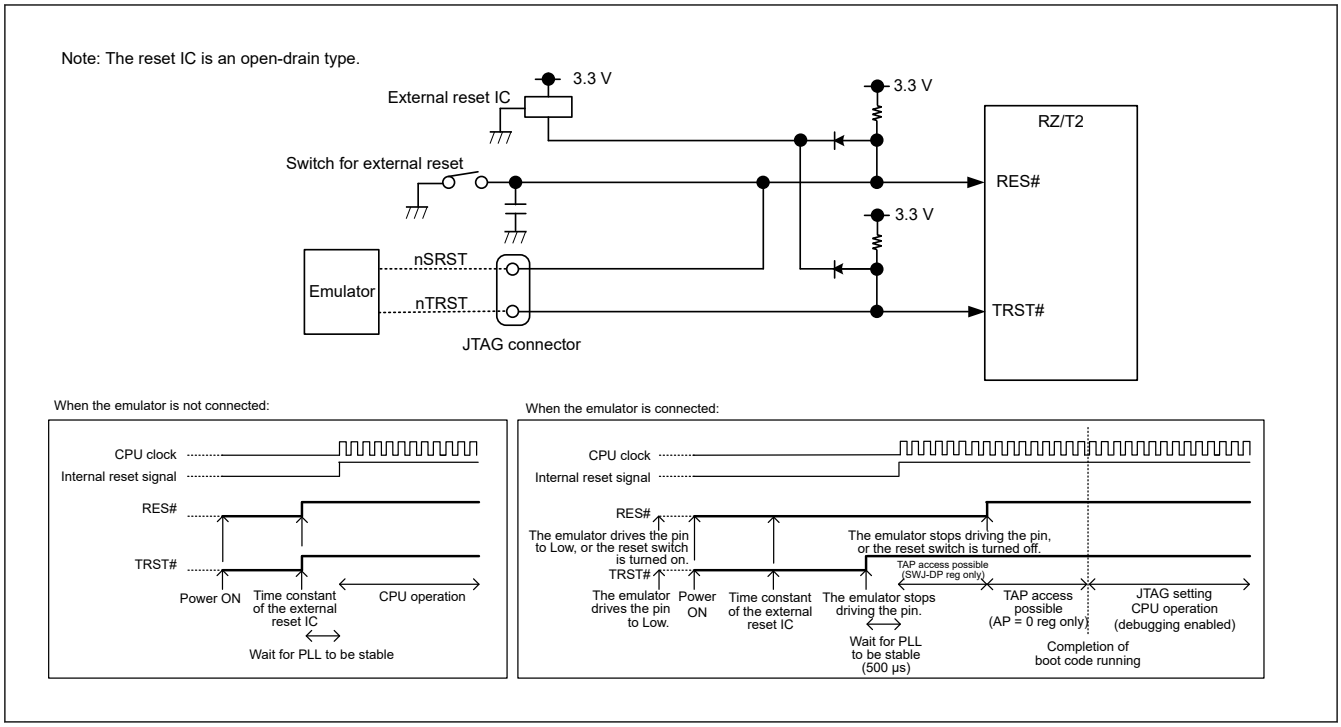

Figure 10.4 Example of connection circuit of an emulator that cannot drive the nTRST output to high

10.3.3.2 Example Connection of the Emulator That Can Drive the nTRST Output to High

Figure 10.5 shows an example of connection circuit when an emulator that can drive the nTRST output to high is used. The TRST# pin (high or low) is controlled by the emulator.

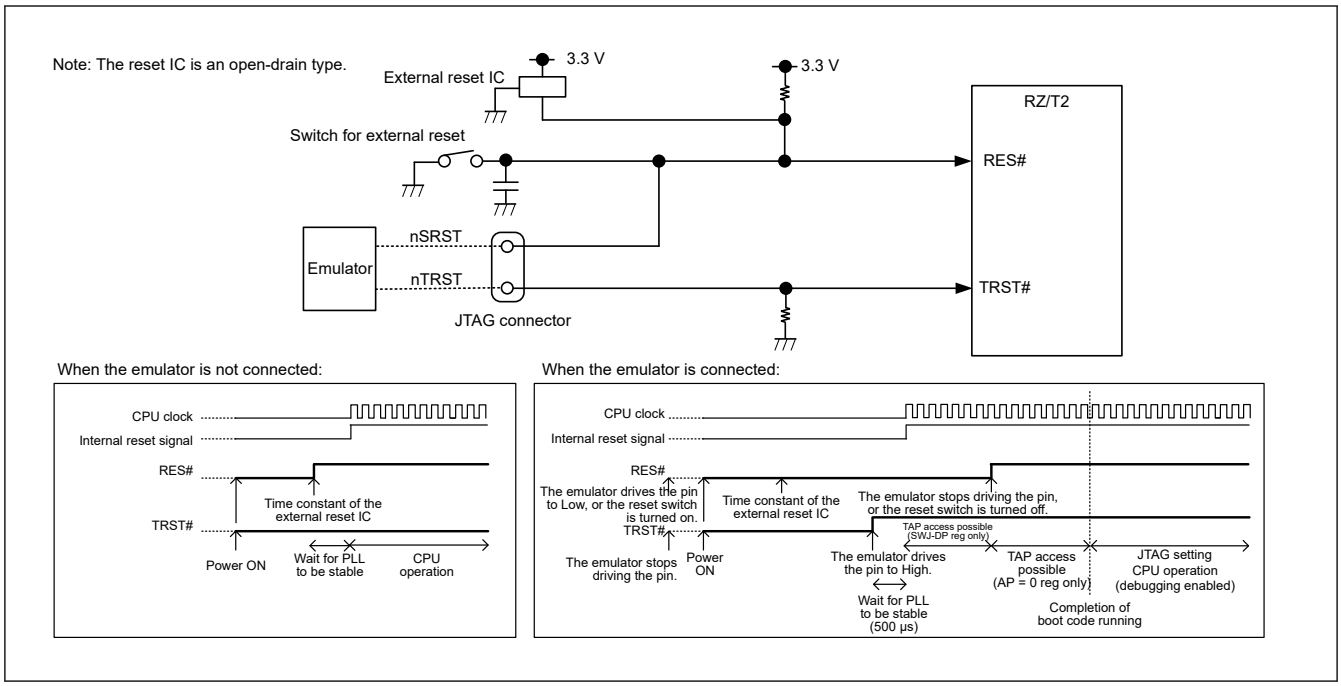

Figure 10.5 Example of connection circuit of an emulator that can drive the nTRST output to high

10.3.4 JTAG Pin Treatment When No Emulator Is Connected

If no emulator is connected, pin treatment is required according to Table 10.9.

Table 10.9 JTAG pin treatment when no emulator is connected

Pin name	Treatment
TCK	Pull down the pin (except when the port is used as a general-purpose port)
TMS	Pull up the pin (except when the port is used as a general-purpose port)
TDI	Pull up the pin (except when the port is used as a general-purpose port)
TDO	Open the pin (except when the port is used as a general-purpose port)
TRST#	Pull down the pin, or let the signal be the same as that on the RES# pin input

10.3.5 Noise Reduction of the TRST# Pin

Analog delay noise reduction is performed for the TRST# pin. This measure against noise can remove noise that is within 100 ns at maximum.

10.3.6 Available Trace Functions

Table 10.10 lists the trace functions that are available through the respective debugging ports (ETR and SWD or JTAG).

Table 10.10 Available trace functions

CPU core	Debugging port	Trace functions
Cortex-R52 CPU0, CPU1, and Cortex-A55	ETR	Full instruction and data tracing through the ETM of the Cortex-R52 CPU0, CPU1, and Cortex-A55. ETF is programmed to be in Circular Buffer mode or Hardware FIFO mode. ETR can output trace data to Main bus A.
	SWD/JTAG	The same information as for the trace port interface can be acquired through the ETF which is programmed to be in Software FIFO mode.

10.3.7 Debug Authentication

Debug authentication mechanism checks access permission for debugging and LSI resources. To obtain full debug functionality, a pass result of the authentication mechanism is required if authentication is required.

Authentication level is selectable from four states by setting AUTHMODEJ area of OTP (One Time Programmable memory):

- No authentication
- Authentication level 1 (both EL2 and EL1/EL0 access permission)
- Authentication level 2 (only EL1/EL0 access permission)
- Permanent prohibition

If authentication level 1 or 2 is selected, 128-bit authentication ID must be written to OCD Authentication ID Code Register n (OIRn) (n = 0 to 3) from debugger to compare with the ID which is already stored in OTP. Once all OIRn registers are written, authentication automatically starts and the authentication result is available in OCD Status Register (OSR). If authentication failed, then no debug connection is permitted. Reset (RES# pin reset, system software reset, or error reset) is required to retry debug authentication. If "No Authentication" is selected, RESULT[1:0] bits in OSR register indicate 01b which means both EL2 and EL1/EL0 accesses are permitted.

10.3.8 Debug Authentication Procedure

Figure 10.6 shows the debug authentication procedure.

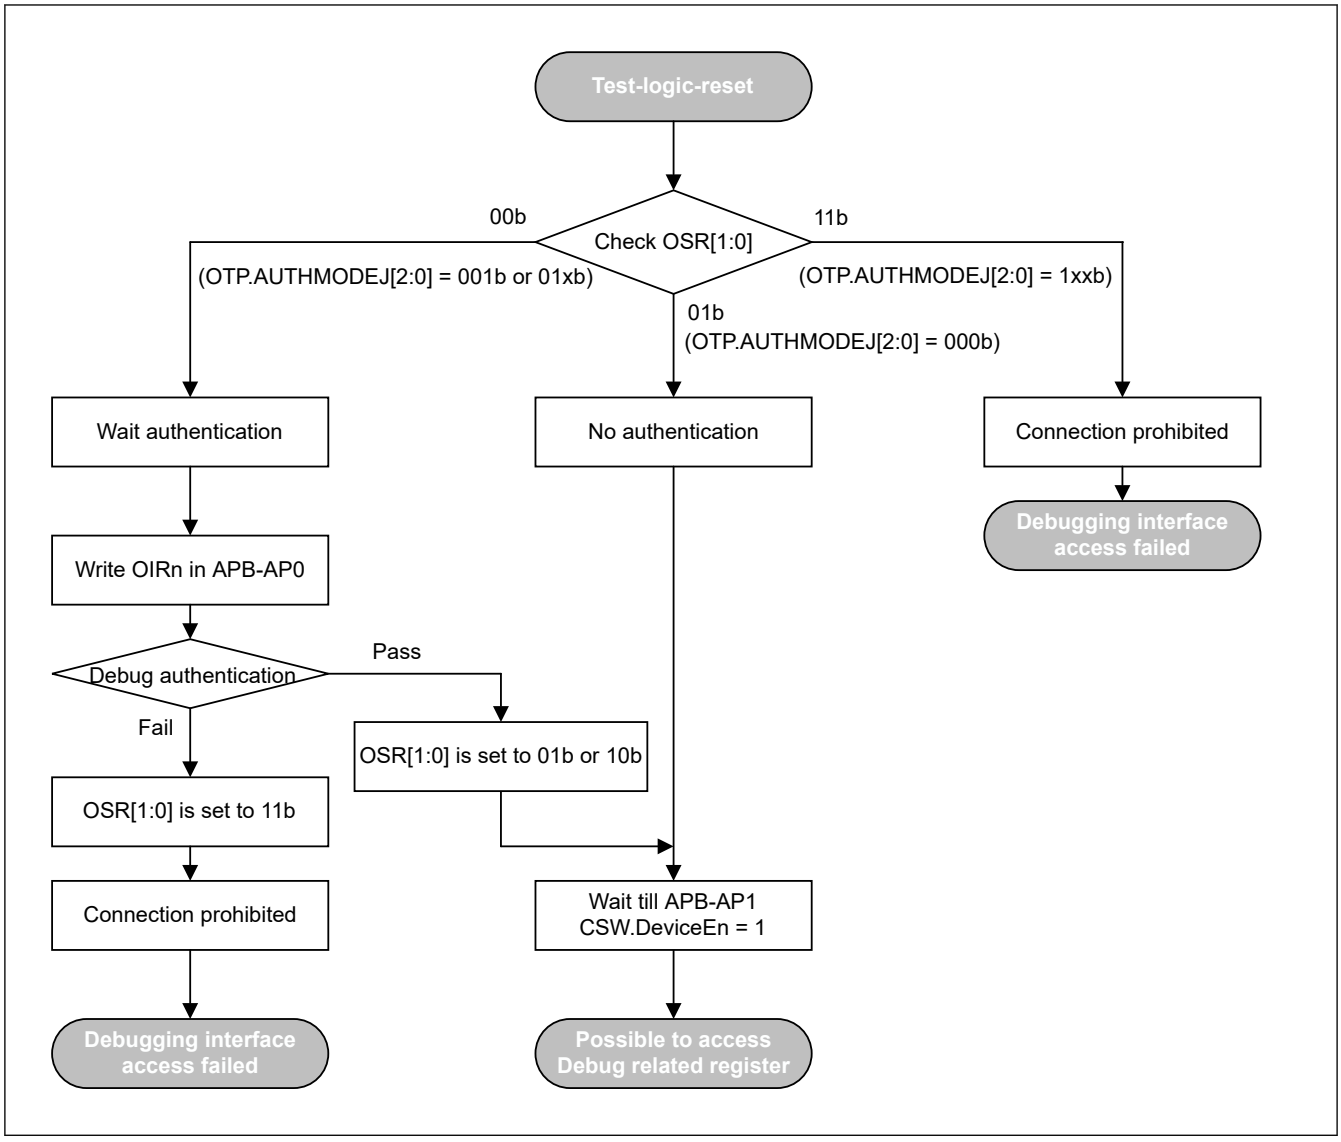

Figure 10.6 Debug authentication procedure (plaintext)

10.4 Usage Notes

10.4.1 Access to the Main Bus

Access to the main bus by the DAP is through either the Cortex-R52 CPU0, CPU1, Cortex-A55, or AXI-AP. When access is to be through the CPU except second boot CPU (Cortex-R52 CPU0 or Cortex-A55), the setting of corresponding CPU Software Reset register and Module Stop register must be changed to release the CPU from the reset state and module stop state beforehand. When access is to be through the AXI-AP, the setting of M-MPU for AXI-AP must be changed to access internal resources.

10.4.2 Authentication Level

Authentication level 2 is available only when debugger can access by EL1/EL0. In case using debugger which can access by EL2 only, do not use authentication level 2.

10.4.3 Debug Reset

The reset request from debugger is prohibited during boot operation.

11. Register Write Protection Function

11.1 Overview

The register write protection function protects important registers from being overwritten in case a program runs out of control. The registers to be protected are set with the protect register (PRCRN and PRCRS).

Table 11.1 and Table 11.2 show the relationship between the PRCRN/PRCRS register bits and the registers to be protected.

Table 11.1 Correspondence between PRCRN Register Bits and Registers to be Protected

PRCRN register	Registers to be protected
PRC0 bit	• Registers related to the clock generation circuit: SCKCR, SCKCR3, SCKCR4
PRC1 bit	• Registers related to the low power consumption functions: MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE, MSTPCRJ, MSTPCRK, MSTPCRL, MSTPCRM • Reset related registers: RSTSR0, MRCTLA, MRCTLE, MRCTLM
PRC2 bit	• GPIO-related registers: PMC13 to PMC35, PFC13 to PFC35, DRCTL13 to DRCTL35, SLPORT13 to SLPORT35 ELC_PGR1, ELC_PGR2, ELC_PGC1, ELC_PGC2, ELC_PDBF1, ELC_PDBF2, ELC_PEL0 to ELC_PEL3, ELC_DPTC, ELC_ELSR2 SLELC_PGRC, SLELC_PDBF1, SLELC_PDBF2, SLELC_PEL, SLELC_DE
PRC3 bit	• System Control registers: – Encoder interface related registers: ENCODER_CFG0 to ENCODER_CFG7, EnDAT_CFG0 to EnDAT_CFG7 – xSPI interface related registers: IOVOLCTL, CS0ENDAD, CS1STRAD, CS1ENDAD

Table 11.2 Correspondence between PRCRS Register Bits and Registers to be Protected

PRCRS register	Registers to be protected
PRC0 bit	• Registers related to the clock generation circuit: SCKCR2, PMSEL, PLL0EN, PLL0_SSC_CTR, LOCOCR, PLL2EN, PLL2_SSC_CTR, PLL3EN, PLL3_VCO_CTR0, PLL3_VCO_CTR1
PRC1 bit	• Registers related to the low power consumption functions: MSTPCRG, MSTPCRI, MSTPCRN • Reset related registers: SWRSYS, SWRCPU0, SWRCPU1, SWR55C, SWR550, SWR551, SWR552, SWR553, SWR55ARC, MRCTLI
PRC2 bit	• GPIO-related registers: PMC00 to PMC12, PFC00 to PFC12, DRCTL00 to DRCTL12, RSELP00 to RSELP12, SLPORT00 to SLPORT12, SLRSELP, SLPSR, RSELPSR
PRC3 bit	• System Control registers: – CPU related registers: RVBAL0 to RVBAL3, RVBAH0 to RVBAH3, CPU1HALT – Internal Bus related registers: STADD0 to STADD15, ENDADD0 to ENDADD15, ERRINF, ERRINF_R, ERRINF_W, SSTPCR0, SSTPCR1, SSTPCR4 to SSTPCR7, MSTACCCTL0 to MSTACCCTL3, SLVACCCTL0 to SLVACCCTL2, SLVACCCTL4 to SLVACCCTL9, ADXCTL0 to ADXCTL12 – WDT related registers: WDTDCR – System SRAM related registers: SYSRAM_CTRL0 to SYSRAM_CTRL3 – SHOSTIF related registers: SHCFG

11.2 Register Map

Table 11.3 Register Write Protection register map

Address	Register symbol	Register name	Write protection
0x8029_4200	PRCRN	Non_Safety Area Protect Register	—
0x8129_6000	PRCRS	Safety Area Protect Register	—

Table 11.4 Register Write Protection related system control register

Target	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
PRCRN and PRCRS	—	—	SLVACCCTL8.PRCR_SL

11.3 Register Descriptions

11.3.1 PRCRN : Non_Safety Area Protect Register

Base address: RWP_NS = 0x8029_4200

Offset address: 0x00

Bit position:	31																15								8				3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PRKEY[7:0]								—	—	—	—	PRC3	PRC2	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Protect 0 Enables writing to the registers related to the clock generation circuit. 0: Write disabled 1: Write enabled	R/W
1	PRC1	Protect 1 Enables writing to the registers related to low power consumption and reset. 0: Write disabled 1: Write enabled	R/W
2	PRC2	Protect 2 Enables writing to the registers related to GPIO settings. 0: Write disabled 1: Write enabled	R/W
3	PRC3	Protect 3 Enables writing to the registers related to System control. 0: Write disabled 1: Write enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control permission and prohibition of writing to the PRCRN register. To modify the PRCRN register, write 0xA5 to the PRKEY[7:0] bits. Any other value is ignored if written to the PRCRN register.*1	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write a value to the PRKEY[7:0] bits at the same time as other bits. When setting PRC0 to 1 and PRC1, PRC2, and PRC3 to 0, for example, write 0x0000A501 to the PRCRN register.

PRCi bit (Protect i) (i = 0 to 3)

Setting the PRCi bit to 1 or 0 enables or disables writing to the corresponding registers to be protected, respectively.

The PRCRN register controls writes to the protected registers for non-safety area. The non-safety area is as follows:

- 0x802C_0000 to 0x802C_FFFF: address area for GPIO-related registers
- 0x8028_0000 to 0x8028_FFFF: address area for clock generation, low power consumption, and reset registers
- 0x8029_0000 to 0x8029_FFFF: address area for system control registers

11.3.2 PRCRS : Safety Area Protect Register

Base address: RWP_S = 0x8129_6000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PRKEY[7:0]								—	—	—	—	PRC3	PRC2	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Protect 0 Enables writes to the registers related to the clock generation circuit. 0: Write disabled 1: Write enabled	R/W
1	PRC1	Protect 1 Enables writes to the registers related to low power consumption and reset. 0: Write disabled 1: Write enabled	R/W
2	PRC2	Protect 2 Enables writes to the registers related to GPIO settings. 0: Write disabled 1: Write enabled	R/W
3	PRC3	Protect 3 Enables writes to the system control registers. 0: Write disabled 1: Write enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control permission and prohibition of writing to the PRCRS register. To modify the PRCRS register, write 0xA5 to the PRKEY[7:0] bits. Any other value is ignored if written to the PRCRS register.*1	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write a value to the PRKEY[7:0] bits at the same time as other bits. When setting PRC0 to 1 and PRC1, PRC2, and PRC3 to 0, for example, write 0x0000A501 to the PRCRS register.

PRCi bit (Protect i) (i = 0 to 3)

Setting the PRCi bit to 1 or 0 enables or disables writing to the corresponding registers to be protected, respectively.

The PRCRS register controls writes to the protected registers for safety area. The safety area is as follows:

- 0x802B_0000 to 0x802B_FFFF and 0x812C_0000 to 0x812C_FFFF: address area for GPIO-related registers
- 0x8128_0000 to 0x8128_FFFF: address area for clock generation, low power consumption, and reset registers
- 0x8129_0000 to 0x8129_FFFF: address area for system control registers

12. Interrupt Controller (ICU)

12.1 Overview

The interrupt controller accepts interrupt request from peripheral module, external pins include the external DMA request pins. An interrupt accepted by the interrupt controller is set either as an interrupt to the CPU (Cortex-A55, Cortex-R52 CPU0 and CPU1) or as an activating trigger signal for the DMAC and ELC.

Table 12.1 lists the specifications of the ICU, and Figure 12.1 shows a block diagram of the interrupt controller.

Table 12.1 ICU specifications

Item		Description
Interrupts	Interrupt contact destinations	• Cortex-A55 (via GIC-600) • Cortex-R52 CPU0 • Cortex-R52 CPU1 • Three DMAC units • ELC
	Peripheral function interrupts	• Interrupts from peripheral modules • Interrupt detection: Edge detection/Level detection (dependent on peripheral modules) • GPT/MTU3 events are selectable from max 14 to 4 interrupts each channel. • Encoder interface events are selectable from 5 modules to 1 module each unit. • A part of the assignment of the event source to Cortex-R52 GIC SPI is selectable. • Assignment of the event source to Cortex-A55 GIC-600 SPI is fixed.
	External pin interrupts	Interrupts from pins IRQ0 to IRQ15 Number of sources: 16 IRQ0 to IRQ13: for NONSAFETY IRQ14 to IRQ15: for SAFETY Interrupt detection: Low level/falling edge/rising edge/rising and falling edges. One of these detection methods can be set for each source. Digital noise filter function: Supported
	Interrupts between the CPUs	Mutual interrupts among Cortex-A55, Cortex-R52 CPU0 and CPU1 by software interrupts Number of sources: 16 INTCPU0 to INTCPU13: for NONSAFETY INTCPU14, INTCPU15: for SAFETY
	Error events	• Error events from CPU and peripherals are captured and merged to multiple interrupts with mask. Initial state is all masked. (no interrupt generated) • Hardware reset can be generated by error events.
	DMAC control	Interrupts can be assigned as DMA activation sources.
	External DMA request	External DMA request pins (DREQ) can output DACK, TEND when DMA transfer to external bus. Number of sources: 1 Digital noise filter function: Supported
System error interrupt	SEI pin interrupt	Interrupts from the SEI pin Interrupt detection: Low level/falling edge/rising edge/rising and falling edges. One of these detection methods can be set Digital noise filter function: Supported The SEI pin is connected to SEI and VSEI for Cortex-R52 CPU0 and CPU1, and SPI for Cortex-A55.
Restoration from the sleep status		Restoration due to non-maskable interrupt and all unmasked interrupt sources

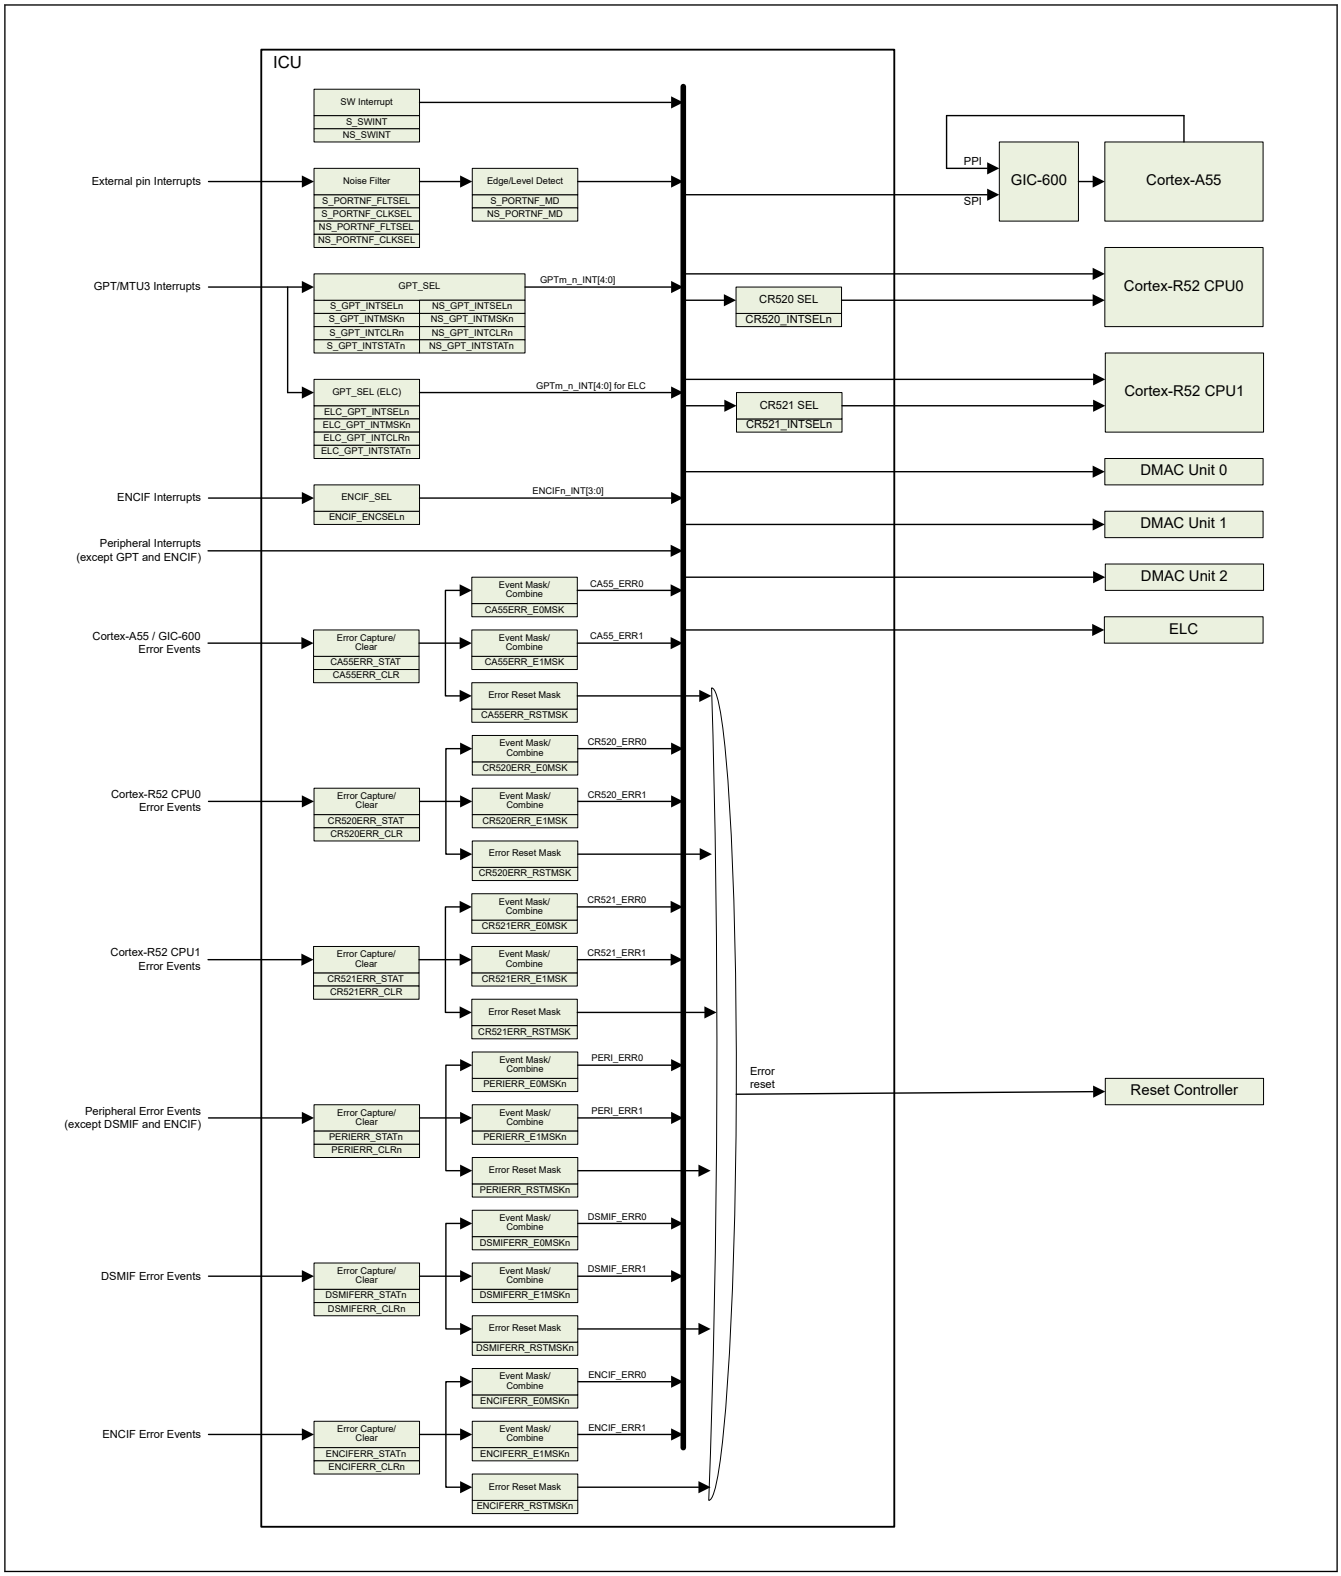

Figure 12.1 Block diagram of interrupt controller unit

12.3 Register Descriptions

This section describes details of the register functions.

12.3.1 Safety Region Registers

12.3.1.1 S_SWINT : Software Interrupt Register for Safety Register

Base address: ICU_S = 0x812A_0000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IC15	IC14
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IC14	Software Interrupt register Occur software interrupt INTCPU14 when this value is set to 1. This bit is read as 0.	W
1	IC15	Software Interrupt register Occur software interrupt INTCPU15 when this value is set to 1. This bit is read as 0.	W

Bit	Symbol	Function	R/W
31:2	—	The write value should be 0.	W

12.3.1.2 S_PORTNF_FLTSEL : Interrupt Noise Filter Enable Register for Safety Register

Base address: ICU_S = 0x812A_0000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	FLTSEI	FLT15	FLT14
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLT14	Noise filter enable for IRQ14 0: Disable 1: Enable	R/W
1	FLT15	Noise filter enable for IRQ15 0: Disable 1: Enable	R/W
2	FLTSEI	Noise filter enable for SEI 0: Disable 1: Enable	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

12.3.1.3 S_PORTNF_CLKSEL : Interrupt Noise Filter Setting Register for Safety Register

Base address: ICU_S = 0x812A_0000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CLKSELSEI[1:0]		CKSEL15[1:0]		CKSEL14[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CKSEL14[1:0]	Select noise filter sampling frequency dividend rate for IRQ14. Sampling clock is generated by divided PCLKM. 0 0: Divided by 1 0 1: Divided by 8 1 0: Divided by 32 1 1: Divided by 64	R/W

Bit	Symbol	Function	R/W
3:2	CKSEL15[1:0]	Select noise filter sampling frequency dividend rate for IRQ15. Sampling clock is generated by divided PCLKM. 0 0: Divided by 1 0 1: Divided by 8 1 0: Divided by 32 1 1: Divided by 64	R/W
5:4	CLKSELSEI[1:0]	Select noise filter sampling frequency dividend rate for SEI. Sampling clock is generated by divided PCLKM. 0 0: Divided by 1 0 1: Divided by 8 1 0: Divided by 32 1 1: Divided by 64	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

12.3.1.4 S_PORTNF_MD : Interrupt Edge Detection Setting Register for Safety Register

Base address: ICU_S = 0x812A_0000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	MDSEI[1:0]		MD15[1:0]		MD14[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	1

Bit	Symbol	Function	R/W
1:0	MD14[1:0]	Select detection mode for IRQ14 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Falling and rising edges	R/W
3:2	MD15[1:0]	Select detection mode for IRQ15 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Falling and rising edges	R/W
5:4	MDSEI[1:0]	Select detection mode for SEI 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Falling and rising edges	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

12.3.1.5 S_GPT_INTSELn : Safety GPT Interrupt Select Register n (n = 0, 1)

Base address: ICU_S = 0x812A_0000

Offset address: 0x020 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	INTSELY_3[3:0]				INTSELY_2[3:0]				INTSELY_1[3:0]				INTSELY_0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	INTSELX_3[3:0]				INTSELX_2[3:0]				INTSELX_1[3:0]				INTSELX_0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	INTSELX_0[3:0]	Select GPT event source to be output as GPTx_INT0 event	R/W
7:4	INTSELX_1[3:0]	Select GPT event source to be output as GPTx_INT1 event	R/W
11:8	INTSELX_2[3:0]	Select GPT event source to be output as GPTx_INT2 event	R/W
15:12	INTSELX_3[3:0]	Select GPT event source to be output as GPTx_INT3 event	R/W
19:16	INTSELY_0[3:0]	Select GPT event source to be output as GPTy_INT0 event	R/W
23:20	INTSELY_1[3:0]	Select GPT event source to be output as GPTy_INT1 event	R/W
27:24	INTSELY_2[3:0]	Select GPT event source to be output as GPTy_INT2 event	R/W
31:28	INTSELY_3[3:0]	Select GPT event source to be output as GPTy_INT3 event	R/W

Note: Relation among n, x and y is shown in the below table.

n	x	y
0	10_0	10_1
1	10_2	10_3

The S_GPT_INTSELn register specifies a Safety GPT (GPT10) event source to be output as GPTx/y_INT[3:0] event source for Cortex-A55 SPI and Cortex-R52 SPI. Table 12.4 shows which Safety GPT event source is selected by INTSEL bits.

Table 12.4 Safety GPT event source selected by INTSEL bits

	n = 0		n = 1	
	x	y	x	y
INTSEL bits	10_0	10_1	10_2	10_3
0x0	GPTx/y_CCMPA			
0x1	GPTx/y_CCMPB			
0x2	GPTx/y_CMPC			
0x3	GPTx/y_CMPD			
0x4	GPTx/y_CMPE			
0x5	GPTx/y_CMPF			
0x6	GPTx/y_OVF			
0x7	GPTx/y_UDF			
0x8 to 0xF	0			

12.3.1.6 S_GPT_INTMSKn : Safety GPT Combined Interrupt Mask Register n (n = 0, 1)

Base address: ICU_S = 0x812A_0000

Offset address: 0x030 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	IY_MK7	IY_MK6	IY_MK5	IY_MK4	IY_MK3	IY_MK2	IY_MK1	IY_MK0
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IX_MK7	IX_MK6	IX_MK5	IX_MK4	IX_MK3	IX_MK2	IX_MK1	IX_MK0
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	IX_MK0	Mask GPTx_CCMPA event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
1	IX_MK1	Mask GPTx_CCMPB event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
2	IX_MK2	Mask GPTx_CMPC event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
3	IX_MK3	Mask GPTx_CMPD event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
4	IX_MK4	Mask GPTx_CMPE event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
5	IX_MK5	Mask GPTx_CMPF event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
6	IX_MK6	Mask GPTx_OVF event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
7	IX_MK7	Mask GPTx_UDF event source from GPT combined event, GPTx_INT4 0: No masked 1: Masked	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
16	IY_MK0	Mask GPTy_CCMPA event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
17	IY_MK1	Mask GPTy_CCMPB event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
18	IY_MK2	Mask GPTy_CMPC event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
19	IY_MK3	Mask GPTy_CMPD event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
20	IY_MK4	Mask GPTy_CMPE event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W

Bit	Symbol	Function	R/W
21	IY_MK5	Mask GPTy_CMPF event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
22	IY_MK6	Mask GPTy_OVF event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
23	IY_MK7	Mask GPTy_UDF event source from GPT combined event, GPTy_INT4 0: No masked 1: Masked	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: Relation among n, x and y is shown in the below table.

n	x	y
0	10_0	10_1
1	10_2	10_3

The S_GPT_INTMSKn register is used to mask Safety GPT (GPT10) event sources to be combined as GPTx/y_INT4 event source for Cortex-A55 SPI and Cortex-R52 SPI. When the bit is masked, corresponding event does not occur GPTx/y_INT4 event.

12.3.1.7 S_GPT_INTCLRn : Safety GPT Combined Interrupt Status Clear Register n (n = 0, 1)

Base address: ICU_S = 0x812A_0000

Offset address: 0x038 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	IY_CL7	IY_CL6	IY_CL5	IY_CL4	IY_CL3	IY_CL2	IY_CL1	IY_CL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IX_CL7	IX_CL6	IX_CL5	IX_CL4	IX_CL3	IX_CL2	IX_CL1	IX_CL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IX_CL0	Clear GPTx_CCMPA event status captured in S_GPT_INTSTATn register by writing 1	W
1	IX_CL1	Clear GPTx_CCMPB event status captured in S_GPT_INTSTATn register by writing 1	W
2	IX_CL2	Clear GPTx_CMPC event status captured in S_GPT_INTSTATn register by writing 1	W
3	IX_CL3	Clear GPTx_CMPD event status captured in S_GPT_INTSTATn register by writing 1	W
4	IX_CL4	Clear GPTx_CMPE event status captured in S_GPT_INTSTATn register by writing 1	W
5	IX_CL5	Clear GPTx_CMPF event status captured in S_GPT_INTSTATn register by writing 1	W
6	IX_CL6	Clear GPTx_OVF event status captured in S_GPT_INTSTATn register by writing 1	W
7	IX_CL7	Clear GPTx_UDF event status captured in S_GPT_INTSTATn register by writing 1	W
15:8	—	The write value should be 0.	W
16	IY_CL0	Clear GPTy_CCMPA event status captured in S_GPT_INTSTATn register by writing 1	W
17	IY_CL1	Clear GPTy_CCMPB event status captured in S_GPT_INTSTATn register by writing 1	W
18	IY_CL2	Clear GPTy_CMPC event status captured in S_GPT_INTSTATn register by writing 1	W
19	IY_CL3	Clear GPTy_CMPD event status captured in S_GPT_INTSTATn register by writing 1	W

Bit	Symbol	Function	R/W
20	IY_CL4	Clear GPTy_CMPE event status captured in S_GPT_INTSTATn register by writing 1	W
21	IY_CL5	Clear GPTy_CMPF event status captured in S_GPT_INTSTATn register by writing 1	W
22	IY_CL6	Clear GPTy_OVF event status captured in S_GPT_INTSTATn register by writing 1	W
23	IY_CL7	Clear GPTy_UDF event status captured in S_GPT_INTSTATn register by writing 1	W
31:24	—	The write value should be 0.	W

Note: Relation among n, x and y is shown in the below table.

n	x	y
0	10_0	10_1
1	10_2	10_3

The S_GPT_INTCLRn register is used to clear Safety GPT (GPT10) event status captured in S_GPT_INTSTATn register.

12.3.1.8 S_GPT_INTSTATn : Safety GPT Combined Interrupt Status Register n (n = 0, 1)

Base address: ICU_S = 0x812A_0000

Offset address: 0x040 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	IY_ST7	IY_ST6	IY_ST5	IY_ST4	IY_ST3	IY_ST2	IY_ST1	IY_ST0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IX_ST7	IX_ST6	IX_ST5	IX_ST4	IX_ST3	IX_ST2	IX_ST1	IX_ST0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IX_ST0	Indicate captured GPTx_CCMPA event status 0: No event occurs 1: Event occurs	R
1	IX_ST1	Indicate captured GPTx_CCMPB event status 0: No event occurs 1: Event occurs	R
2	IX_ST2	Indicate captured GPTx_CMPC event status 0: No event occurs 1: Event occurs	R
3	IX_ST3	Indicate captured GPTx_CMPD event status 0: No event occurs 1: Event occurs	R
4	IX_ST4	Indicate captured GPTx_CMPE event status 0: No event occurs 1: Event occurs	R
5	IX_ST5	Indicate captured GPTx_CMPF event status 0: No event occurs 1: Event occurs	R
6	IX_ST6	Indicate captured GPTx_OVF event status 0: No event occurs 1: Event occurs	R
7	IX_ST7	Indicate captured GPTx_UDF event status 0: No event occurs 1: Event occurs	R

Bit	Symbol	Function	R/W
15:8	—	These bits are read as 0.	R
16	IY_ST0	Indicate captured GPTy_CCMPA event status 0: No event occurs 1: Event occurs	R
17	IY_ST1	Indicate captured GPTy_CCMPB event status 0: No event occurs 1: Event occurs	R
18	IY_ST2	Indicate captured GPTy_CMPC event status 0: No event occurs 1: Event occurs	R
19	IY_ST3	Indicate captured GPTy_CMPD event status 0: No event occurs 1: Event occurs	R
20	IY_ST4	Indicate captured GPTy_CMPE event status 0: No event occurs 1: Event occurs	R
21	IY_ST5	Indicate captured GPTy_CMPF event status 0: No event occurs 1: Event occurs	R
22	IY_ST6	Indicate captured GPTy_OVF event status 0: No event occurs 1: Event occurs	R
23	IY_ST7	Indicate captured GPTy_UDF event status 0: No event occurs 1: Event occurs	R
31:24	—	These bits are read as 0.	R

Note: Relation among n, x and y is shown in the below table.

n	x	y
0	10_0	10_1
1	10_2	10_3

The S_GPT_INTSTATn register indicates captured status for Safety GPT (GPT10) events for Cortex-A55 SPI and Cortex-R52 SPI.

12.3.2 Non-Safety Region Registers

12.3.2.1 NS_SWINT : Software Interrupt Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	IC13	IC12	IC11	IC10	IC9	IC8	IC7	IC6	IC5	IC4	IC3	IC2	IC1	IC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IC0	Software Interrupt register Occur software interrupt INTCPU0 when this value is set to 1. This bit is read as 0.	W
1	IC1	Software Interrupt register Occur software interrupt INTCPU1 when this value is set to 1. This bit is read as 0.	W
2	IC2	Software Interrupt register Occur software interrupt INTCPU2 when this value is set to 1. This bit is read as 0.	W
3	IC3	Software Interrupt register Occur software interrupt INTCPU3 when this value is set to 1. This bit is read as 0.	W
4	IC4	Software Interrupt register Occur software interrupt INTCPU4 when this value is set to 1. This bit is read as 0.	W
5	IC5	Software Interrupt register Occur software interrupt INTCPU5 when this value is set to 1. This bit is read as 0.	W
6	IC6	Software Interrupt register Occur software interrupt INTCPU6 when this value is set to 1. This bit is read as 0.	W
7	IC7	Software Interrupt register Occur software interrupt INTCPU7 when this value is set to 1. This bit is read as 0.	W
8	IC8	Software Interrupt register Occur software interrupt INTCPU8 when this value is set to 1. This bit is read as 0.	W
9	IC9	Software Interrupt register Occur software interrupt INTCPU9 when this value is set to 1. This bit is read as 0.	W
10	IC10	Software Interrupt register Occur software interrupt INTCPU10 when this value is set to 1. This bit is read as 0.	W
11	IC11	Software Interrupt register Occur software interrupt INTCPU11 when this value is set to 1. This bit is read as 0.	W
12	IC12	Software Interrupt register Occur software interrupt INTCPU12 when this value is set to 1. This bit is read as 0.	W
13	IC13	Software Interrupt register Occur software interrupt INTCPU13 when this value is set to 1. This bit is read as 0.	W
31:14	—	The write value should be 0.	W

12.3.2.2 NS_PORTNF_FLTSEL : Interrupt Noise Filter Enable Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	FLTDRQ	FLT13	FLT12	FLT11	FLT10	FLT9	FLT8	FLT7	FLT6	FLT5	FLT4	FLT3	FLT2	FLT1	FLT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLT0	Noise filter enable for IRQ0 0: Disable 1: Enable	R/W
1	FLT1	Noise filter enable for IRQ1 0: Disable 1: Enable	R/W
2	FLT2	Noise filter enable for IRQ2 0: Disable 1: Enable	R/W
3	FLT3	Noise filter enable for IRQ3 0: Disable 1: Enable	R/W
4	FLT4	Noise filter enable for IRQ4 0: Disable 1: Enable	R/W
5	FLT5	Noise filter enable for IRQ5 0: Disable 1: Enable	R/W
6	FLT6	Noise filter enable for IRQ6 0: Disable 1: Enable	R/W
7	FLT7	Noise filter enable for IRQ7 0: Disable 1: Enable	R/W
8	FLT8	Noise filter enable for IRQ8 0: Disable 1: Enable	R/W
9	FLT9	Noise filter enable for IRQ9 0: Disable 1: Enable	R/W
10	FLT10	Noise filter enable for IRQ10 0: Disable 1: Enable	R/W
11	FLT11	Noise filter enable for IRQ11 0: Disable 1: Enable	R/W
12	FLT12	Noise filter enable for IRQ12 0: Disable 1: Enable	R/W

Bit	Symbol	Function	R/W
13	FLT13	Noise filter enable for IRQ13 0: Disable 1: Enable	R/W
14	FLTDRQ	Noise filter enable for External DMA request (DREQ) 0: Disable 1: Enable	R/W
31:15	—	These bits are read as 0. The write value should be 0.	R/W

12.3.2.3 NS_PORTNF_CLKSEL : Interrupt Noise Filter Setting Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	CKSELDREQ[1:0]		CKSEL13[1:0]		CKSEL12[1:0]		CKSEL11[1:0]		CKSEL10[1:0]		CKSEL9[1:0]		CKSEL8[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CKSEL7[1:0]		CKSEL6[1:0]		CKSEL5[1:0]		CKSEL4[1:0]		CKSEL3[1:0]		CKSEL2[1:0]		CKSEL1[1:0]		CKSEL0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CKSEL0[1:0]	Noise filter sampling clock selector Select noise filter sampling frequency dividend rate for IRQ0. Sampling clock is generated by divided PCLKM. 0 0: Divided by 1 0 1: Divided by 8 1 0: Divided by 32 1 1: Divided by 64	R/W
3:2	CKSEL1[1:0]	Noise filter sampling clock selector Select noise filter sampling frequency dividend rate for IRQ1. Sampling clock is generated by divided PCLKM. 0 0: Divided by 1 0 1: Divided by 8 1 0: Divided by 32 1 1: Divided by 64	R/W

29:28	MDDRQ[1:0]	Select detection mode for DREQ of DMAC 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Falling and rising edges	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

12.3.2.5 CA55ERR_E0MSK : CA55 E0 Error Event Mask Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	E0_MK12	E0_MK11	E0_MK10	E0_MK9	E0_MK8	E0_MK7	E0_MK6	E0_MK5	E0_MK4	E0_MK3	E0_MK2	E0_MK1	E0_MK0
Value after reset:	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	E0_MK0	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
1	E0_MK1	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
2	E0_MK2	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
3	E0_MK3	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
4	E0_MK4	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
5	E0_MK5	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
6	E0_MK6	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
7	E0_MK7	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
8	E0_MK8	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
9	E0_MK9	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
10	E0_MK10	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
11	E0_MK11	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
12	E0_MK12	Mask captured error status as an CA55_ERR0 event for CA55ERR_STAT 0: Release 1: Mask	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

The CA55ERR_E0MSK register is used to mask error status for CA55_ERR0 event. When the bit is masked, corresponding error does not occur CA55_ERR0 event.

12.3.2.6 CA55ERR_E1MSK : CA55 E1 Error Event Mask Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x054

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit field:	—	—	—	ER_CL12	ER_CL11	ER_CL10	ER_CL9	ER_CL8	ER_CL7	ER_CL6	ER_CL5	ER_CL4	ER_CL3	ER_CL2	ER_CL1	ER_CL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ER_CL0	Clear captured error status for CA55ERR_STAT register by writing 1	W
1	ER_CL1	Clear captured error status for CA55ERR_STAT register by writing 1	W
2	ER_CL2	Clear captured error status for CA55ERR_STAT register by writing 1	W
3	ER_CL3	Clear captured error status for CA55ERR_STAT register by writing 1	W
4	ER_CL4	Clear captured error status for CA55ERR_STAT register by writing 1	W
5	ER_CL5	Clear captured error status for CA55ERR_STAT register by writing 1	W
6	ER_CL6	Clear captured error status for CA55ERR_STAT register by writing 1	W
7	ER_CL7	Clear captured error status for CA55ERR_STAT register by writing 1	W
8	ER_CL8	Clear captured error status for CA55ERR_STAT register by writing 1	W
9	ER_CL9	Clear captured error status for CA55ERR_STAT register by writing 1	W
10	ER_CL10	Clear captured error status for CA55ERR_STAT register by writing 1	W
11	ER_CL11	Clear captured error status for CA55ERR_STAT register by writing 1	W
12	ER_CL12	Clear captured error status for CA55ERR_STAT register by writing 1	W
31:13	—	The write value should be 0.	W

The CA55ERR_CLR register is used to clear error status captured in CA55ERR_STAT register.

12.3.2.9 CA55ERR_STAT : CA55 Error Event Status Register

Base address: ICU_NS = 0x802A_0000

Offset address: 0x064

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	ER_ST12	ER_ST11	ER_ST10	ER_ST9	ER_ST8	ER_ST7	ER_ST6	ER_ST5	ER_ST4	ER_ST3	ER_ST2	ER_ST1	ER_ST0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ER_ST0	Indicate captured error status for nFAULTIRQ1 from Cortex-A55 0: No error 1: Error occurred	R
1	ER_ST1	Indicate captured error status for nFAULTIRQ2 from Cortex-A55 0: No error 1: Error occurred	R
2	ER_ST2	Indicate captured error status for nFAULTIRQ3 from Cortex-A55 0: No error 1: Error occurred	R
3	ER_ST3	Indicate captured error status for nFAULTIRQ4 from Cortex-A55 0: No error 1: Error occurred	R
4	ER_ST4	Indicate captured error status for nFAULTIRQ0 from Cortex-A55 0: No error 1: Error occurred	R
5	ER_ST5	Indicate captured error status for nERRIRQ1 from Cortex-A55 0: No error 1: Error occurred	R
6	ER_ST6	Indicate captured error status for nERRIRQ2 from Cortex-A55 0: No error 1: Error occurred	R
7	ER_ST7	Indicate captured error status for nERRIRQ3 from Cortex-A55 0: No error 1: Error occurred	R
8	ER_ST8	Indicate captured error status for nERRIRQ4 from Cortex-A55 0: No error 1: Error occurred	R
9	ER_ST9	Indicate captured error status for nERRIRQ0 from Cortex-A55 0: No error 1: Error occurred	R
10	ER_ST10	Indicate captured error status for fault_int from GIC-600 0: No error 1: Error occurred	R
11	ER_ST11	Indicate captured error status for err_int from GIC-600 0: No error 1: Error occurred	R
12	ER_ST12	Indicate captured error status for pmu_int from GIC-600 0: No error 1: Error occurred	R
31:13	—	These bits are read as 0.	R

The CA55ERR_STAT register indicates captured status for error events from Cortex-A55 and GIC-600.

12.3.2.10 CR520ERR_E0MSK : CR52 CPU0 E0 Error Event Mask Register

Base address: ICU_NS = 0x802A_0000

30	ER_ST30	Indicate captured error status for error event from Encoder Interface modules 0: No error 1: Error occurred	R
31	ER_ST31	Indicate captured error status for error event from Encoder Interface modules 0: No error 1: Error occurred	R

Note 1. Value after reset is 1 dependent on bit assignment. See Table 12.7.

The ENCIFERR_STATn register indicates captured status for error events from Encoder Interface modules. Table 12.7 lists bit assignment of error events.

Table 12.7 Bit assignment of Encoder Interface error event (1 of 2)

Bit	ENCIFERR_STATn	
	n = 0	n = 1 to 4
0	BISS00_NER*5	HDSLa_estimator_on*1 *5
1	BISS01_NER*5	HDSLa_safe_channel_err*1 *5
2	BISS02_NER*5	HDSLa_safe_pos_err*1 *5
3	BISS03_NER*5	HDSLa_acceleration_err*1 *5
4	BISS04_NER*5	HDSLa_acc_thr_err*1
5	BISS05_NER*5	HDSLa_encoding_err*1
6	BISS06_NER*5	HDSLa_dev_thr_err*1 *5
7	BISS07_NER*5	Reserved (Read as 0)
8	BISS08_NER*5	HDSLb_estimator_on*2 *5
9	BISS09_NER*5	HDSLb_safe_channel_err*2 *5
10	BISS10_NER*5	HDSLb_safe_pos_err*2 *5
11	BISS11_NER	HDSLb_acceleration_err*2 *5
12	BISS12_NER	HDSLb_acc_thr_err*2
13	BISS13_NER	HDSLb_encoding_err*2
14	BISS14_NER	HDSLb_dev_thr_err*2 *5
15	BISS15_NER	Reserved (Read as 0)
16	AFMT00_TMOUT	HDSLc_estimator_on*3 *5
17	AFMT01_TMOUT	HDSLc_safe_channel_err*3 *5
18	AFMT02_TMOUT	HDSLc_safe_pos_err*3 *5
19	AFMT03_TMOUT	HDSLc_acceleration_err*3 *5
20	AFMT04_TMOUT	HDSLc_acc_thr_err*3

Table 12.7 Bit assignment of Encoder Interface error event (2 of 2)

Bit	ENCIFERR_STATn	
	n = 0	n = 1 to 4
21	AFMT05_TMOUT	HDSLc_encoding_err*3
22	AFMT06_TMOUT	HDSLc_dev_thr_err*3 *5
23	AFMT07_TMOUT	Reserved (Read as 0)
24	AFMT08_TMOUT	HDSLd_estimator_on*4 *5
25	AFMT09_TMOUT	HDSLd_safe_channel_err*4 *5
26	AFMT10_TMOUT	HDSLd_safe_pos_err*4 *5
27	AFMT11_TMOUT	HDSLd_acceleration_err*4 *5
28	AFMT12_TMOUT	HDSLd_acc_thr_err*4
29	AFMT13_TMOUT	HDSLd_encoding_err*4
30	AFMT14_TMOUT	HDSLd_dev_thr_err*4 *5
31	AFMT15_TMOUT	Reserved (Read as 0)

Note 1. a = (n - 1) × 4
Note 2. b = (n - 1) × 4 + 1
Note 3. c = (n - 1) × 4 + 2
Note 4. d = (n - 1) × 4 + 3
Note 5. Value after reset is 1. Clear the bit before operation.

12.3.2.35 ENCIF_ENCSEL0 : ENCIF Event Select Register 0

9	03_3	03_4	19	07_3	07_4			

The NS_GPT_INTSTATn register indicates captured status for GPT (GPT00 to GPT09) and MTU3 events for Cortex-A55 SPI, Cortex-R52 SPI and DMAC.

The bits for MTU3 event status are valid only for n = 0 to 4. Table 12.12 shows MTU3 event status mapping.

Table 12.12 MTU3 event status mapping

	n = 0		n = 1		n = 2		n = 3		n = 4		n = 5 to 25

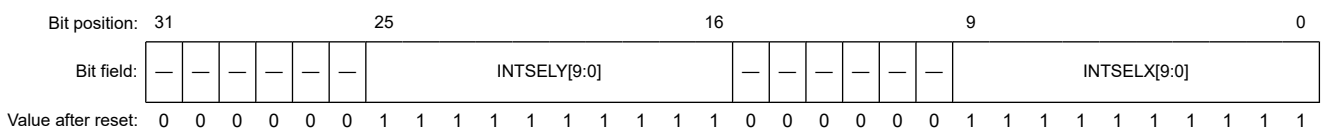
12.3.2.41 CR520_INTSELn : CR52 CPU0 Interrupt Select Register n (n = 0 to 79)

Base address: ICU_NS = 0x802A_0000

Offset address: 0x418 + 0x04 × n



Bit	Symbol	Function	R/W
9:0	INTSELX[9:0]	Set the number of the event source to be select as Cortex-R52 CPU0 selected peripheral interrupt x (SELECT0_IRQx). Event source is selectable from Table 12.17. If SELECT0_IRQx is not used, set 0x3FF (Fixed to 0 output).*1 Setting of the number not listed in Table 12.17 is prohibited.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	INTSELY[9:0]	Set the number of the event source to be select as Cortex-R52 CPU0 selected peripheral interrupt y (SELECT0_IRQy). Event source is selectable from Table 12.17. If SELECT0_IRQy is not used, set 0x3FF (Fixed to 0 output).*2 Setting of the number not listed in Table 12.17 is prohibited.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. x = 2 × n
Note 2. y = 2 × n + 1

12.3.2.42 CR521_INTSELn : CR52 CPU1 Interrupt Select Register n (n = 0 to 79)

Base address: ICU_NS = 0x802A_0000

Offset address: 0x558 + 0x04 × n

Bit position:	31						25									16						9								0
Bit field:	—	—	—	—	—	—	INTSELY[9:0]									—	—	—	—	—	—	INTSELX[9:0]									
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
9:0	INTSELX[9:0]	Set the number of the event source to be select as Cortex-R52 CPU1 selected peripheral interrupt x (SELECT1_IRQx). Event source is selectable from Table 12.17. If SELECT1_IRQx is not used, set 0x3FF (Fixed to 0 output).*1 Setting of the number not listed in Table 12.17 is prohibited.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	INTSELY[9:0]	Set the number of the event source to be select as Cortex-R52 CPU1 selected peripheral interrupt y (SELECT1_IRQy). Event source is selectable from Table 12.17. If SELECT1_IRQy is not used, set 0x3FF (Fixed to 0 output).*2 Setting of the number not listed in Table 12.17 is prohibited.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. x = 2 × n
Note 2. y = 2 × n + 1

12.3.3 ELC Related Registers

12.3.3.1 ELC_GPT_INTSELn : GPT/MTU3 ELC event source Select Register n (n = 0 to 25)

Base address: ICU_NS = 0x802A_0000

Offset address: 0x330 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

The ELC_GPT_INTMSKn register is used to mask GPT (GPT00 to GPT09) and MTU3 event sources to be combined as GPTx/y_INT4 event source for ELC. When the bit is masked, corresponding event does not occur GPTx/y_INT4 event.

The bits for MTU3 event sources are valid only for n = 0 to 4. Table 12.14 shows MTU3 event source mapping.

9	03_3	03_4	19	07_3	07_4			

The ELC_GPT_INTSTATn register indicates captured status for GPT (GPT00 to GPT09) and MTU3 events for ELC.

The bits for MTU3 event status are valid only for n = 0 to 4. Table 12.15 shows MTU3 event status mapping.

12.4 Operations

12.4.1 Event Handling

Events and interrupts from internal modules and external pins include the external DMA request pins are connected to the GIC (Generic Interrupt Controller) SPI (Shared Peripheral Interrupts) of the CPUs (Cortex-A55, Cortex-R52 CPU0, and Cortex-R52 CPU1) and/or the DMAC and ELC as an activating trigger signal.

GPT/MTU3 events are selectable from max 14 to 4 interrupts each channel by setting NS_GPT_INTSELn (n = 0 to 25) register and S_GPT_INTSELn (n = 0, 1) register. Additionally, a combined interrupt is available each channel. Original event sources of combined interrupt are maskable by NS_GPT_INTMSKn (n = 0 to 25) register and S_GPT_INTMSKn (n = 0, 1) register, and status of the event sources is capturable to identify the event source which causes assert of the combined interrupt. Figure 12.2 shows the diagram of GPT/MTU3 event selector (GPT_SEL). GPT/MTU3 selected interrupt can be selected for CPU/DMAC interrupt and ELC source separately.

Encoder interface (ENCIF) events are selectable from 5 modules to 1 module each unit by setting ENCIF_ENCSELn (n = 0, 1) register. Figure 12.3 shows the diagram of ENCIF event selector (ENCIF_SEL).

Assignment of the event source to Cortex-R52 GIC SPI is partially fixed and partially selectable. SELECT0_IRQ[159:0] for CPU0 and SELECT1_IRQ[159:0] for CPU1 are assigned as selectable events via Cortex-R52 SPI event selectors (CR520_SEL and CR521_SEL). Its assignment is set by CR520_INTSELn (n =0 to 79) register and CR521_INTSELn (n = 0 to 79) register. Assignment to Cortex-A55 GIC-600 SPI is fixed for all events. Figure 12.4 shows the interrupt connection diagram.

Table 12.16 shows the relation between selected interrupts and control register each selector. Table 12.17 shows event table of this LSI. The checked event in the Cortex-A55 GIC-600 SPI, Cortex-R52 CPU0, CPU1 GIC SPI , DMAC Activation Request, and ELC Source columns indicates that there is a connection to the modules. Event number is common to GIC SPI number, DMACn_RSSELi register (n = 0 to 2 and i = 0 to 5), and ELC_SSELn register (n = 0 to 64). Table 12.18 shows Cortex-A55 PPI (Private Peripheral Interrupts) events. Table 12.19 and Table 12.20 show Cortex-R52 CPU0 and CPU1 selectable events, respectively. Table 12.21 shows GPT events to be input to GPT_SEL. Table 12.22 shows ENCIF events to be input to ENCIF_SEL. Event number is not assigned to these events since registers in Table 12.16 are used to select event.

GIC handles these interrupts. When specifying as INTID, add 32 to the SPI Interface number (event number) considering INTID of SGI (0 to 15) and PPI (16 to 31). Regarding to GIC-600 and GIC in Cortex-R52, please refer to the below documents.

12.4.3 Error Events

The ICU handles error events from modules. CA55ERR_STAT, CR520ERR_STAT, CR521ERR_STAT, PERIERR_STATn (n = 0 to 2), DSMIFERR_STATn (n = 0 to 11), and ENCIFERR_STATn (n = 0 to 4) registers show each error status. The ICU captures error events and generates combined interrupt signal CA55_ERR0, CR520_ERR0, CR521_ERR0, PERI_ERR0, DSMIF_ERR0, ENCIF_ERR0 and CA55_ERR1, CR520_ERR1, CR521_ERR1, PERI_ERR1, DSMIF_ERR1, ENCIF_ERR1.

Error events can be disabled by CA55ERR_E0MSK, CR520ERR_E0MSK, CR521ERR_E0MSK, PERIERR_E0MSKn (n = 0 to 2), DSMIFERR_E0MSKn (n = 0 to 11), ENCIFERR_E0MSKn (n = 0 to 4) registers and CA55ERR_E1MSK, CR520ERR_E1MSK, CR521ERR_E1MSK, PERIERR_E1MSKn (n = 0 to 2), DSMIFERR_E1MSKn (n = 0 to 11), ENCIFERR_E1MSKn (n = 0 to 4) registers.

Additionally, error events can cause the error reset. Error events that cause error reset are maskable in CA55ERR_RSTMSK, CR520ERR_RSTMSK, CR521ERR_RSTMSK, PERIERR_RSTMSKn (n = 0 to 2), DSMIFERR_RSTMSKn (n = 0 to 11), ENCIFERR_RSTMSKn (n = 0 to 4) registers.

All error events are masked as initial values. *ERR_STAT register is not subject to initialization by Error reset. Since it is not initialized, Error will occur again if the Error reset mask is released. If it returns to normal operation after Error reset, it is necessary to confirm error status and clear error flag after restarting.

Table 12.23 shows the relation among error control registers and combined interrupts. Table 12.24 to Table 12.27 show error events.

Table 12.23 Relation among error control registers and combined interrupts

Module	Error Event Status register	Error Event Status Clear register	Error Event Mask register	Combined interrupt
Cortex-A55, GIC-600	CA55ERR_STAT	CA55ERR_CLR	CA55ERR_E0MSK	CA55_ERR0
			CA55ERR_E1MSK	CA55_ERR1
			CA55ERR_RSTMSK	Error reset
Cortex-R52 CPU0	CR520ERR_STAT	CR520ERR_CLR	CR520ERR_E0MSK	CR520_ERR0
			CR520ERR_E1MSK	CR520_ERR1
			CR520ERR_RSTMSK	Error reset
Cortex-R52 CPU1	CR521ERR_STAT	CR521ERR_CLR	CR521ERR_E0MSK	CR521_ERR0
			CR521ERR_E1MSK	CR521_ERR1
			CR521ERR_RSTMSK	Error reset
Peripheral modules except DSMIF and ENCIF (n = 0 to 2)	PERIERR_STATn	PERIERR_CLRn	PERIERR_E0MSKn	PERI_ERR0
			PERIERR_E1MSKn	PERI_ERR1
			PERIERR_RSTMSKn	Error reset
DSMIF (n = 0 to 11)	DSMIFERR_STATn	DSMIFERR_CLRn	DSMIFERR_E0MSKn	DSMIF_ERR0
			DSMIFERR_E1MSKn	DSMIF_ERR1
			DSMIFERR_RSTMSKn	Error reset
ENCIF (n = 0 to 4)	ENCIFERR_STATn	ENCIFERR_CLRn	ENCIFERR_E0MSKn	ENCIF_ERR0
			ENCIFERR_E1MSKn	ENCIF_ERR1
			ENCIFERR_RSTMSKn	Error reset

Table 12.24 CPU error event table (1 of 4)

Module	UNIT	Core	Name	Interrupt sources	Bit of CA55ERR_XXX	Bit of CR520ERR_XXX	Bit of CR521ERR_XXX

12.4.4 External Pin Interrupts

Selectable interrupt detection method and digital noise filter function are available in external pins like IRQ0 to IRQ15, SEI, and DREQ. Low level, rising edge, falling edge, or both edge detection methods are selectable by S_PORTNF_MD register and NS_PORTNF_MD register each pin.

Digital noise filter has the following features:

- Sampling clock cycle is selectable from 64 divisions, 32 divisions, 8 divisions, or 1 division for PCLKM by S_PORTNF_CLKSEL and NS_PORTNF_CLKSEL register.
- Pulses with levels that only match once or twice are removed.

Digital noise filters are desirable for all signals as initial value. Set S_PORTNF_FLTSEL and NS_PORTNF_FLTSEL when using digital noise filter.

Figure 12.5 shows an example of digital noise filter operation.

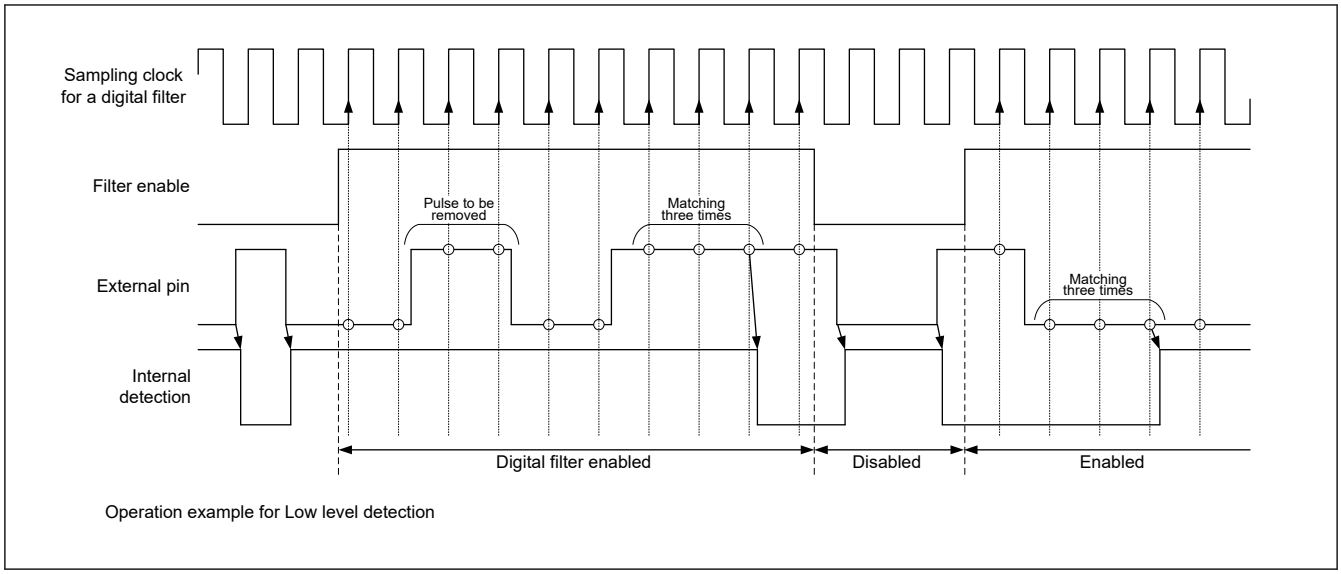

Figure 12.5 Digital noise filter operation example

13. Internal Buses

13.1 Overview

The LSI contains internal main bus A and R, low latency peripheral port bus, and multiple peripheral buses. Master MPUs are implemented for bus masters except the Cortex-R52 and Cortex-A55 so that access to the bus slaves can be controlled by the Cortex-R52 and Cortex-A55. Additionally, physical paths to the bus slaves are separated among some peripherals. It allows CPU access to avoid access conflict from bus masters except the Cortex-R52 and Cortex-A55 physically. TrustZone filters are implemented for bus masters and slaves. TrustZone Master (TZM) can control attribute of the transaction from the master. TrustZone Slave (TZS) can filter the transaction by security level. Table 13.1 lists the specifications of internal buses and Figure 13.1 shows the internal bus configuration.

Table 13.1 Internal buses specifications (1 of 2)

Internal bus type		Description
Internal main bus A	• Bus masters Cortex-A55 ACEM, GMAC (unit 1, 2), PCIE (unit 0, 1), USBHC, USBf, SDHI (unit 0, 1), LCDC, CoreSight ETR, internal main bus R (Cortex-R52 CPU0 and CPU1 AXIM, DMAC (unit 0 to 2), CoreSight AXI-AP)	• Operates in synchronization with PCLKAH • Bus protocol: AMBA AXI • Priority order decision: Round-robin
Internal main bus R	• Bus masters Cortex-A55 PP, Cortex-R52 CPU0 and CPU1 AXIM, DMAC (unit 0 to 2), GMAC (unit 0), SHOSTIF, CoreSight AXI-AP, internal main bus A (Cortex-A55 ACEM, GMAC (unit 1, 2), PCIE (unit 0, 1), USBHC, USBf, SDHI (unit 0, 1), CoreSight ETR)	• Operates in synchronization with PCLKH • Bus protocol: AMBA AXI • Priority order decision: Round-robin
Low latency peripheral port bus	• Bus masters Cortex-R52 CPU0 and CPU1 LLPP, internal main bus R (Cortex-A55 PP, DMAC (unit 0 to 2), PCIE (unit 0, 1), CoreSight AXI-AP)	• Operates in synchronization with PCLKH • Bus protocol: AMBA AXI • Priority order decision: Fixed priority LLPP0: Cortex-R52 CPU0 > Cortex-R52 CPU1 > internal main bus LLPP1: Cortex-R52 CPU1 > Cortex-R52 CPU0 > internal main bus
Peripheral bus R0	MTU3, POE3, GPT (unit 0 to 5), POEG (unit 0), TFU (unit 0), DSMIF (unit 0 to 5), ADC12 (unit 0, 1), ENCIFSS (ENDAT, BISS, HDSL, AFMT) (unit 0 to 11), ENCOUT, SCIE (unit 0 to 7)	• LLPP peripheral (LLPP0) • Operates in synchronization with PCLKH
Peripheral bus R1	GPT (unit 6 to 8), TFU (unit 1), DSMIF (unit 6 to 9), ADC12 (unit 0, 1), ENCIFSS (ENDAT, BISS, HDSL, AFMT) (unit 12 to 15), SCIE (unit 8 to 11)	• LLPP peripheral (LLPP1) • Operates in synchronization with PCLKH
Peripheral bus R2	GPT (unit 9), SCI (unit 0 to 4), SPI (unit 0 to 2), CRC (unit 0), CANFD	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKM
Peripheral bus R3	CMT, CMTW, WDT (unit 0 to 5), IIC (unit 0, 1), DOC, ADC12 (unit 2), TSU, POEG (unit 1)	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKL
Peripheral bus R4	GPT (unit 10), SCI (unit 5), SPI (unit 3), CRC (unit 1)	• Safety peripheral (SAFETY) • Operates in synchronization with PCLKM
Peripheral bus R5	IIC (unit 2), RTC, POEG (unit 2)	• Safety peripheral (SAFETY) • Operates in synchronization with PCLKL
Peripheral bus R6	DMAC (unit 0 to 2), GIC600	• Operates in synchronization with PCLKH
Peripheral bus R7	GMAC (unit 0), ETHSS, ETHSW, ESC	• Operates in synchronization with PCLKM
Cortex-R52 CPU0 AXIS	Cortex-R52 CPU0 ATCM, BTCM	• Operates in synchronization with PCLKH
Cortex-R52 CPU1 AXIS	Cortex-R52 CPU1 ATCM, BTCM	• Operates in synchronization with PCLKH
BSC	• External memory space • Related registers	• Operates in synchronization with PCLKH
xSPI	• External memory space • Related registers	• Operates in synchronization with PCLKH

Table 13.1 Internal buses specifications (2 of 2)

Internal bus type		Description
System SRAM	• System SRAM memory space • Related registers	• Operates in synchronization with PCLKH
System Control	ICU, ELC, clock controller, reset controller, master MPU, address expander, TZC-400	• Operates in synchronization with PCLKM
IO Port	Non-safety IO, Safety IO	• Operates in synchronization with PCLKM
USB	USBHC, USBf	• Operates in synchronization with PCLKAM
PCIE	• External memory space • Related registers	• Operates in synchronization with PCLKAH
DDR memory area	A0 I/F: For access from SDHI (unit 0, 1), LCDC A1 I/F: For access from GMAC (unit 1, 2), PCIE (unit 0, 1), USBHC, USBf, CoreSight ETR A4 I/F: For access from Cortex-A55 ACEM R2 I/F: For access from DMAC (unit 0 to 2), GMAC (unit 0), CoreSight AXI-AP R3 I/F: For access from Cortex-R52 CPU0 and CPU1 AXIM	• A0, A1, A4 I/F: Operates in synchronization with PCLKAH • R2, R3 I/F: Operates in synchronization with PCLKH
DDR Control		• Operates in synchronization with PCLKL
GMAC (unit 1, 2)		• Operates in synchronization with PCLKAM
SDHI		• Operates in synchronization with PCLKAM
LCDC		• Operates in synchronization with PCLKAL
SHOSTIF		• Operates in synchronization with PCLKH
MBXSEM		• Operates in synchronization with PCLKH
OTP		• Operates in synchronization with PCLKM
Security		• Operates in synchronization with PCLKH
CoreSight		• Operates in synchronization with PCLKH
Boot ROM		• Operates in synchronization with PCLKH

13.3 Register Descriptions

13.3.1 STADDm : Master MPU Safety Region Start Address Register m (m = 0 to 15)

Base address: MPUi = 0x8129_1400 + 0x0100 × i (i = 0 to 9)
MPUj = 0x8129_0400 + 0x0100 × (j - 10) (j = 10 to 15)

Offset address: 0x00 + 0x08 × m

Bit	Symbol	Function	R/W
0	RDPR	Enable read protection for region m of master MPU 0: Disable read protection. Read access to the safety region is permitted. 1: Enable read protection. Read access to the safety region is protected and error is generated.	R/W
1	WRPR	Enable write protection for region m of master MPU 0: Disable write protection. Write access to the safety region is permitted. 1: Enable write protection. Write access to the safety region is protected and error is generated.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
6:4	STADDR2[2:0]*2	Start address for MPU region Set upper 3 bits of the 35-bit start address of the safety region to be protected access. 35-bit address master (i = 7 to 9, and 15) only.	R/W
9:7	—	These bits are read as 0. The write value should be 0.	R/W
31:10	STADDR[21:0]	Start address for MPU region Set upper 22 bits of the 32-bit start address of the safety region to be protected access. Lower 10 bits of the 32-bit start address is set 0x000 automatically. For AXI type MPU (i = 0, 1, 4 to 13, and 15), STADDR[1:0] must be set 00b.	R/W

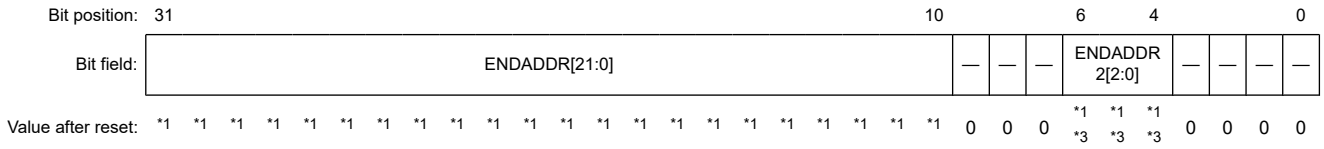
Note 1. Initial value depends on the number of m. The value is 1 for m = 0 and 0 for the others.
Note 2. i = 7 to 9, and 15 only. Reserved for the other.

The STADDm register is a 32-bit register that controls the start address of the safety region. Access from the master module to the safety region which is specified is protected by the master MPU. Up to 16 regions (m = 0 to 15) can be defined for each master MPU. Boundary and granularity of the start address to be set is 1 KB for AHB type MPU (i = 2, 3, and 14) and 4 KB for AXI type MPU (i = 0, 1, 4 to 13, and 15).

13.3.2 ENDADDm : Master MPU Safety Region End Address Register m (m = 0 to 15)

Base address: MPUi = 0x8129_1400 + 0x0100 × i (i = 0 to 9)
MPUj = 0x8129_0400 + 0x0100 × (j - 10) (j = 10 to 15)

Offset address: 0x04 + 0x08 × m



Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
6:4	ENDADDR2[2:0]*2	End address for MPU region Set upper 3 bits of the 35-bit end address of the safety region to be protected access. 35-bit address master (i = 7 to 9, and 15) only.	R/W
9:7	—	These bits are read as 0. The write value should be 0.	R/W
31:10	ENDADDR[21:0]	End address for MPU region Set upper 22 bits of the 32-bit end address of the safety region to be protected access. Lower 10 bits of the 32-bit end address is set 0x3FF automatically. For AXI type MPU (i = 0, 1, 4 to 13, and 15), ENDADDR[1:0] must be set 11b.	R/W

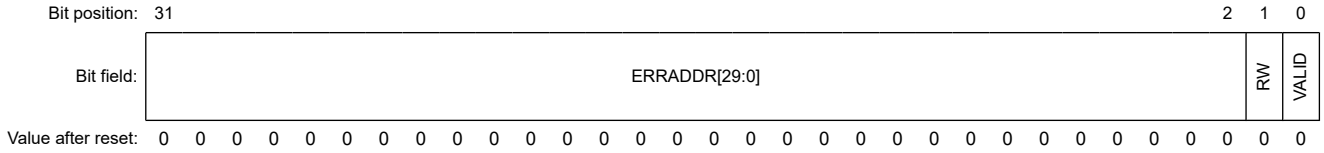
Note 1. Initial value depends on the number of m. The value is 1 for m = 0 and 0 for the others.
Note 2. The ENDADDR2[2:0] bits are available when the base address is MPU7 to MPU9 and MPU15. When the base address is other than MPU7 to MPU9 and MPU15, the ENDADDR2[2:0] bits are reserved.
Note 3. When the base address is MPU0 to MPU6 and MPU10 to MPU14, the initial value of the ENDADDR2[2:0] bits is 000b regardless of the number of m.

The ENDADDm register is a 32-bit register that controls the end address of the safety region. Access from the master module to the safety region which is specified is protected by the master MPU. Up to 16 regions (m = 0 to 15) can be defined for each master MPU. Boundary and granularity of the end address to be set is 1 KB for AHB type MPU (i = 2, 3, and 14) and 4 KB for AXI type MPU (i = 0, 1, 4 to 13, and 15).

13.3.3 ERRINF : Master MPU Error Information Register for AHB type

Base address: MPUi = 0x8129_1400 + 0x0100 × i (i = 2, 3)
MPU14 = 0x8129_0800

Offset address: 0x80



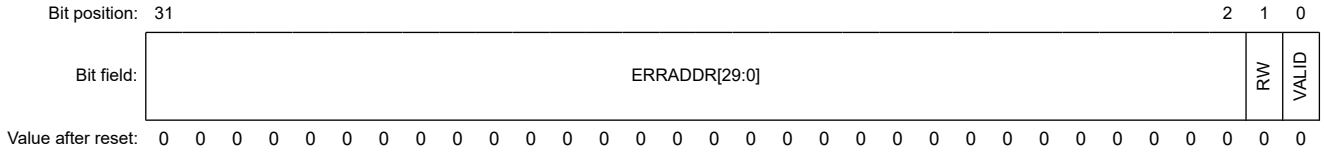
Bit	Symbol	Function	R/W
0	VALID	Validity of Access Error Information Cleared to 0 when 0 is written. 0: Error information is invalid 1: Error information is valid	R/W
1	RW	Access error type 0: Read access 1: Write access	R
31:2	ERRADDR[29:0]	Access Error Address Indicates upper 30 bits of the 32-bit address. Lower 2 bits are masked.	R

The ERRINF is a 32-bit register to store the safety region access error information by master module. AHB type MPUi (i = 2, 3, and 14) provides one error information for both read and write.

13.3.4 ERRINF_x : Master MPU Error Information Register for AXI type (x = R, W)

Base address: MPUi = 0x8129_1400 + 0x0100 × i (i = 0, 1, 4 to 9)
MPUj = 0x8129_0400 + 0x0100 × (j - 10) (j = 10 to 13)
MPU15 = 0x8129_0900

Offset address: 0x80 (ERRINF_R)
0x84 (ERRINF_W)



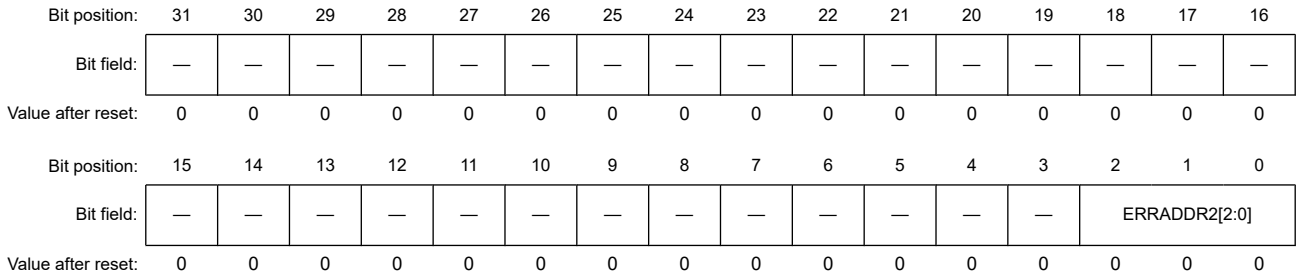
Bit	Symbol	Function	R/W
0	VALID	Validity of access error information Cleared to 0 when 0 is written. 0: Error information is invalid 1: Error information is valid	R/W
1	RW	Access error type 0: Read access 1: Write access	R
31:2	ERRADDR[29:0]	Access error address Indicates upper 30 bits of the 32-bit address. Lower 2 bits are masked.	R

The ERRINF_x register is a 32-bit register to store the safety region access error information by master module. AXI type MPUi (i = 0 to 2, and 6) provides error information for each read and write channel separately. ERRINF_R is for read channel and ERRINF_W is for write channel.

13.3.5 ERRINF1_x : Master MPU Error Information Register for AXI type 1 (x = R, W)

Base address: MPUi = 0x8129_1400 + 0x0100 × i (i = 7 to 9)
MPU15 = 0x8129_0900

Offset address: 0x88 (ERRINF1_R)
0x8C (ERRINF1_W)



Bit	Symbol	Function	R/W
2:0	ERRADDR2[2:0]	Access error address. Indicates upper 3 bits of the 35-bit address.	R
31:3	—	These bits are read as 0.	R

The ERRINF1_x register is a 32-bit register to store the safety region access error information by master module. AXI type MPUi (i = 7 to 9, and 15) provides upper 3 bits of 35-bit error information for each read and write channel separately. ERRINF1_R is for read channel and ERRINF1_W is for write channel.

13.3.6 CPU_CTRL : CPU Access Permission Control Register

Base address: MPU_AC = 0x8124_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CA553_CTRL	CA552_CTRL	CA551_CTRL	CA550_CTRL	—	—	—	—	—	—	—	CR521_CTRL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CR521_CTRL	Cortex-R52 CPU1 access permission control to Master MPU related registers 0: Access prohibited 1: Access permitted	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	CA550_CTRL	Cortex-A55 Core0 access permission control to Master MPU related registers 0: Access prohibited 1: Access permitted	R/W
9	CA551_CTRL	Cortex-A55 Core1 access permission control to Master MPU related registers 0: Access prohibited 1: Access permitted	R/W
10	CA552_CTRL	Cortex-A55 Core2 access permission control to Master MPU related registers 0: Access prohibited 1: Access permitted	R/W
11	CA553_CTRL	Cortex-A55 Core3 access permission control to Master MPU related registers 0: Access prohibited 1: Access permitted	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

The CPU_CTRL register is used to control access from Cortex-R52 CPU1 and Cortex-A55 to Master MPU related registers.

13.3.7 SSTPCR0 : Slave Stop Control Register 0

Base address: SSC = 0x8129_0200

Offset address: 0x1000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DDRA4_ACK	DDRA4_REQ	—	—	DDRA1_ACK	DDRA1_REQ	—	—	DDRA0_ACK	DDRA0_REQ
Value after reset:	0	0	0	0	0	0	1	1	0	0	1	1	0	0	1	1

Bit	Symbol	Function	R/W
0	DDRA0_REQ	DDRSS A0 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W

Bit	Symbol	Function	R/W
1	DDRA0_ACK	DDRSS A0 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DDRA1_REQ	DDRSS A1 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
5	DDRA1_ACK	DDRSS A1 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	DDRA4_REQ	DDRSS A4 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
9	DDRA4_ACK	DDRSS A4 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
31:10	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR0 register controls the slave bus stop state in main bus A. This register is available in Safety region.

13.3.8 SSTPCR1 : Slave Stop Control Register 1

Base address: SSC = 0x8129_0200

Offset address: 0x1004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	SDHI1_ACK	SDHI1_REQ	—	—	SDHI0_ACK	SDHI0_REQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	PCIE1_ACK	PCIE1_REQ	—	—	PCIE0_ACK	PCIE0_REQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	1

Bit	Symbol	Function	R/W
0	PCIE0_REQ	PCIE0 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
1	PCIE0_ACK	PCIE0 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PCIE1_REQ	PCIE1 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
5	PCIE1_ACK	PCIE1 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
15:6	—	These bits are read as 0. The write value should be 0.	R/W
16	SDHI0_REQ	SDHI0 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W

Bit	Symbol	Function	R/W
17	SDHI0_ACK	SDHI0 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
19:18	—	These bits are read as 0. The write value should be 0.	R/W
20	SDHI1_REQ	SDHI1 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
21	SDHI1_ACK	SDHI1 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
31:22	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR1 register controls the slave bus stop state in main bus A. This register is available in Safety region.

13.3.9 SSTPCR4 : Slave Stop Control Register 4

Base address: SSC = 0x8129_0200

Offset address: 0x0000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DDRAPB	—	—	DDRR3_ACK	DDRR3_REQ	—	—	DDRR2_ACK	DDRR2_REQ
Value after reset:	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1	1

Bit	Symbol	Function	R/W
0	DDRR2_REQ	DDRSS R2 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
1	DDRR2_ACK	DDRSS R2 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DDRR3_REQ	DDRSS R3 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
5	DDRR3_ACK	DDRSS R3 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	DDRAPB	DDR APB I/F Stop Control 0: Normal operation 1: Stop	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR4 register controls the slave bus stop state in main bus R. This register is available in Safety region.

13.3.10 SSTPCR5 : Slave Stop Control Register 5

Base address: SSC = 0x8129_0200

Offset address: 0x0004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GIC600_ACK	GIC600_REQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	GIC600_REQ	GIC600 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
17	GIC600_ACK	GIC600 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR5 register controls the slave bus stop state in main bus R. This register is available in Safety region.

13.3.11 SSTPCR6 : Slave Stop Control Register 6

Base address: SSC = 0x8129_0200

Offset address: 0x0008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	XSPI1_ACK	XSPI1_REQ	—	—	XSPI0_ACK	XSPI0_REQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	1

Bit	Symbol	Function	R/W
0	XSPI0_REQ	XSPI0 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
1	XSPI0_ACK	XSPI0 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	XSPI1_REQ	XSPI1 I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W

Bit	Symbol	Function	R/W
5	XSPI1_ACK	XSPI1 I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR6 register controls the slave bus stop state in main bus R. This register is available in Safety region.

13.3.12 SSTPCR7 : Slave Stop Control Register 7

Base address: SSC = 0x8129_0200

Offset address: 0x000C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	AXIS1_ACK	AXIS1_REQ	—	—	AXIS0_ACK	AXIS0_REQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0

Bit	Symbol	Function	R/W
0	AXIS0_REQ	Cortex-R52 CPU0 AXIS I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
1	AXIS0_ACK	Cortex-R52 CPU0 AXIS I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	AXIS1_REQ	Cortex-R52 CPU1 AXIS I/F Bus Stop Request 0: Normal operation 1: Bus Stop Request	R/W
5	AXIS1_ACK	Cortex-R52 CPU1 AXIS I/F Bus Stop Acknowledge 0: Normal operation 1: Bus Stop Acknowledge	R
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The SSTPCR7 register controls the slave bus stop state in main bus R. This register is available in Safety region.

13.3.13 MSTACCCTL0 : Master Access Control Register 0

Base address: MSAC = 0x8129_0300

Offset address: 0x1000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GMAC2_SEL1x	GMAC2_SEL0	GMAC2_PROT1	GMAC2_PROT0	GMAC1_SEL1	GMAC1_SEL0	GMAC1_PROT1	GMAC1_PROT0	SDHI1_SEL1	SDHI1_SEL0	SDHI1_PROT1	SDHI1_PROT0	SDHI0_SEL1	SDHI0_SEL0	SDHI0_PROT1	SDHI0_PROT0
Value after reset:	1	1	1	0	1	1	1	0	1	1	1	0	1	1	1	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PCIE1_SEL1	PCIE1_SEL0	PCIE1_PROT1	PCIE1_PROT0	PCIE0_SEL1	PCIE0_SEL0	PCIE0_PROT1	PCIE0_PROT0	LCDC_SEL1	LCDC_SEL0	LCDC_PROT1	LCDC_PROT0	CSETR_SEL1	CSETR_SEL0	CSETR_PROT1	CSETR_PROT0
Value after reset:	1	1	1	0	1	1	1	0	1	1	1	0	1	1	1	0

Bit	Symbol	Function	R/W
0	CSETR_PROT0	CS ETR Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
1	CSETR_PROT1	CS ETR Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
2	CSETR_SEL0	CS ETR Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by CSETR_PROT0	R/W
3	CSETR_SEL1	CS ETR Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by CSETR_PROT1	R/W
4	LCDC_PROT0	LCDC Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
5	LCDC_PROT1	LCDC Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
6	LCDC_SEL0	LCDC Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by LCDC_PROT0	R/W
7	LCDC_SEL1	LCDC Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by LCDC_PROT1	R/W
8	PCIE0_PROT0	PCIE0 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
9	PCIE0_PROT1	PCIE0 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
10	PCIE0_SEL0	PCIE0 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by PCIE0_PROT0	R/W
11	PCIE0_SEL1	PCIE0 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by PCIE0_PROT1	R/W
12	PCIE1_PROT0	PCIE1 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
13	PCIE1_PROT1	PCIE1 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
14	PCIE1_SEL0	PCIE1 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by PCIE1_PROT0	R/W
15	PCIE1_SEL1	PCIE1 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by PCIE1_PROT1	R/W
16	SDHI0_PROT0	SDHI0 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
17	SDHI0_PROT1	SDHI0 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W

Bit	Symbol	Function	R/W
18	SDHI0_SEL0	SDHI0 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by SDHI0_PROT0	R/W
19	SDHI0_SEL1	SDHI0 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by SDHI0_PROT1	R/W
20	SDHI1_PROT0	SDHI1 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
21	SDHI1_PROT1	SDHI1 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
22	SDHI1_SEL0	SDHI1 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by SDHI1_PROT0	R/W
23	SDHI1_SEL1	SDHI1 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by SDHI1_PROT1	R/W
24	GMAC1_PROT0	GMAC1 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
25	GMAC1_PROT1	GMAC1 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
26	GMAC1_SEL0	GMAC1 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC1_PROT0	R/W
27	GMAC1_SEL1	GMAC1 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC1_PROT1	R/W
28	GMAC2_PROT0	GMAC2 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
29	GMAC2_PROT1	GMAC2 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
30	GMAC2_SEL0	GMAC2 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC2_PROT0	R/W
31	GMAC2_SEL1x	GMAC2 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC2_PROT1	R/W

The MSTACCCTL0 register is used to select the secure attribute and privilege attribute of transactions from master.

13.3.14 MSTACCCTL1 : Master Access Control Register 1

Base address: MSAC = 0x8129_0300

Offset address: 0x1004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	USB_SEL	—	USB_PROT1	USB_PROT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Function	R/W
0	USB_PROT0	USB Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
1	USB_PROT1	USB Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
2	—	This bit is read as 1. The write value should be 1.	R/W
3	USB_SEL	USB Security Attribute (HNONSEC) and Privilege Attribute (HPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by USB_PROT[1:0]	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MSTACCCTL1 register is used to select the secure attribute and privilege attribute of transactions from master.

13.3.15 MSTACCCTL2 : Master Access Control Register 2

Base address: MSAC = 0x8129_0300

Offset address: 0x0000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CR521_SEL1x	CR521_SEL0	CR521_PROT1	CR521_PROT0	CR520_SEL1	CR520_SEL0	CR520_PROT1	CR520_PROT0	DMAC2_SEL1	DMAC2_SEL0	DMAC2_PROT1	DMAC2_PROT0	DMAC1_SEL1	DMAC1_SEL0	DMAC1_PROT1	DMAC1_PROT0
Value after reset:	0	0	1	0	1	1	0	1	1	1	1	0	1	1	1	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMAC0_SEL1	DMAC0_SEL0	DMAC0_PROT1	DMAC0_PROT0	—	—	—	—	GMAC0_SEL1	GMAC0_SEL0	GMAC0_PROT1	GMAC0_PROT0	CSAXIAP_SEL1	CSAXIAP_SEL0	CSAXIAP_PROT1	CSAXIAP_PROT0
Value after reset:	1	1	1	0	0	0	0	0	1	1	1	0	1	1	1	0

Bit	Symbol	Function	R/W
0	CSAXIAP_PROT0	CS AXI-AP Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
1	CSAXIAP_PROT1	CS AXI-AP Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W

Bit	Symbol	Function	R/W
2	CSAXIAP_SEL0	CS AXI-AP Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by CSAXIAP_PROT0	R/W
3	CSAXIAP_SEL1	CS AXI-AP Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by CSAXIAP_PROT1	R/W
4	GMAC0_PROT0	GMAC0 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
5	GMAC0_PROT1	GMAC0 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
6	GMAC0_SEL0	GMAC0 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC0_PROT0	R/W
7	GMAC0_SEL1	GMAC0 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by GMAC0_PROT1	R/W
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	DMAC0_PROT0	DMAC0 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
13	DMAC0_PROT1	DMAC0 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
14	DMAC0_SEL0	DMAC0 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC0_PROT0	R/W
15	DMAC0_SEL1	DMAC0 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC0_PROT1	R/W
16	DMAC1_PROT0	DMAC1 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
17	DMAC1_PROT1	DMAC1 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
18	DMAC1_SEL0	DMAC1 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC1_PROT0	R/W
19	DMAC1_SEL1	DMAC1 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC1_PROT1	R/W
20	DMAC2_PROT0	DMAC2 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
21	DMAC2_PROT1	DMAC2 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
22	DMAC2_SEL0	DMAC2 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC2_PROT0	R/W
23	DMAC2_SEL1	DMAC2 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by DMAC2_PROT1	R/W

Bit	Symbol	Function	R/W
24	CR520_PROT0	CR520 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
25	CR520_PROT1	CR520 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
26	CR520_SEL0	CR520 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by CR520_PROT0	R/W
27	CR520_SEL1	CR520 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by CR520_PROT1	R/W
28	CR521_PROT0	CR521 Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
29	CR521_PROT1	CR521 Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
30	CR521_SEL0	CR521 Privilege Attribute (AxPROT[0]) Overwrite Select 0: No overwrite 1: Overwritten by CR521_PROT0	R/W
31	CR521_SEL1x	CR521 Security Attribute (AxPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by CR521_PROT1	R/W

The MSTACCCTL2 register is used to select the secure attribute and privilege attribute of transactions from master.

13.3.16 MSTACCCTL3 : Master Access Control Register 3

Base address: MSAC = 0x8129_0300

Offset address: 0x0004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	SHOSTIF_SEL	—	SHOSTIF_PROT1	SHOSTIF_PROT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Function	R/W
0	SHOSTIF_PROT0	SHOSTIF Privilege Attribute Overwrite 0: Unprivileged 1: Privileged	R/W
1	SHOSTIF_PROT1	SHOSTIF Security Attribute Overwrite 0: Secure 1: Non-Secure	R/W
2	—	This bit is read as 1. The write value should be 1.	R/W
3	SHOSTIF_SEL	SHOSTIF Security Attribute (HNONSEC) and Privilege Attribute (HPROT[1]) Overwrite Select 0: No overwrite 1: Overwritten by SHOSTIF_PROT[1:0]	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MSTACCCTL3 register is used to select the secure attribute and privilege attribute of transactions from master.

13.3.17 SLVACCCTL0 : Slave Access Control Register 0

Base address: MSAC = 0x8129_0300

Offset address: 0x1010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ADC2_SL[1:0]		—	—	WDT5_SL[1:0]		WDT4_SL[1:0]		WDT3_SL[1:0]		WDT2_SL[1:0]		WDT1_SL[1:0]		WDT0_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	POEG1_SL[1:0]		GPT09_SL[1:0]		—	—	CMTW1_SL[1:0]		CMTW0_SL[1:0]		CMT2_SL[1:0]		CMT1_SL[1:0]		CMT0_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CMT0_SL[1:0]	CMT Unit 0 Security Level	R/W
3:2	CMT1_SL[1:0]	CMT Unit 1 Security Level	R/W
5:4	CMT2_SL[1:0]	CMT Unit 2 Security Level	R/W
7:6	CMTW0_SL[1:0]	CMTW Unit 0 Security Level	R/W
9:8	CMTW1_SL[1:0]	CMTW Unit 1 Security Level	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	GPT09_SL[1:0]	GPT Unit 09 Security Level	R/W
15:14	POEG1_SL[1:0]	POEG Unit 1 Security Level	R/W
17:16	WDT0_SL[1:0]	WDT Unit 0 Security Level	R/W
19:18	WDT1_SL[1:0]	WDT Unit 1 Security Level	R/W
21:20	WDT2_SL[1:0]	WDT Unit 2 Security Level	R/W
23:22	WDT3_SL[1:0]	WDT Unit 3 Security Level	R/W
25:24	WDT4_SL[1:0]	WDT Unit 4 Security Level	R/W
27:26	WDT5_SL[1:0]	WDT Unit 5 Security Level	R/W
29:28	—	These bits are read as 0. The write value should be 0.	R/W
31:30	ADC2_SL[1:0]	ADC Unit 2 Security Level	R/W

The SLVACCCTL0 register is used to select the security level of the slaves.

13.3.18 SLVACCCTL1 : Slave Access Control Register 1

Base address: MSAC = 0x8129_0300

Offset address: 0x1014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TSU_SL[1:0]		CRC0_SL[1:0]		DOC_SL[1:0]		CANFD_SL[1:0]		—	—	SPI2_SL[1:0]		SPI1_SL[1:0]		SPI0_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	IIC1_SL[1:0]		IIC0_SL[1:0]		—	—	SCI4_SL[1:0]		SCI3_SL[1:0]		SCI2_SL[1:0]		SCI1_SL[1:0]		SCI0_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SCI0_SL[1:0]	SCI Unit 0 Security Level	R/W
3:2	SCI1_SL[1:0]	SCI Unit 1 Security Level	R/W
5:4	SCI2_SL[1:0]	SCI Unit 2 Security Level	R/W
7:6	SCI3_SL[1:0]	SCI Unit 3 Security Level	R/W
9:8	SCI4_SL[1:0]	SCI Unit 4 Security Level	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	IIC0_SL[1:0]	IIC Unit 0 Security Level	R/W
15:14	IIC1_SL[1:0]	IIC Unit 1 Security Level	R/W
17:16	SPI0_SL[1:0]	SPI Unit 0 Security Level	R/W
19:18	SPI1_SL[1:0]	SPI Unit 1 Security Level	R/W
21:20	SPI2_SL[1:0]	SPI Unit 2 Security Level	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
25:24	CANFD_SL[1:0]	CANFD Security Level	R/W
27:26	DOC_SL[1:0]	DOC Security Level	R/W
29:28	CRC0_SL[1:0]	CRC Unit 0 Security Level	R/W
31:30	TSU_SL[1:0]	TSU Security Level	R/W

The SLVACCCTL1 register is used to select the security level of the slaves.

13.3.19 SLVACCCTL2 : Slave Access Control Register 2

Base address: MSAC = 0x8129_0300

Offset address: 0x1018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	SPI3_SL[1:0]		IIC2_SL[1:0]		SCI5_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CRC1_SL[1:0]		RTC_SL[1:0]		—	—	—	—	POEG2_SL[1:0]		GPT10_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	GPT10_SL[1:0]	GPT Unit 10 Security Level	R/W
3:2	POEG2_SL[1:0]	POEG Unit 2 Security Level	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
9:8	RTC_SL[1:0]	RTC Security Level	R/W
11:10	CRC1_SL[1:0]	CRC Unit 1 Security Level	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
17:16	SCI5_SL[1:0]	SCI Unit 5 Security Level	R/W
19:18	IIC2_SL[1:0]	IIC Unit 2 Security Level	R/W
21:20	SPI3_SL[1:0]	SPI Unit 3 Security Level	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

The SLVACCCTL2 register is used to select the security level of the slaves.

13.3.20 SLVACCCTL4 : Slave Access Control Register 4

Base address: MSAC = 0x8129_0300

Offset address: 0x1020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	GMAC2_SL[1:0]		GMAC1_SL[1:0]		—	—	—	—	SDHI1_SL[1:0]		SDHI0_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LCDC_SL[1:0]		—	—	—	—	—	—	USB_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	USB_SL[1:0]	USB (USBHC and USBf) Security Level	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	LCDC_SL[1:0]	LCDC Security Level	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	SDHI0_SL[1:0]	SDHI0 Unit 0 Security Level	R/W
19:18	SDHI1_SL[1:0]	SDHI1 Unit 1 Security Level	R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
25:24	GMAC1_SL[1:0]	GMAC Unit 1 Security Level	R/W
27:26	GMAC2_SL[1:0]	GMAC Unit 2 Security Level	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The SLVACCCTL4 register is used to select the security level of the slaves.

13.3.21 SLVACCCTL5 : Slave Access Control Register 5

Base address: MSAC = 0x8129_0300

Offset address: 0x1024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MPUGMAC2_SL[1:0]		MPUGMAC1_SL[1:0]		MPUSDHI1_SL[1:0]		MPUSDHI0_SL[1:0]		MPULCDC_SL[1:0]		MPUPCIE1_SL[1:0]		MPUPCIE0_SL[1:0]		MPUUSB_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	TZCPCIE_SL[1:0]		TZCDDRA4_SL[1:0]		TZCDDRA0A1_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0

Bit	Symbol	Function	R/W
1:0	TZCDDRA0A1_SL[1:0]	DDR A0 and A1 I/F TZC-400 Security Level	R/W
3:2	TZCDDRA4_SL[1:0]	DDR A4 I/F TZC-400 Security Level	R/W

15:2	—	These bits are read as 0. The write value should be 0.	R/W
17:16	MPUSHOSTIF_SL[1:0]	SHOSTIF MPU Security Level	R/W
19:18	MPUGMAC0_SL[1:0]	GMAC Unit 0 MPU Security Level	R/W
21:20	MPUDMAC0_SL[1:0]	DMAC Unit 0 MPU Security Level	R/W
23:22	MPUDMAC1_SL[1:0]	DMAC Unit 1 MPU Security Level	R/W
25:24	MPUDMAC2_SL[1:0]	DMAC Unit 2 MPU Security Level	R/W
27:26	MPUCS_SL[1:0]	CS (ETR and AXI-AP) MPU Security Level	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The SLVACCCTL9 register is used to select the security level of the slaves.

13.3.26 ADXCTLn : Address Expander Control Register n (n = 0 to 12)

Base address: ADXC0 = 0x8129_0100 (ADXCTL0 to ADXCTL5)
ADXC1 = 0x8129_1100 (ADXCTL6 to ADXCTL12)

Offset address: 0x00 + 0x04 × n (ADXCTL0 to ADXCTL5)
0x00 + 0x04 × (n - 6) (ADXCTL6 to ADXCTL12)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	DDRMIR1[4:0]					—	—	—	DDRMIR0[4:0]				
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCIE1MIR[4:0]					—	—	—	PCIE0MIR[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	PCIE0MIR[4:0]*1	PCIE0 Mirror Address Specify [32:28] bit of start address of any 256 MB in PCIE0 area (0x4_0000_0000 to 0x5_FFFF_FFFF).	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
12:8	PCIE1MIR[4:0]*1	PCIE1 Mirror Address Specify [32:28] bit of start address of any 256 MB in PCIE1 area (0x6_0000_0000 to 0x7_FFFF_FFFF).	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
20:16	DDRMIR0[4:0]	DDR Mirror Address 0 Specify [32:28] bit of start address of any 512 MB in DDR area (0x2_0000_0000 to 0x3_FFFF_FFFF). 0x1F is prohibited.	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
28:24	DDRMIR1[4:0]	DDR Mirror Address 1 Specify [32:28] bit of start address of any 512 MB in DDR area (0x2_0000_0000 to 0x3_FFFF_FFFF). 0x1F is prohibited.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Valid for n = 0 to 4. Reserved for n = 5 to 12.

The ADXCTLn registers are used to expand address for 32-bit address master to access PCIE and DDR area.

13.4 Operation

13.4.1 Bus Connection

The internal main bus A, R, and low-latency peripheral bus of this LSI have a multiple-layer structure. If bus masters request to access different bus slaves respectively, multiple accesses are processed in parallel. If bus masters request to access the same bus slave, priority order decision is performed and accesses are processed sequentially according to the priority order. Arbitration scheme for internal main bus A and R is round-robin and for low-latency peripheral bus is fixed priority. Priority of access to slaves on low-latency peripheral bus 0 (LLPP0) is fixed to Cortex-R52 CPU0 > Cortex-R52 CPU1 > the other bus masters on internal main bus. Priority of access to slaves on low-latency peripheral bus 1 (LLPP1) is fixed to Cortex-R52 CPU1 > Cortex-R52 CPU0 > the other bus masters on internal main bus.

Table 13.4 lists the connection between the bus masters and the bus slaves.

Table 13.4 Connection between bus masters and bus slaves (A: Accessible, —: Inaccessible)

Bus slave	Bus master

Note 1. Access through internal main bus is available. Priority order for these bus masters is round-robin.
Note 2. GIC600 register are accessible from Cortex-A55 only.
Note 3. Process data RAM on ESC only.
Note 4. Memory space only. Control registers are not accessible.
Note 5. CPU_CTRL register is not accessible.

Note 6. Master MPU related registers are accessible if CPU_CTRL register is set by Cortex-R52 CPU0.

13.4.2 Master MPU

Master MPU (MPUi, (i = 0 to 15)) is used to prevent master modules except the Cortex-R52 and Cortex-A55 from accessing the safety region that is specified by STADDm and ENDADDm registers. When the master MPU detects the access to the safety region, access is terminated with an error response from the bus. Up to 16 regions can be protected for each master module. Boundary of the safety region is set with 1 KB granularity for AHB type MPU and 4 KB for AXI type MPU.

Master MPU stores error address and access attribution (read or write) to the Master MPU Error Information registers (ERRINF, ERRINF_R, ERRINF_W) when access error is detected. Interrupt is also generated to inform the CPU of the error occurrence.

Master MPU registers (STADDm, ENDADDm, ERRINF, and ERRINF_x) can be controlled by Cortex-R52 CPU0, CPU1, and Cortex-A55. After the reset, only Cortex-R52 CPU0 can read and write these registers in case of Cortex-R52 CPU0 boot mode. By setting CPU_CTRL register by Cortex-R52 CPU0, Cortex-R52 CPU1 and Cortex-A55 can also read and write these registers. In case of Cortex-A55 Core0 boot mode, all the CPU can read and write these registers after the reset.

Table 13.5 lists the correspondence between MPUi and the master module. AXI type master MPU monitors access address and stores error address to the registers for read and write channels separately. On the other hand, AHB type master MPU monitors access address and stores error address to the same register for commonly read and write operation.

Table 13.5 Correspondence between master module and error information registers

Master module	Bus	Type	Address size	Error information registers	
				Base address symbol	Register symbol
GMAC Unit 1	A	AXI	32	MPU0	ERRINF_R, ERRINF_W
GMAC Unit 2	A	AXI	32	MPU1	ERRINF_R, ERRINF_W
USB Host	A	AHB	32	MPU2	ERRINF
USB function	A	AHB	32	MPU3	ERRINF
SDHI Unit 0	A	AXI	32	MPU4	ERRINF_R, ERRINF_W
SDHI Unit 1	A	AXI	32	MPU5	ERRINF_R, ERRINF_W
LCD Controller	A	AXI	32	MPU6	ERRINF_R, ERRINF_W
PCIE Unit 0	A	AXI	35	MPU7	ERRINF_R, ERRINF_W, ERRINF1_R, ERRINF1_W
PCIE Unit 1	A	AXI	35	MPU8	ERRINF_R, ERRINF_W, ERRINF1_R, ERRINF1_W
CoreSight ETR	A	AXI	35	MPU9	ERRINF_R, ERRINF_W, ERRINF1_R, ERRINF1_W
DMAC Unit 0	R	AXI	32	MPU10	ERRINF_R, ERRINF_W
DMAC Unit 1	R	AXI	32	MPU11	ERRINF_R, ERRINF_W
DMAC Unit 2	R	AXI	32	MPU12	ERRINF_R, ERRINF_W
GMAC Unit 0	R	AXI	32	MPU13	ERRINF_R, ERRINF_W
SHOSTIF	R	AHB	32	MPU14	ERRINF
CoreSight AXI-AP	R	AXI	35	MPU15	ERRINF_R, ERRINF_W, ERRINF1_R, ERRINF1_W

Safety region that is specified can be overlapped. If different attributions (read protection, write protection, or read/write protection) are set to the same area, combined protection is applied. Figure 13.2 shows an example of the safety region and attribution by the master MPU.

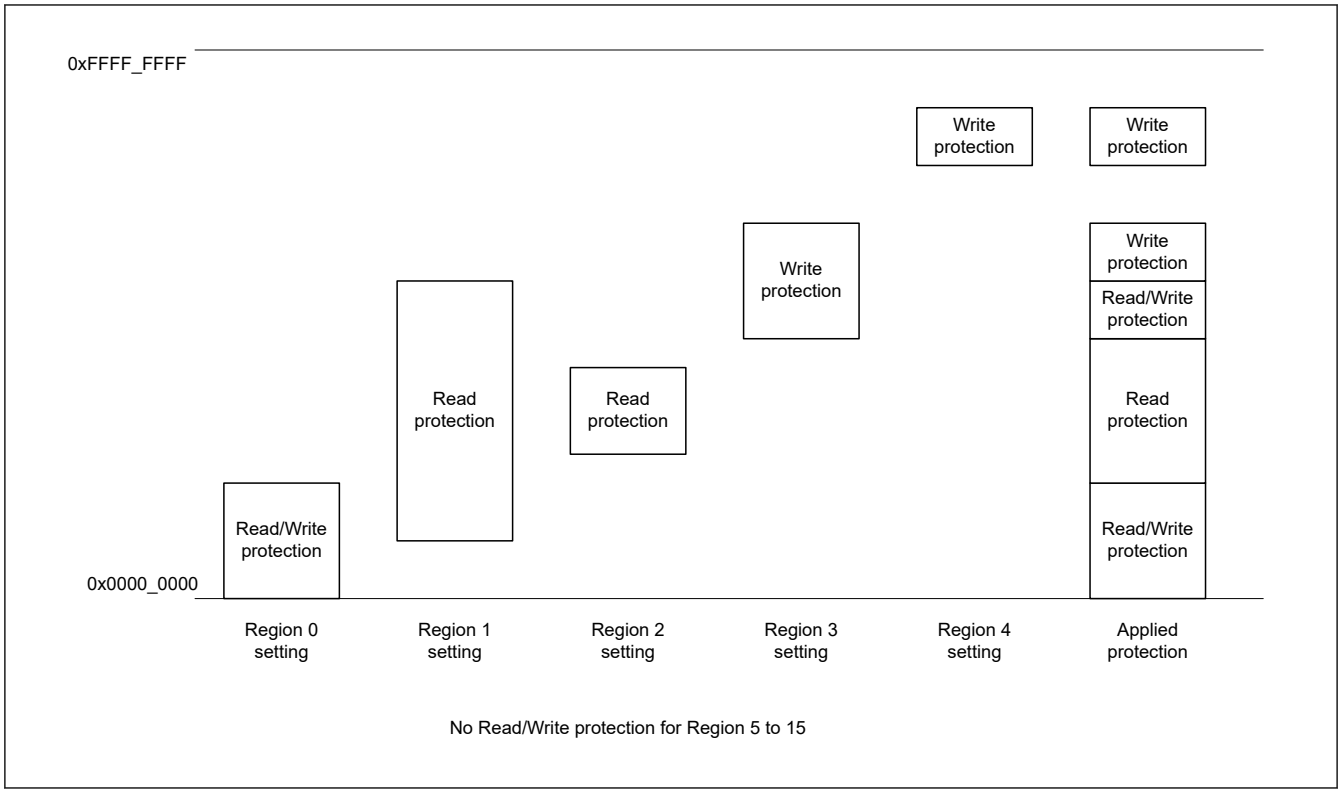

Figure 13.2 Safety region and attribution by master MPU

13.4.3 Slave Stop Function

The slave stop function is used to stop the access to the AXI-type slave I/F safely. Before changing module reset state or module stop state, the access to the slave I/F needs to be stopped by slave stop function. Control procedure is the following.

In case of release from the module reset or module stop state:

1. Release the target slave from the module reset or module stop state by changing corresponding module reset control register or module stop control register.
2. Set xxx_REQ bit in SSTPCRn register to 0. (xxx: target slave name)
3. Polling xxx_ACK bit in SSTPCRn register until it changes to 0.
4. After xxx_ACK bit in SSTPCRn register changes to 0, access to the module is possible.

In case of transition to the module reset or module stop state:

1. Stop operation of target module.
2. Set xxx_REQ bit in SSTPCRn register to 1. (xxx: target slave name)
3. Polling xxx_ACK bit in SSTPCRn register until it changes to 1.
4. After xxx_ACK bit in SSTPCRn register changes to 1, transit the target slave to the module reset or module stop state by changing corresponding module reset control register or module stop control register.

Table 13.6 lists AXI-type slaves supporting slave stop function.

Table 13.6 AXI-type Slaves supporting Slave Stop Function

Bus slave	I/F	Slave Stop Control Register			Related module reset and stop register	
		Register	ACK bit	REQ bit	Module reset	Module stop
DDRSS	A0 I/F	SSTPCR0	DDRA0_ACK	DDRA0_REQ	MRCTLM.[25:16]*1	MSTPCRM.[0]*1
	A1 I/F	SSTPCR0	DDRA1_ACK	DDRA1_REQ		
	A4 I/F	SSTPCR0	DDRA4_ACK	DDRA4_REQ		
	R2 I/F	SSTPCR4	DDRR2_ACK	DDRR2_REQ		
	R3 I/F	SSTPCR4	DDRR3_ACK	DDRR3_REQ		
PCIE unit 0	—	SSTPCR1	PCIE0_ACK	PCIE0_REQ	—	MSTPCRM.[8]*1
PCIE unit 1	—	SSTPCR1	PCIE1_ACK	PCIE1_REQ	—	
SDHI unit 0	—	SSTPCR1	SDHI0_ACK	SDHI0_REQ	—	MSTPCRM.[12]
SDHI unit 1	—	SSTPCR1	SDHI1_ACK	SDHI1_REQ	—	MSTPCRM.[13]

XSPI unit 0	—	SSTPCR6	XSPI0_ACK	XSPI0_REQ	MRCTLA.[4]	MSTPCRA.[4]
XSPI unit 1	—	SSTPCR6	XSPI1_ACK	XSPI1_REQ	MRCTLA.[5]	MSTPCRA.[5]
Cortex-R52 CPU0 AXIS	—	SSTPCR7	AXIS0_ACK	AXIS0_REQ	SWRCPU0	MSTPCRN.[0]
Cortex-R52 CPU1 AXIS	—	SSTPCR7	AXIS1_ACK	AXIS1_REQ	SWRCPU1	MSTPCRN.[1]

Note 1. All the related bits of slave stop control register must be controlled to change this register.

13.4.4 TrustZone Access Control

Arm® TrustZone® technology is a system architecture to separate secure world and non-secure world by hardware and software. Cortex-A55 supports secure and non-secure transaction natively, but other bus masters and bus slaves also need to support handling of secure or non-secure transaction. This LSI implements TrustZone Master (TZM) module, TrustZone Slave (TZS) and TZC-400 to enable those bus masters and slaves support TrustZone in a whole chip.

In addition, this LSI can identify not only secure or non-secure transaction but also privileged or un-privileged transaction to protect illegal access. Figure 13.3 shows the overview of TrustZone access control in this LSI.

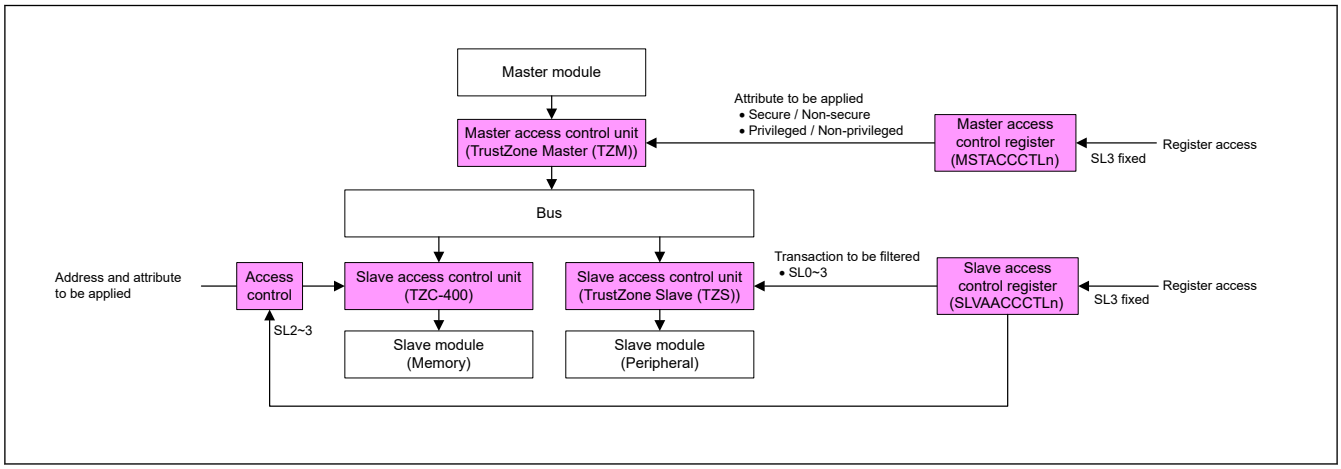

Figure 13.3 Overview of TrustZone access control

13.4.4.1 TrustZone Master (TZM)

TrustZone Master (TZM) provides the function to overwrite attribute of bus transaction issued by bus master according to the master access control register (MSTACCCTLn). xxx_PROT1 and xxx_PROT0 (xxx: master name) bits in MSTACCCTLn register indicate security attribute and privilege attribute to be overwritten, respectively. It is selectable by xxx_SEL1 and xxx_SEL0 bits in MSTACCCTLn register whether security attribute and privileged attribute are overwritten or not, respectively. Access to MSTACCCTLn register is allowed by secure and privileged transaction only. MSTACCCTLn register setting is applied to both read and write transaction.

Table 13.7 shows security and privilege attribute and Table 13.8 lists bus masters supporting TZM, and corresponding initial setting of MSTACCCTLn register. Some Bus Masters have own configurable registers. If overwrite is disabled, attribute can be also changed by those registers. For details, see register descriptions of each section.

Table 13.7 Security and Privilege Attribute

AXI signal	AHB signal	Description	
AxPROT[1]	HNONSEC	Security attribute	0: Secure 1: Non-secure
AxPROT[0]	HPORT[1]	Privilege attribute	0: Unprivileged 1: Privileged

Table 13.8 Bus Master supporting TZM and Initial Setting of Master Access Control Register (1 of 2)

Table 13.8 Bus Master supporting TZM and Initial Setting of Master Access Control Register (2 of 2)

Bus Master	Port	Master Access Control Register						Bus Master Information			
			Bit		Initial Setting			Initial Setting		Configurable Register	
		Register Name	SEL	PROT	Overwrite	Security attribute	Privilege attribute	Security attribute	Privilege attribute	Security attribute	Privilege attribute
CoreSight	ETR	MSTACCCTL0	3:2	1:0	Enabled both	Non-secure	Non-privileged	Secure	Non-privileged	AXICTL	AXICTL
	AXI-AP	MSTACCCTL2	3:2	1:0	Enabled both	Non-secure	Non-privileged	Non-secure	Privileged	CSW	CSW

Note 1. Transaction from LLPP of Cortex-R52 is always non-secure. LLPP peripherals need to be used as non-security peripherals.

13.4.4.2 TrustZone Slave (TZS)

TrustZone Slave (TZS) provides the function to filter bus transaction by comparing its attribution with security level (SL) set in slave access control register (SLVACCCTLn). Combination of security level (SL) and transaction filtering rule are defined in Table 13.9. SL can be set in SLVACCCTLn register each slave and it is applied to both read and write transaction. Table 13.10 lists bus slave supporting TZS, and corresponding bit, initial setting and configurable range of SLVACCCTLn register. When transaction is not allowed by TZS, bus error reply is generated. TZS is used for peripheral register access basically.

Table 13.9 Transaction filtering rule for TrustZone Slave (TZS)

Security Level (SL)	Transaction			
	Non-secure		Secure	
	Unprivileged	Privileged	Unprivileged	Privileged
0	Allowed	Allowed	Allowed	Allowed
1	—	Allowed	Allowed	Allowed
2	—	—	Allowed	Allowed
3	—	—	—	Allowed

Note: When transaction is not allowed, bus error reply is generated.

Table 13.10 Bus Slave supporting TZS and Initial Setting and Configurable Range of Slave Access Control Register (1 of 4)

13.4.4.3 TZC-400

TrustZone Address Space Controller (TZC-400) provides the function to realize secure memory access. It performs security checks on transactions to memory basically. Transactions must meet security requirements to access memory or peripherals. This is an IP ("CoreLink™ TrustZone Address Space Controller TZC-400") provided by Arm. Table 13.11 shows combination of region ID access register setting and transaction filtering rule. Table 13.12 lists TZC-400 modules in this LSI. After reset is released, TZC-400 starts up with rejection of all the transaction. Set the control register of TZC-400 to proper access permission by secure transaction so that master can access the memory area with proper access attribute. Since Cortex-R52 AXIS interface has own privilege setting, access level must be match between Cortex-R52 AXIS and TZC-400-8.

For details on the functions of TZC-400, see the relevant Technical Reference Manual.

Table 13.11 Transaction filtering rule for TZC-400

Region ID access register nsaid_wr_en[31:16] nsaid_rd_en[15:0]	Transaction			
	Non-secure		Secure	
	Unprivileged	Privileged	Unprivileged	Privileged
0x000F	Access allowed	Access allowed	Access allowed	Access allowed
0x000B	—	Access allowed	Access allowed	Access allowed
0x0003	—	—	Access allowed	Access allowed
0x0002	—	—	—	Access allowed

Setting other than values shown in the above table to the region ID access register is prohibited.

13.4.5 Address Expander

This LSI supports 35-bit address to access 32 GB area. Bus masters except Cortex-A55, CoreSight, and PCIE can handle 32-bit address space only. Address expander enables these 32-bit addressing bus masters to access over 4 GB area.

Over 4 GB area are DDR (0x2_0000_0000 to 0x3_FFFF_FFFF), PCIE0 (0x4_0000_0000 to 0x5_FFFF_FFFF), and PCIE1 (0x6_0000_0000 to 0x7_FFFF_FFFF). Mirror areas of these areas are available within 32-bit address space. Any 256 MB area from PCIE0 area, any 256 MB area from PCIE1 area, and any two 512 MB area can be mirrored to PCIE0 mirror (0xA000_0000 to 0xAFFF_FFFF), PCIE1 mirror (0xB000_0000 to 0xBFFF_FFFF), and DDR mirror 0 and 1 (0xC000_0000 to 0xDFFF_FFFF and 0xE000_0000 to 0xFFFF_FFFF) respectively by ADXCTLn register each 32-bit bus master. All the bus masters can access DDR area but only Cortex-R52 CPU0, CPU1 and DMAC (unit 0 to 2) can access PCIE area. Address boundary of selected area is 256 MB.

Set [32:28] bit of start address of the area to be mirrored to target bits of the ADXCTLn register each 32-bit bus master. Figure 13.4 shows the mirroring image when DDRMIR0[4:0] bits in ADXCTLn register is set to 10111b.

Note that Cortex-A55, CoreSight and PCIE can access DDR, PCIE0 and PCIE1 via not only over 4 GB area but also mirror area in 32-bit address space whose reference address is fixed, not configurable by address expander.

Table 13.13 Correspondence between master module and Address Expander

Symbol	Master module	PCIE0 mirror (256 MB) (0xA000_0000 to 0xAFFF_FFFF)	PCIE1 mirror (256 MB) (0xB000_0000 to 0xBFFF_FFFF)	DDR mirror 0 (512 MB) (0xC000_0000 to 0xDFFF_FFFF)	DDR mirror 1 (512 MB) (0xE000_0000 to 0xFFFF_FFFF)

Note 2. Reference address is not configurable. Fixed to 0x6_0000_0000 to 0x6_0FFF_FFFF.
Note 3. Reference address is not configurable. Fixed to 0x2_0000_0000 to 0x2_3FFF_FFFF.

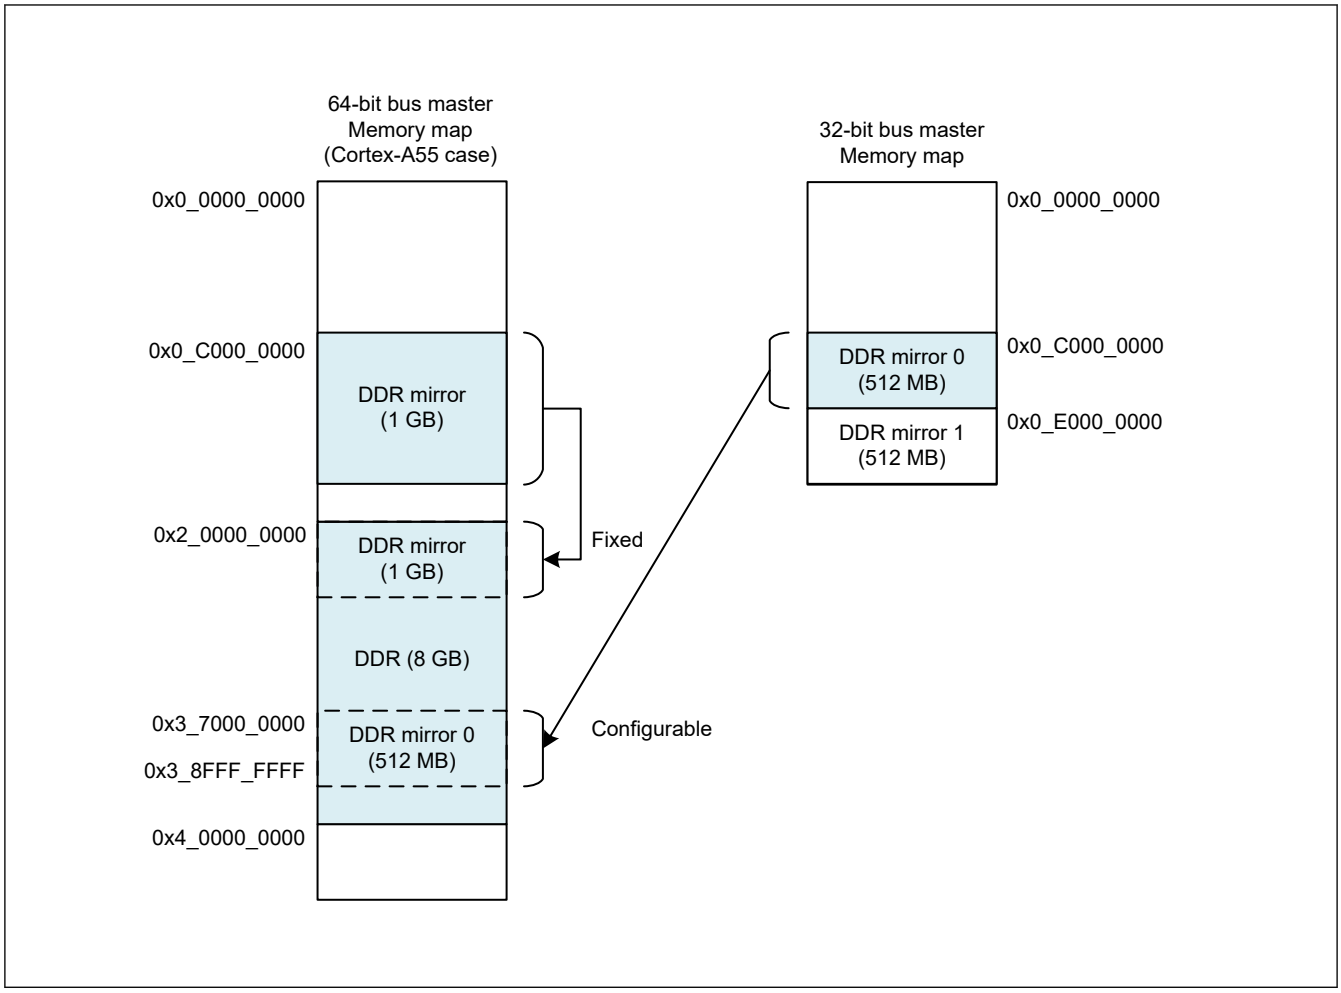

Figure 13.4 Mirroring image of the DDR area to 32-bit bus master

13.4.6 Interrupt

When a bus error, an MPU error, or TrustZone error occurs by reading or writing to the protected region, interrupt can be output. Table 13.14 lists the internal bus, master MPU, and TrustZone error interrupt sources. These interrupts are combined with peripheral error interrupts (PERI_ERR0 and PERI_ERR1) as error events with other error interrupts.

Table 13.14 Internal bus, master MPU, and TrustZone error interrupt sources (1 of 2)

Name	Interrupt sources
MPU_DMACR0	Master MPU10 Read channel for DMAC0 error
MPU_DMACW0	Master MPU10 Write channel for DMAC0 error
MPU_DMACR1	Master MPU11 Read channel for DMAC1 error
MPU_DMACW1	Master MPU11 Write channel for DMAC1 error
MPU_DMACR2	Master MPU12 Read channel for DMAC2 error
MPU_DMACW2	Master MPU12 Write channel for DMAC2 error
MPU_GMACR0	Master MPU13 Read channel for GMAC0 error
MPU_GMACW0	Master MPU13 Write channel for GMAC0 error
MPU_GMACR1	Master MPU0 Read channel for GMAC1 error
MPU_GMACW1	Master MPU0 Write channel for GMAC1 error
MPU_GMACR2	Master MPU1 Read channel for GMAC2 error
MPU_GMACW2	Master MPU1 Write channel for GMAC2 error
MPU_USBH	Master MPU2 for USB Host error

Table 13.14 Internal bus, master MPU, and TrustZone error interrupt sources (2 of 2)

Name	Interrupt sources
MPU_USBF	Master MPU3 for USB Function error
MPU_DBGR	Master MPU15 Read channel for AXI-AP error
MPU_DBGW	Master MPU15 Write channel for AXI-AP error
MPU_ETRR	Master MPU9 Read channel for ETR error
MPU_ETRW	Master MPU9 Write channel for ETR error
MPU_SHOSTIF	Master MPU14 for Serial Host I/F error
MPU_LCDCR	Master MPU6 Read channel for LCDC error
MPU_LCDCW	Master MPU6 Write channel for LCDC error
MPU_SDHIR0	Master MPU4 Read channel for SDHI0 error
MPU_SDHIW0	Master MPU4 Write channel for SDHI0 error
MPU_SDHIR1	Master MPU5 Read channel for SDHI1 error
MPU_SDHIW1	Master MPU5 Write channel for SDHI1 error
MPU_PCIER0	Master MPU7 Read channel for PCIE0 error
MPU_PCIEW0	Master MPU7 Write channel for PCIE0 error
MPU_PCIER1	Master MPU8 Read channel for PCIE1 error
MPU_PCIEW1	Master MPU8 Write channel for PCIE1 error
CA55MPUR	Cortex-A55 read error to Master MPU registers
CA55MPUW	Cortex-A55 write error to Master MPU registers
CR521MPUR	Cortex-R52 CPU1 read error to Master MPU registers
CR521MPUW	Cortex-R52 CPU1 write error to Master MPU registers
MAINBUSA_ERRINT	Internal main bus A error
MAINBUSR_ERRINT	Internal main bus R error
LLPPBUS_ERRINT	LLPP bus error
TZC_DDR_A0A1	TZC-400-0 for DDR A0 and A1 I/F error
TZC_DDR_A4	TZC-400-1 for DDR A4 I/F error
TZC_PCIE	TZC-400-2 for PCIE error
TZC_DDR_R2	TZC-400-3 for DDR R2 I/F error
TZC_DDR_R3	TZC-400-4 for DDR R3 I/F error
TZC_SYSRAM	TZC-400-5 for SYSRAM error
TZC_BSC	TZC-400-6 for BSC error
TZC_XSPI	TZC-400-7 for XSPI error
TZC_TCM	TZC-400-8 for TCM error
MAINBUSA_SEC_ERRINT	Internal main bus A error (TZM and TZS)
MAINBUSR_SEC_ERRINT	Internal main bus R error (TZM and TZS)
PERI_SEC_ERRINT	LLPP0, LLPP1, NONSAFETY, SAFETY Peripheral error (TZS)

Note: Setting of the Action register in TZC-400 is needed to generate TZC-400 error interrupt.

13.5 Usage Notes

13.5.1 Release of Register Write Protection

The Master MPU registers are write protected. To release write protection, follow the steps below.

1. Write 0x0000A508 to PRCRS register (release write protection using PRCS3 bit).

2. Write value to the STADDm, ENDADDm, ERRINF, and ERRINF_x registers.
3. Write 0x0000A500 to PRCRS register (set write protection with PRCS3 bit).

13.5.2 Initial Setting of Master MPU

The initial setting of region 0 specifies all the area of memory map with read/write protection for every master MPU. This means the master modules cannot access any of the bus slaves. The Master MPU register must be changed from Cortex-R52 CPU0 before operating master modules. By setting CPU_CTRL register by Cortex-R52 CPU0, Cortex-A55 and Cortex-R52 CPU1 can also change the Master MPU registers in case of Cortex-R52 CPU0 boot mode.

13.5.3 New MPU Error Detection While Preserving Valid Error Information

When master MPU detects new error access while preserving valid error information (VALID bit = 1 in Master MPU error information registers), the error information is not updated to the new one unless the VALID bit is cleared to 0 by writing 0. Nevertheless, access to the safety region is protected. Interrupt is also not regenerated while the VALID bit is 1.

13.5.4 TCM Access via AXIS Interface of Cortex-R52

Bus masters can access to TCMs of Cortex-R52 via AXIS interface in Cortex-R52. AXIS has some limitations for data size and address alignment. Table 13.15 shows the limitation of TCM access via AXIS interface each bus master and Table 13.16 shows register setting to access TCM under limitation.

Table 13.15 Limitation of TCM access via AXIS interface

Bus master	Description
Cortex-A55 via ACEM Cortex-R52 CPU0 via AXIM Cortex-R52 CPU1 via AXIM	Instruction fetch is not possible. Data access Read ● Possible if region attribution is set to Device and LD instruction (8, 16, or 32 bits) is used to access. Write ● Possible if region attribution is set to Device and ST instruction (8, 16, or 32 bits, or 64 bits with 64-bit address alignment) is used to access.
DMAC0	Descriptor access is not possible. Data access Read ● Possible if transfer size is 8, 16, 32, 64, 128, or 512 bits. Write ● Possible if transfer size is 8, 16, 32, 64, or 128 bits. ● Possible if transfer size is 512 bits and access address is 64-byte aligned. 256-bits transfer is not possible.
DMAC1, 2	Descriptor access is not possible. Data access Read and Write ● Possible if transfer size is 8, 16, 32, 64, or 128 bits. 256-bit transfer is not possible.
GMAC0, 1, 2	Read and Write ● Possible if transfer is 128-bit ×1 beat and access address is 4-byte aligned. Other combination transfer is not possible.
USBHC USBf	Descriptor access is not possible. Data access Read and Write ● Possible if transfer size is 128 bits and access addresses is 16-byte aligned. Other combination transfer is not possible.
PCIE0, 1	Read and Write ● Possible if burst length is 1.
CoreSight (AXI-AP)	No limitation in the supported access.
CoreSight (ETR)	Read ● Possible if access address is 4-byte or 16-byte aligned. Write ● Possible if burst length is 1.

Table 13.16 Register setting to access TCM from each bus master

Bus master	Register	Bit setting
DMAC0	CHCFG_n	DDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), 0x4 (128-bit), or 0x6 (512-bit) SDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), 0x4 (128-bit), or 0x6 (512-bit)
	CHEXT_n	DCA = 0x2 if CHCFG_n.DDS = 0x4 or 0x6 and destination is TCM SCA = 0x2 if CHCFG_n.SDS = 0x4 or 0x6 and source is TCM
DMAC1, 2	CHCFG_n	DDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), or 0x4 (128-bit) SDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), or 0x4 (128-bit)
	CHEXT_n	DCA = 0x2 if CHCFG_n.DDS = 0x4 and destination is TCM SCA = 0x2 if CHCFG_n.SDS = 0x4 and source is TCM

	CHEXT_n	DPR = 1xxxb SPR = 1xxxb
PCIE	PCI_RC_MSET1 PCI_EP_MSET1	AXIMMB = 0

13.5.5 Exclusive Access

Exclusive access instructions for synchronization and semaphores, and atomic instructions in Cortex-R52 and Cortex-A55 are not supported in the sharable areas. Use mailbox and semaphore (MBXSEM) for exclusive control.

For details of the target instructions, see the below sections in Arm Architecture Reference Manual for A-profile architecture (DDI 0487).

- For AArch64
  - B2.17 Synchronization and semaphores
  - C3.2.12 Atomic instructions
- For AArch32
  - E2.10 Synchronization and semaphores

14. Bus State Controller

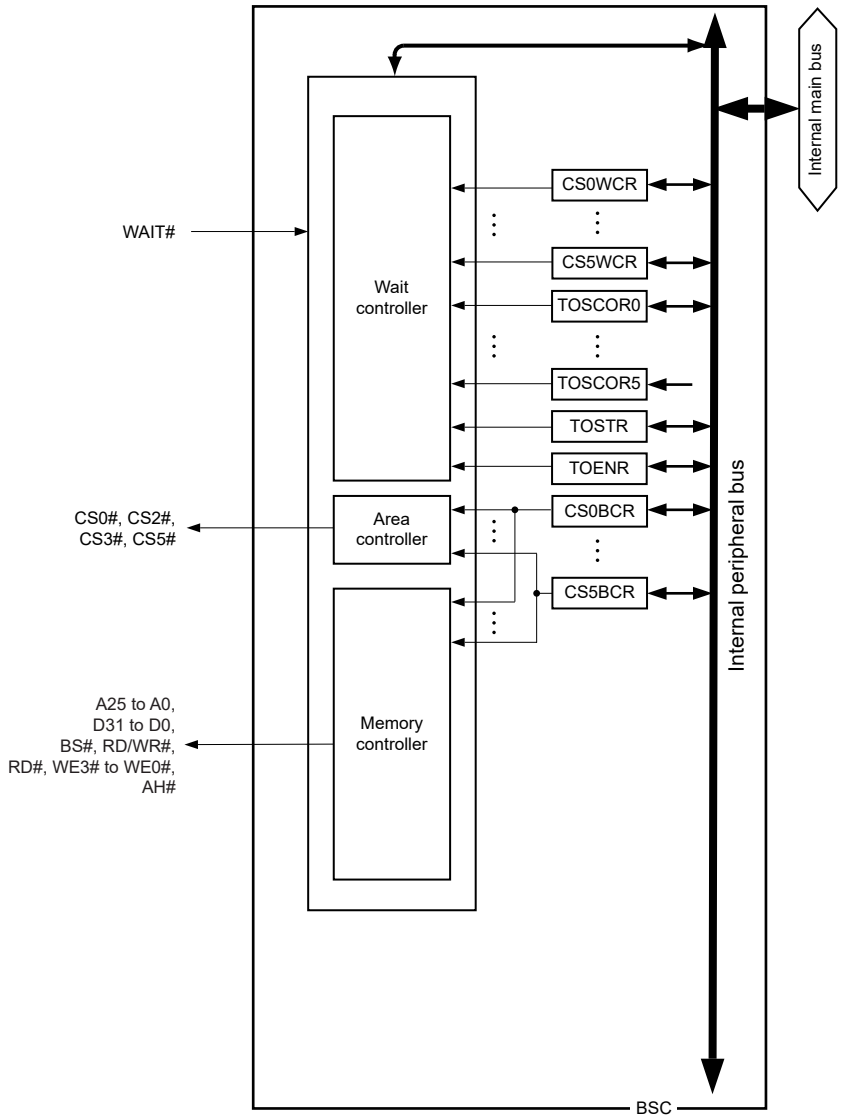
14.1 Overview

The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, other memory storage devices, and external devices.

Table 14.1 Bus state controller specifications

Item	Description
External address space	• A maximum of 64 MB for each of areas CS0, CS2, CS3, and CS5 • Can specify the following for each CS space: SRAM interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), and MPX-I/O. – Data bus width (8, 16, or 32 bits) Insertion of wait cycles for each read access and write access. • Can set independent idle cycles for the following five cases: Read-write (in same space/different spaces), read-read (in same space/different spaces), and the first cycle is a write access.
Various interfaces	• SRAM interface Supports the interface that can directly connect to the SRAM.
	• Burst ROM interface (clocked asynchronous) High-speed access to the ROM that has the page mode function.
	• MPX-I/O interface Can directly connect to a peripheral LSI that needs an address/data multiplexing.
	• SRAM interface with byte selection Can connect directly to an SRAM with byte selection.
	• Burst ROM interface (clocked synchronous) Can connect directly to a burst ROM of the clocked synchronous type.
External WAIT# pin	• Detection of long wait state for access by the signal on the external WAIT# pin • A timeout detection condition is specifiable per CS space • Once timeout is detected, the external WAIT function is disabled and an external wait timeout detection interrupt is issued

Figure 14.1 is a block diagram of the bus state controller.



Note: CSnWCR: CSn Space Wait Control Register (n = 0, 2, 3, 5)
CSnBCR: CSn Space Bus Control Register (n = 0, 2, 3, 5)
TOSCORn: Timeout Cycle Constant Register (n = 0, 2, 3, 5)
TOSTR: Timeout Status Register
TOENR: Timeout Enable Register

Figure 14.1 Block diagram of bus state controller

Table 14.2 lists the input/output pins of the bus state controller.

Table 14.2 Input/output pins of the bus state controller (1 of 2)

Name	I/O	Function
A25 to A0	Output	Address output pins
D31 to D0	I/O	Data input/output pins
BS#	Output	Status signal output pin that indicates the start of the bus cycle
CS0#, CS2#, CS3#, CS5#	Output	Chip select signal output pins
RD/WR#	Output	Strobe signal output pin that indicates a read or write access Connect this pin to WE# pins when SRAM with byte selection is connected.

Table 14.2 Input/output pins of the bus state controller (2 of 2)

Name	I/O	Function
RD#	Output	Strobe signal output pin that indicates a read signal (read data output enable signal)
WE3#/AH#	Output	Write strobe signal output pin for D31 to D24 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the address hold signal output pin when the MPX-I/O interface is used.
WE2#	Output	Write strobe signal output pin for D23 to D16 Connect this pin to the byte select pin when an SRAM with byte selection is connected.
WE1#	Output	Write strobe signal output pin for D15 to D8 Connect this pin to the byte select pin when SRAM with byte selection is connected.
WE0#	Output	Write strobe signal output pin for D7 to D0 Connect this pin to the byte select pin when SRAM with byte selection is connected.
WAIT#	Input	External wait control signal input pin used to insert a wait state into a bus cycle

14.2 Area Overview

14.2.1 Address Map

The kind of memory to be connected to the external address space and the data bus width are specified in each of CS0, CS2, CS3, and CS5 spaces. The address map for the external address space is listed below.

Table 14.3 Address map

Internal address	Space	Memory to be connected
0x7000_0000 to 0x73FF_FFFF	CS0	SRAM interface, SRAM with byte selection, burst ROM (asynchronous or synchronous)
0x7400_0000 to 0x77FF_FFFF	CS2	SRAM interface, SRAM with byte selection
0x7800_0000 to 0x7BFF_FFFF	CS3	SRAM interface, SRAM with byte selection
0x7C00_0000 to 0x7FFF_FFFF	CS5	SRAM interface, SRAM with byte selection, MPX-I/O

14.3 Register Map

Table 14.4 BSC register map

14.4 Register Descriptions

14.4.1 CSnBCR : CSn Space Bus Control Register (n = 0, 2, 3, 5)

Base address: BSC = 0x8021_0000

Offset address: 0x004 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	IWW[2:0]			IWRWD[2:0]			IWRWS[2:0]			IWRRD[2:0]			IWRRS[2:0]		
Value after reset:	0	0	1	1	0	1	1	0	1	1	0	1	1	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	TYPE[2:0]			—	BSZ[1:0]		—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	—	These bits are read as 0. The write value should be 0.	R/W
10:9	BSZ[1:0]	Data Bus Width Specification Specify the data bus width of CS spaces. For MPX-I/O, selects bus width by address. ● If area 5 is specified as MPX-I/O, setting these bits to 11b selects 8-bit or 16-bit bus width according to the address settings of the SZSEL bit in CS5WCR. Setting these bits to 01b or 10b selects the fixed bus width of 8-bit or 16-bit, respectively. ● If area 0 is specified as clocked synchronous burst ROM space, the bus width can be specified as either 16 bits or 32 bits. 0 0: Setting prohibited 0 1: 8-bit size 1 0: 16-bit size 1 1: 32-bit size	R/W
11	—	This bit is read as 1. The write value should be 1.	R/W
14:12	TYPE[2:0]	Memory Connected to a Space Specify the type of memory connected to a CS space. For details for memory type in each area, see Table 14.3. 0 0 0: Normal space 0 0 1: Burst ROM (clock asynchronous) 0 1 0: MPX-I/O 0 1 1: SRAM with byte selection 1 0 0: Setting prohibited 1 0 1: Setting prohibited 1 1 0: Setting prohibited 1 1 1: Burst ROM (clock synchronous)	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W
18:16	IWRRS[2:0]	Idle State Insertion between Read-Read Cycles in the Same CS Space Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles are for the same CS space. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W

Bit	Symbol	Function	R/W
21:19	IWRRD[2:0]	Idle State Insertion between Read-Read Cycles in Different CS Spaces Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles switch between different CS spaces. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
24:22	IWRWS[2:0]	Idle State Insertion between Read-Write Cycles in the Same CS Space Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-write cycle of which continuous access cycles are for the same CS space. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
27:25	IWRWD[2:0]	Idle State Insertion between Read-Write Cycles in Different CS Spaces Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycle is a read-write one in which continuous access cycles switch between different CS spaces. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
30:28	IWW[2:0]	Idle Cycles between Write-Read Cycles and Write-Write Cycles These bits specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycles are the write-read cycle and write-write cycle. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The CSnBCR register specifies the memory connected to each CS space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting that are required for accessing the external memory are completed.

Idle cycles may be inserted even when they are not specified. For details, see section 14.5.9. Wait between Access Cycles.

14.4.2 CSn Space Wait Control Register (CSnWCR) (n = 0, 2, 3, 5)

The CSnWCR register specifies various wait cycles for external memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

14.4.2.1 CS0WCR_0 : CS0 Space Wait Control Register for Normal Space, SRAM with Byte Selection

Base address: BSC = 0x8021_0000

Offset address: 0x028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	BAS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SW[1:0]		WR[3:0]				WM	—	—	—	—	HW[1:0]	
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	HW[1:0]	Delay States from RD#, WEn# Negation to Address, CS0# Negation Specify the number of delay states from RD# and WEn# inactive to address and CS0# inactive. 0 0: 0.5 cycles 0 1: 1.5 cycles 1 0: 2.5 cycles 1 1: 3.5 cycles	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	WR[3:0]	Number of Access Waits Specify the number of wait insertions that are necessary for read/write access. 0x0: No wait insertion 0x1: 1 cycle 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 8 cycles 0x8: 10 cycles 0x9: 12 cycles 0xA: 14 cycles 0xB: 18 cycles 0xC: 24 cycles Others: Setting prohibited	R/W
12:11	SW[1:0]	Number of Delay Cycles from Address, CSn# Assertion to RD#, WEn# Assertion Specify the number of delay cycle states from address and CS0# active to RD# and WEn# active. 0 0: 0.5 cycles 0 1: 1.5 cycles 1 0: 2.5 cycles 1 1: 3.5 cycles	R/W
19:13	—	These bits are read as 0. The write value should be 0.	R/W
20	BAS*1	SRAM with Byte Selection Byte Access Select Specifies the WE# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W

Bit	Symbol	Function	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When BAS = 0, the write access timing of the SRAM interface with byte selection is the same as that of the SRAM interface. In write operation, data is written to the memory when the byte select pins (WEn# (n = 0 to 3)) are active. In read operation, the active timing of the WEn# (n = 0 to 3) pins are different from that of the SRAM interface and the byte selection signal is output from the WEn# (n = 0 to 3) pins. When BAS = 1, the active timing of the WEn# (n = 0 to 3) and RD/WR# pins varies. In write operation, data is written to the memory when the write enable pin (RD/WR#) is active. Set HW[1:0] for the write data hold time to the RD/WR# inactive timing to ensure the hold time. For details of access timing, see section 14.5.7. SRAM Interface with Byte Selection.

14.4.2.2 CSnWCR_0 : CSn Space Wait Control Register for Normal Space, SRAM with Byte Selection (n = 2, 3)

Base address: BSC = 0x8021_0000

Offset address: 0x030 + 0x4 × (n - 2)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	BAS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	WR[3:0]				WM	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access waits is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	WR[3:0]	Number of Access Waits Specify the number of waits that are necessary for read/write access. 0x0: No wait insertion 0x1: 1 cycle 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 8 cycles 0x8: 10 cycles 0x9: 12 cycles 0xA: 14 cycles 0xB: 18 cycles 0xC: 24 cycles Others: Setting prohibited	R/W
19:11	—	These bits are read as 0. The write value should be 0.	R/W
20	BAS	SRAM with Byte Selection Byte Access Select Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

14.4.2.3 CS5WCR : CS5 Space Wait Control Register for Normal Space, SRAM with Byte Selection, and MPX-I/O

Base address: BSC = 0x8021_0000

Offset address: 0x03C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	SZSEL	MPXW SBAS	—	WW[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SW[1:0]		WR[3:0]				WM	—	—	—	—	HW[1:0]	
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	HW[1:0]	Delay Cycles from RD#, WEn# to Address, CS5# Specify the number of delay states from RD# and WEn# inactive to address and CS5# inactive when area 5 is specified as the SRAM interface or the SRAM interface with byte selection. When area 5 is specified as the MPX-I/O interface, these bits specify the number of delay states from RD# and WEn# inactive to CS5# inactive. 0 0: 0.5 states 0 1: 1.5 states 1 0: 2.5 states 1 1: 3.5 states	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access wait is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	WR[3:0]	Number of Read Access Waits Specify the number of waits that are necessary for read access. 0x0: No wait insertion 0x1: 1 wait 0x2: 2 waits 0x3: 3 waits 0x4: 4 waits 0x5: 5 waits 0x6: 6 waits 0x7: 8 waits 0x8: 10 waits 0x9: 12 waits 0xA: 14 waits 0xB: 18 waits 0xC: 24 waits Others: Setting prohibited	R/W
12:11	SW[1:0]	Number of Delay Cycles from Address, CS5# Assertion to RD#, WEn# Assertion Specify the number of delay states from address and CS5# active to RD# and WEn# active when area 5 is specified as the SRAM interface or the SRAM interface with byte selection. When area 5 is specified as the MPX-I/O interface, these bits specify the number of delay states from the end of the address cycle (Ta3) to RD# and WEn# active. 0 0: 0.5 states 0 1: 1.5 states 1 0: 2.5 states 1 1: 3.5 states	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
18:16	WW[2:0]	Number of Write Access Waits Specify the number of wait insertions that are necessary for write access. 0 0 0: The same as WR[3:0] setting (number of read access waits) 0 0 1: No wait insertion 0 1 0: 1 wait 0 1 1: 2 waits 1 0 0: 3 waits 1 0 1: 4 waits 1 1 0: 5 waits 1 1 1: 6 waits	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W
20	MPXWSBAS	MPX-I/O Interface Address Cycle Wait and SRAM with Byte Selection Byte Access Select CS5BCR.TYPE[2:0] = 010b specifies the address cycle wait for MPX-I/O interface. This bit (MPXW) setting is valid only when area 5 is specified as MPX-I/O. CS5BCR.TYPE[2:0] = 011b specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. This bit (BAS) setting is valid only when area 5 is specified as SRAM with byte selection. 0: CS5BCR.TYPE[2:0] = 010b: Inserts no wait cycle CS5BCR.TYPE[2:0] = 011b: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: CS5BCR.TYPE[2:0] = 010b: Inserts 1 wait cycle CS5BCR.TYPE[2:0] = 011b: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W
21	SZSEL	MPX-I/O Interface Bus Width Specification Specifies an address to select the bus width when the BSZ[1:0] of the CS5BCR register are specified as 11b. This bit is valid only when area 5 is specified as MPX-I/O. The relationship between the SZSEL bit and bus width selected by A14 or A21 are summarized in the following table.	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

SZSEL	A14	A21	Bus Width
0	0	Not affected	8 bits
	1	Not affected	16 bits
1	Not affected	0	8 bits
	Not affected	1	16 bits

14.4.2.4 CS0WCR_1 : CS0 Space Wait Control Register for Burst ROM with Clocked Asynchronous

Base address: BSC = 0x8021_0000

Offset address: 0x028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	BST[1:0]		—	—	BW[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	W[3:0]				WM	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access waits is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	W[3:0]	Number of Access Waits Specify the number of waits to be inserted in the first access cycle. 0x0: No wait insertion 0x1: 1 wait 0x2: 2 waits 0x3: 3 waits 0x4: 4 waits 0x5: 5 waits 0x6: 6 waits 0x7: 8 waits 0x8: 10 waits 0x9: 12 waits 0xA: 14 waits 0xB: 18 waits 0xC: 24 waits Others: Setting prohibited	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
17:16	BW[1:0]	Number of Waits during Burst Access Specify the number of waits to be inserted between the second or subsequent access cycles in burst access. 0 0: No wait insertion 0 1: 1 wait 1 0: 2 waits 1 1: 3 waits	R/W
19:18	—	These bits are read as 0. The write value should be 0.	R/W
21:20	BST[1:0]	Burst Count Specification Specify the burst count for 16-byte or more access. Do not set BST[1:0] to 11b. For details, see Table 14.9.	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

Bus width	BST[1:0]	Burst count (16-byte access)
8 bits	00b	16 burst × 1 time
	01b	4 burst × 4 times
16 bits	00b	8 burst × 1 time
	01b	2 burst × 4 times
	10b	4-4 or 2-4-2 burst
32 bits	xx	4 burst × 1 time

14.4.2.5 CS0WCR_2 : CS0 Space Wait Control Register for Burst ROM with Clocked Synchronous

Base address: BSC = 0x8021_0000

Offset address: 0x028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BW[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit field:	—	—	—	—	—	W[3:0]				WM	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access waits is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	W[3:0]	Number of Access Waits Specify the number of waits to be inserted in the first access cycle. 0x0: No wait insertion 0x1: 1 wait 0x2: 2 waits 0x3: 3 waits 0x4: 4 waits 0x5: 5 waits 0x6: 6 waits 0x7: 8 waits 0x8: 10 waits 0x9: 12 waits 0xA: 14 waits 0xB: 18 waits 0xC: 24 waits Others: Setting prohibited	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
17:16	BW[1:0]	Number of Burst Wait Cycles Specify the number of waits to be inserted between the second or subsequent access cycles in burst access. 0 0: No wait insertion 0 1: 1 wait 1 0: 2 waits 1 1: 3 waits	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

14.4.3 TOSCORn : Timeout Cycle Constant Register n (n = 0, 2, 3, 5)

Base address: BSC = 0x8021_0000

Offset address: 0x060 + 0x4 × n

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TOCNUM[15:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TOCNUM[15:0]	Timeout Cycle Number When the number of external wait cycles matches the setting value of these bits, the external wait timeout detection interrupt occurs and the wait state is forcibly interrupted to end the cycle of access. 0x0000 65536 (number of external wait cycles) : 0x0001 1 : ⋮ 0xFFFF 65535 :	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The TOSCORn register sets the timeout to forcibly interrupt the wait state and end the access cycle of the CSn space. This register is enabled when the WM bit of the CSn Space Wait Control Register (CSnWCR) is 0 and the corresponding bit of the Timeout Enable Register (TOENR) is 1. When the number of wait cycles due to the signal on the external wait input pin matches the setting of TOSCORn, the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access, the Timeout Status flag for the corresponding space in the Timeout Status Register (TOSTR) is set, and an external wait timeout detection interrupt request from the external WAIT# pin is generated. The external wait timeout detection interrupt request is retained until the corresponding bit in the TOENR register is set to 0, or 0 is written to the Timeout Status flag for the corresponding space. Note that timeout detection is enabled even while the Timeout Status flag for the corresponding space in the TOSTR register is 1, and the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access in response to a further timeout.

14.4.4 TOSTR : Timeout Status Register

Base address: BSC = 0x8021_0000

Offset address: 0x080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CS5TOSTF	—	CS3TOSTF	CS2TOSTF	—	CS0TOSTF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS0TOSTF	CS0 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the CS0 space timeout cycle constant register (TOSCOR0). This bit is set or cleared in the following conditions. 0: Clearing condition When 0 is written in CS0TOSTF. 1: Setting condition When the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the CS0TOEN bit in the timeout enable register (TOENR) is 1, the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the TOSCOR0 register.	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	CS2TOSTF	CS2 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS2 space has matched the setting of the CS2 space timeout cycle constant register (TOSCOR2). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W

Bit	Symbol	Function	R/W
3	CS3TOSTF	CS3 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS3 space has matched the setting of the CS3 space timeout cycle constant register (TOSCOR3). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	CS5TOSTF	CS5 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS5 space has matched the setting of the CS5 space timeout cycle constant register (TOSCOR5). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The TOSTR register is used for status of the external wait input. When the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of waits in response to the signal on the external wait input matches the setting of TOSCORn, the timeout status flag for the corresponding space is set and an external wait timeout detection interrupt request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

14.4.5 TOENR : Timeout Enable Register

Base address: BSC = 0x8021_0000

Offset address: 0x084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CS5TOEN	—	CS3TOEN	CS2TOEN	—	CS0TOEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS0TOEN	CS0 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS0 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	CS2TOEN	CS2 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS2 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
3	CS3TOEN	CS3 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS3 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	CS5TOEN	CS5 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS5 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The TOENR register is used to enable or disable timeout detection function for each space.

14.5 Operation

14.5.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address. Data bus width can be selected from 8 bits, 16 bits, and 32 bits for the normal memory and SRAM with byte selection. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.

Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.

Table 14.6 to Table 14.8 show the relationship between device data width and access unit.

Table 14.6 32-bit external device access and data alignment in little endian

Operation	Data bus				Strobe signals			
	D31 to D24	D23 to D16	D15 to D8	D7 to D0	WE3#	WE2#	WE1#	WE0#

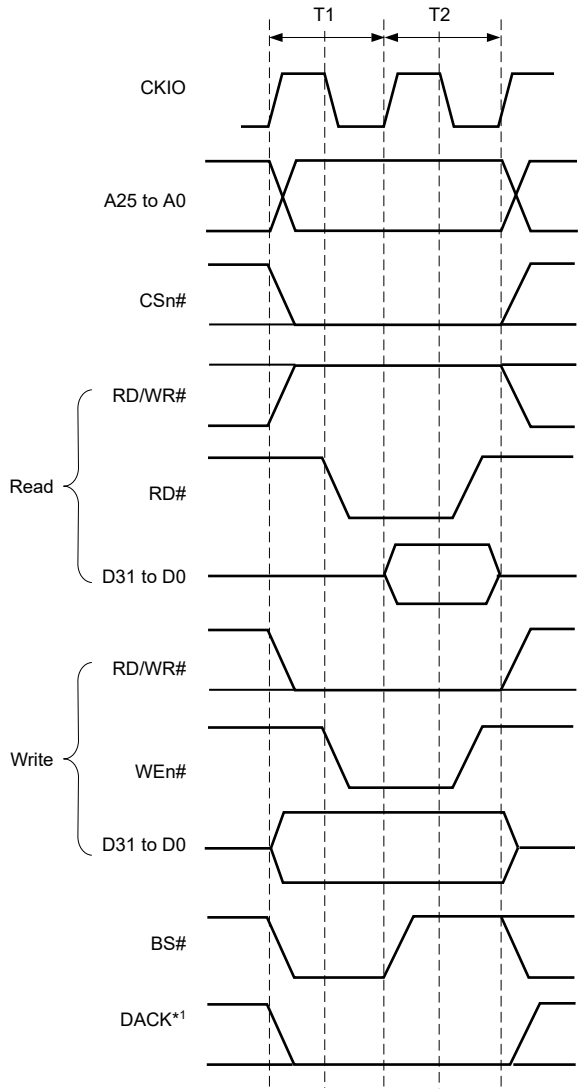
14.5.2 SRAM Interface

(1) Basic Timing

For access to an SRAM interface, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 14.5.7. SRAM Interface with Byte Selection. Figure 14.2 shows the basic timings of SRAM interface access. A no-wait normal access is completed in two cycles. The BS# signal is activated for one state to indicate the start of a bus cycle.



Note 1. The waveform for DACKn is when active-low is specified.

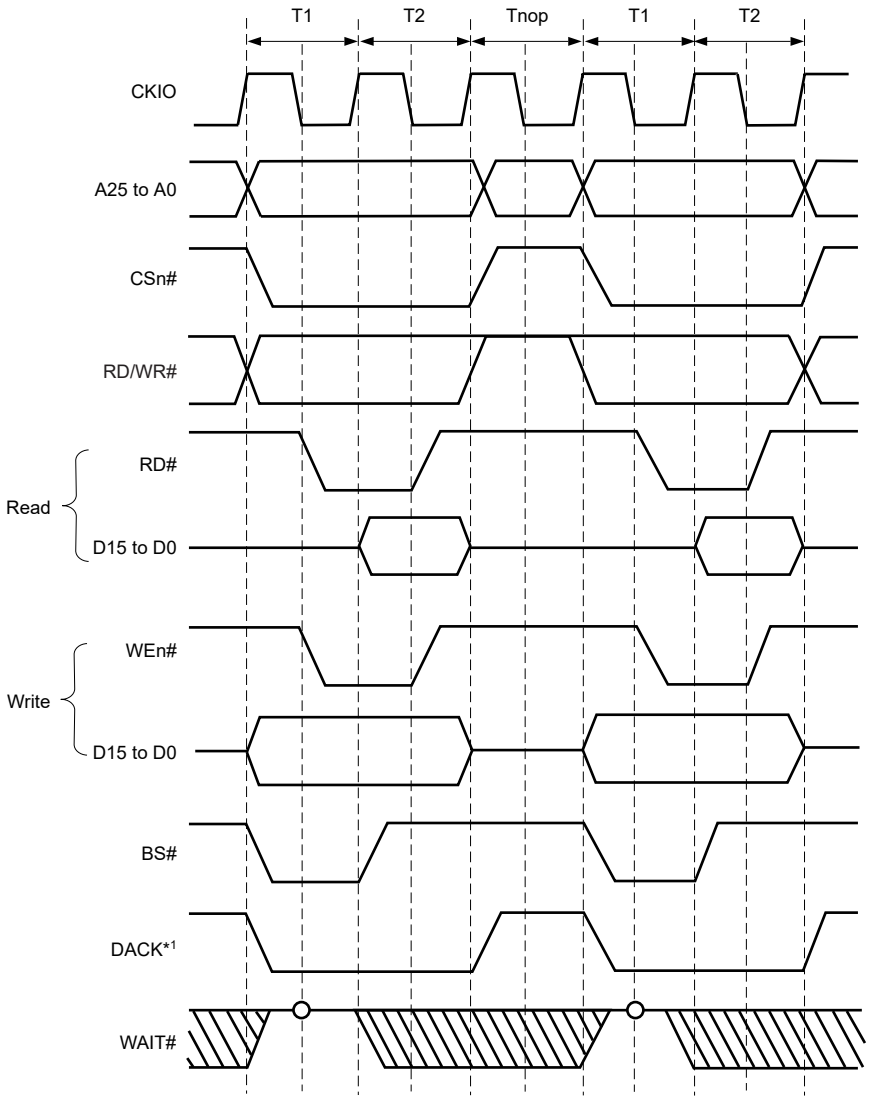
Figure 14.2 SRAM interface basic access timing (access wait 0)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 32 bits are always read in case of a 32-bit device. 16 bits are always read in case of a 16-bit device. When writing, only the WEn# signal for the byte to be written is activated.

It is necessary to output the data that has been read using RD# when a buffer is established in the data bus. The RD/WR# signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.

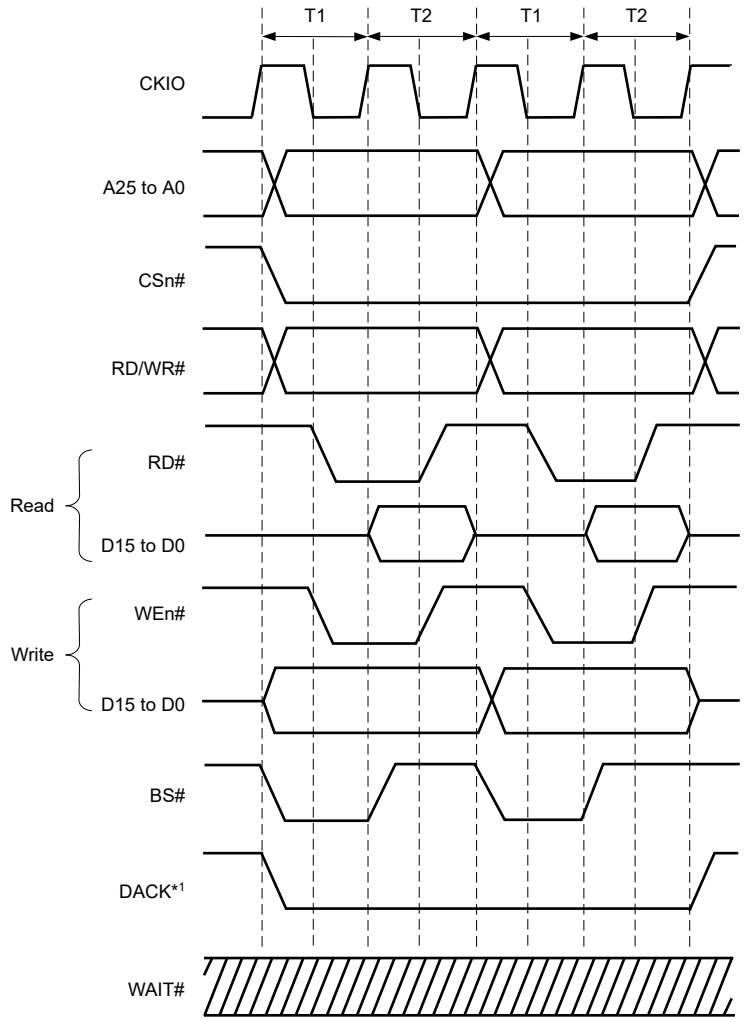
Figure 14.3 and Figure 14.4 show the basic timings in continuous access to the SRAM interface. If the WM bit in CSnWCR is cleared to 0, a Tnop cycle is inserted after the CSn space access to sample the external wait (Figure 14.3).

If the WM bit in CSnWCR is set to 1, external waits are ignored and no Tnop cycle is inserted (Figure 14.4).



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.3 Continuous access to the SRAM interface (1) (bus width = 16 bits, 32-bit access, CSnWCR.WM bit = 0 (access wait = 0, cycle wait = 0))



Note 1. The waveform for DACKn is when active-low is specified.

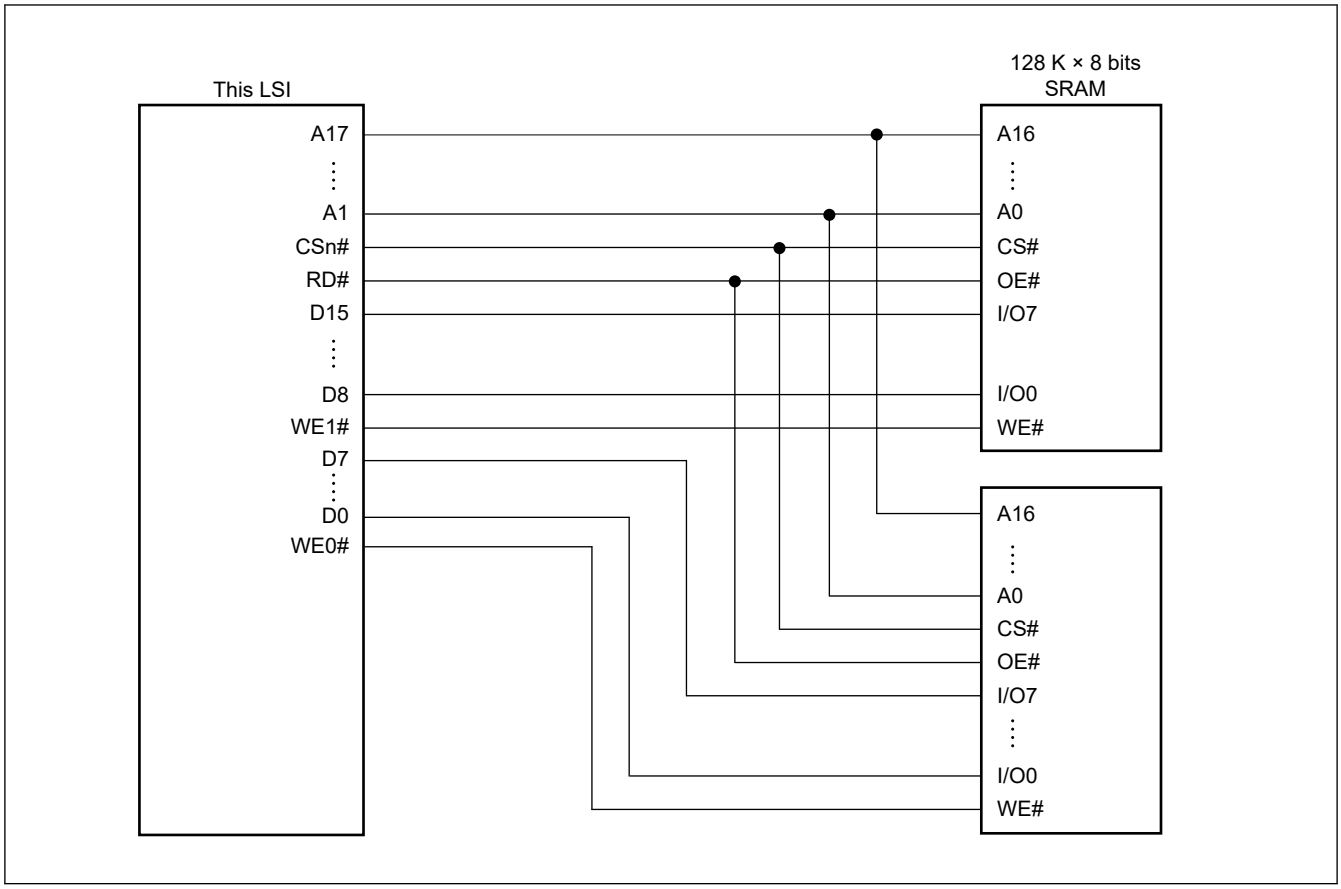

Figure 14.6 Example of 16-bit data-width SRAM connection

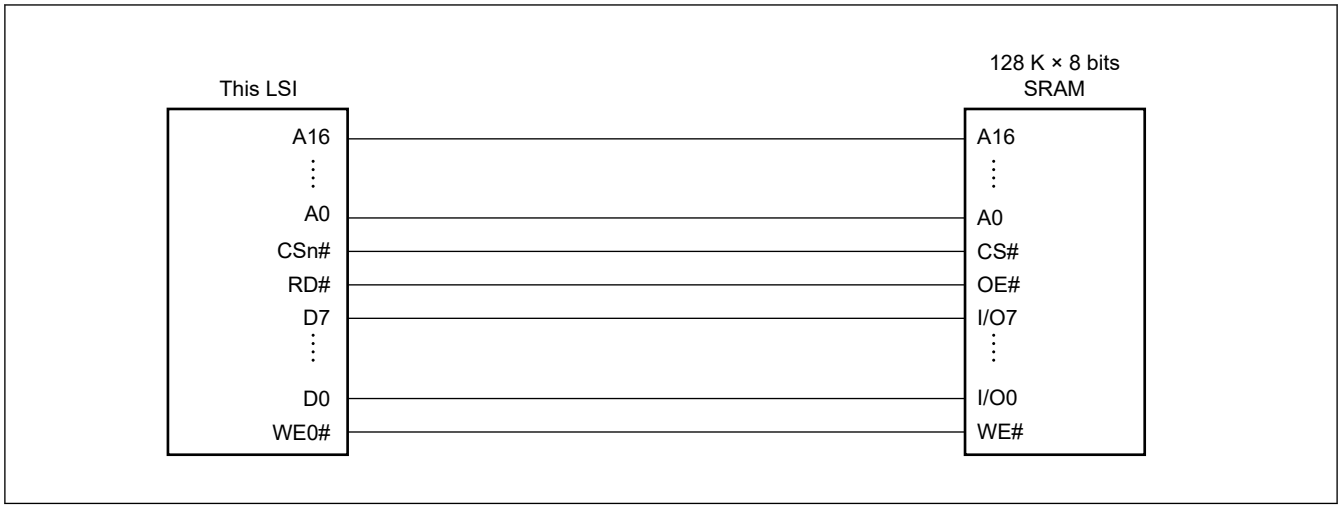

Figure 14.7 Example of 8-bit data-width SRAM connection

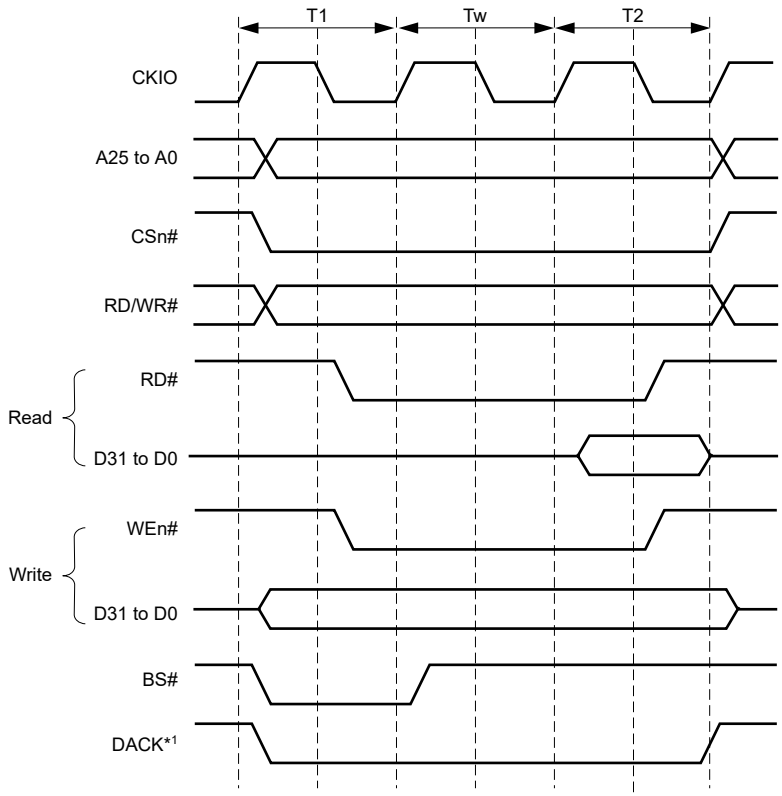
14.5.3 Access Wait Control

Wait insertion on an SRAM interface access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for area 5 to insert waits independently in read access and in write access. Areas 0, 2, and 3 have common access wait for read cycle and write cycle. The specified number of Tw states are inserted as waits in an SRAM interface access shown in Figure 14.8.

Example: Insertion of 1 cycle of waiting by a software wait
(WR[3:0] = 0001b, WW[2:0] = 000b)

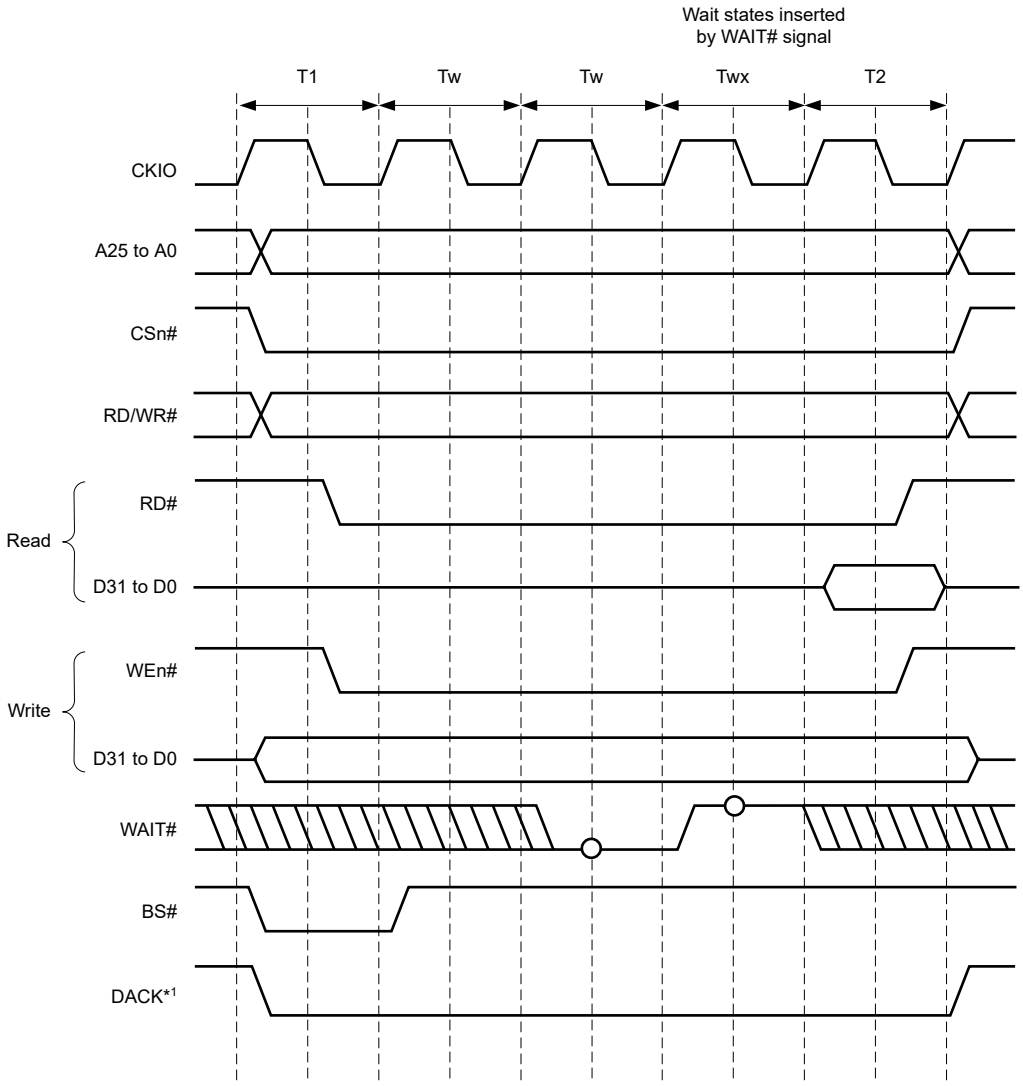


Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.8 Wait timing for SRAM interface access (software wait only)

When the WM bit in the CSnWCR register is cleared to 0, the signal on the external WAIT# pin is also sampled. WAIT# pin sampling is shown in Figure 14.9. Two waits are specified as software waits. The WAIT# signal is sampled on the falling edge of the CKIO signal at the transition from the T1 or Tw cycle to the T2 cycle.

Example: Insertion of 2 cycles of waiting by a software wait and 1 cycle of waiting by the WAIT# signal (WR[3:0] = 0010b, WW[2:0] = 000b, WM = 0)



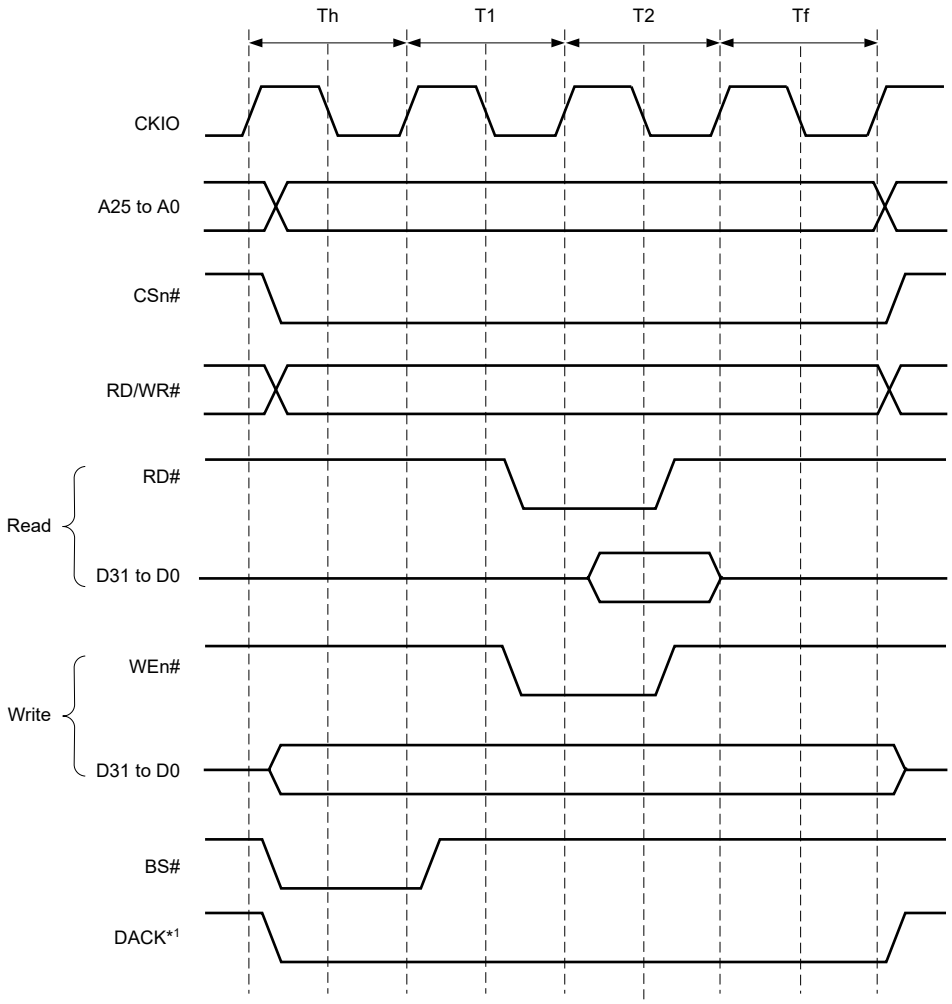
Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.9 Wait cycle timing for SRAM interface access (wait cycle insertion using WAIT# signal)

14.5.4 CSn# Assert Period Expansion

The number of states from CSn# active to RD#, WEn# active can be specified by setting bits SW1 and SW0 in CSnWCR. The number of states from the inactive state of the RD# and WEn# signals to the inactive state of the CSn# signal can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 14.10 shows an example. A Th state and a Tf state are added before and after an ordinary cycle, respectively. In these states, the RD# and WEn# signals are not activated, while other signals are activated. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.

Example: SW[1:0] = 01b (delay of 1.5 cycles) and HW[1:0] = 01b (delay of 1.5 cycles)



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.10 Active period expansion for the CSn signal

14.5.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, CS5#, AH#, RD#, and WEn# signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to an SRAM interface. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits.

Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.

Output of the addresses D15 to D0 or D7 to D0 is performed from state Ta2 to state Ta3. Because state Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in the CS5WCR register to 1.

The RD/WR# signal is output at the same time as the CS5# signal; it is high in the read cycle and low in the write cycle.

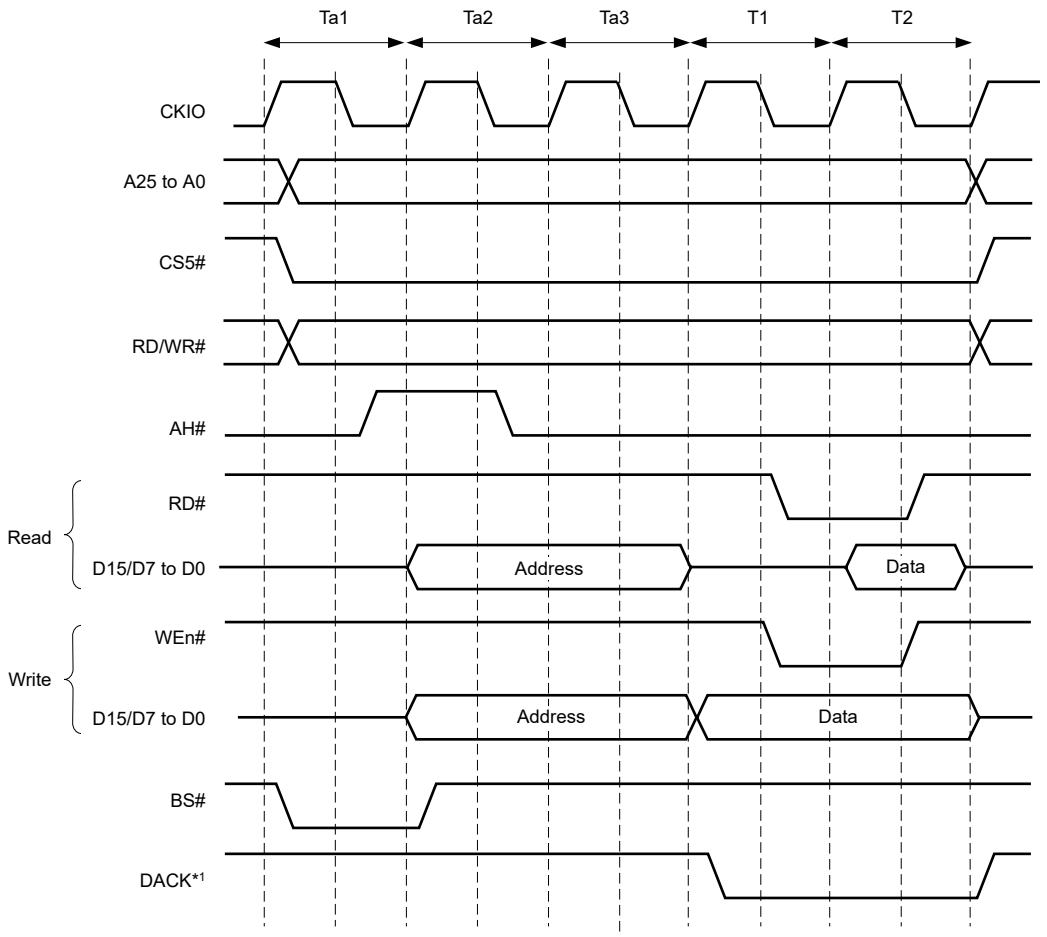
The data cycle is the same as that in an SRAM interface access.

Delay cycles specified in the SW[1:0] bits of the CS5WCR register are inserted between the Ta3 state and the T1 state.

Delay cycles specified in the HW[1:0] bits are added after the T2 state.

Timing charts are shown in Figure 14.11 to Figure 14.14.

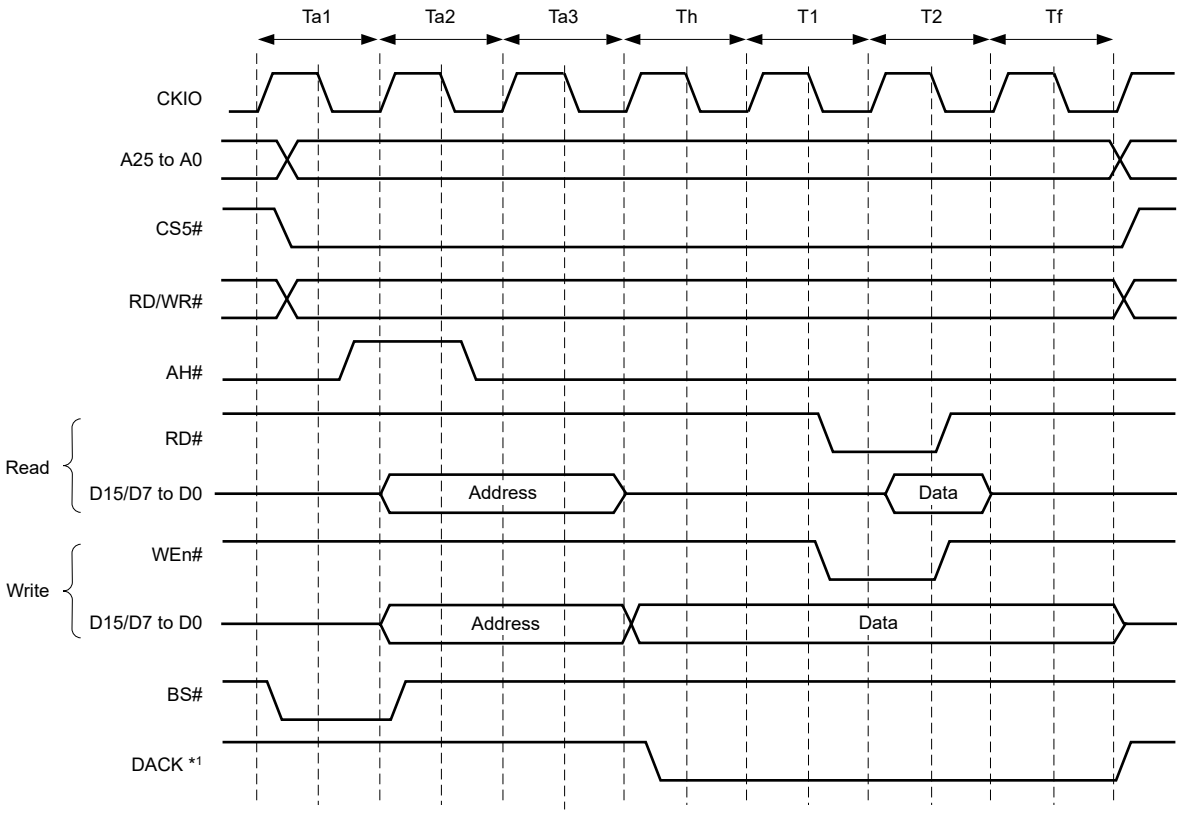
Example: MPXW = 0 (no insertion of wait cycles)



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.11 Access timing for MPX space (1) (address cycle no wait, data cycle no wait)

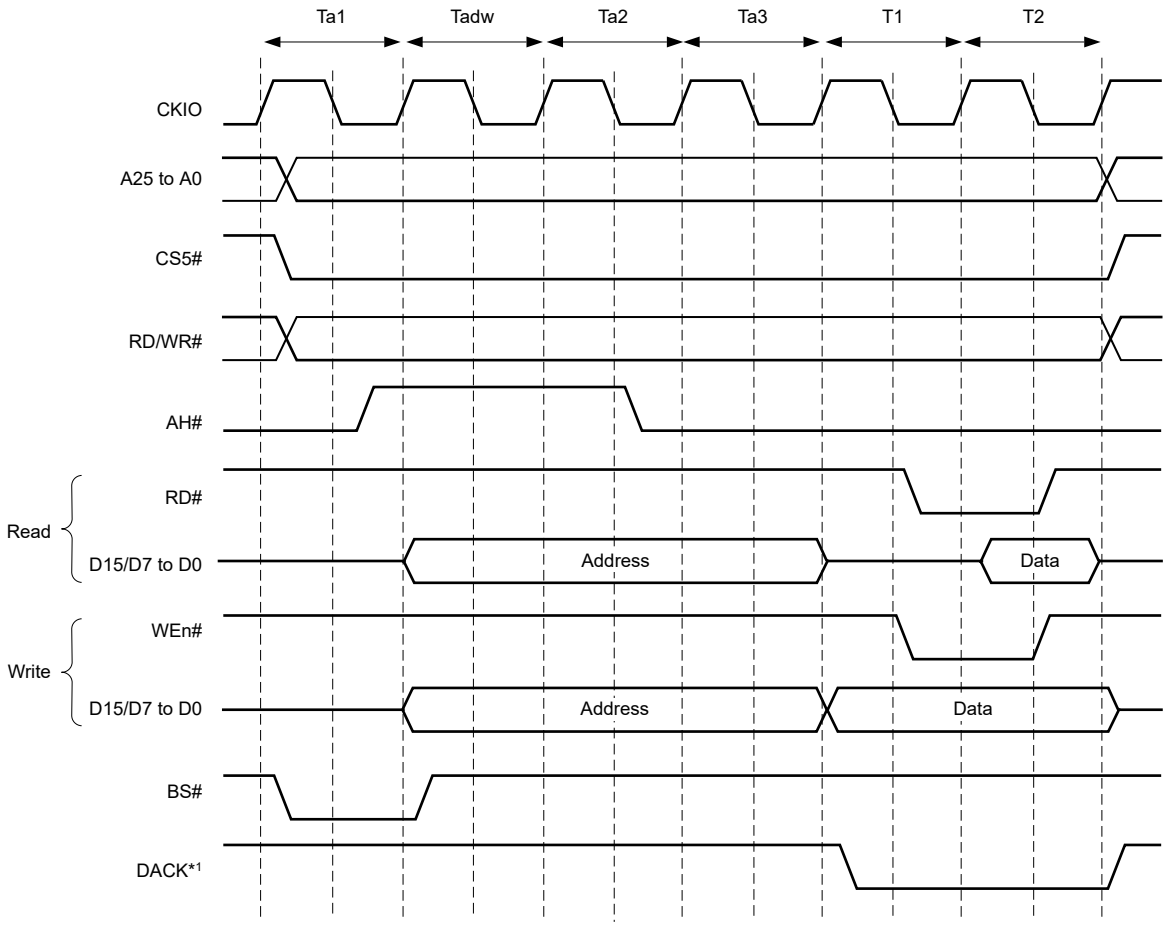
Example: MPXW = 0 (no insertion of wait cycles), SW[1:0] = 01b (delay of 1.5 cycles), HW[1:0] = 01b (delay of 1.5 cycles)



Note 1. The waveform for DACKn is when active-low is specified.

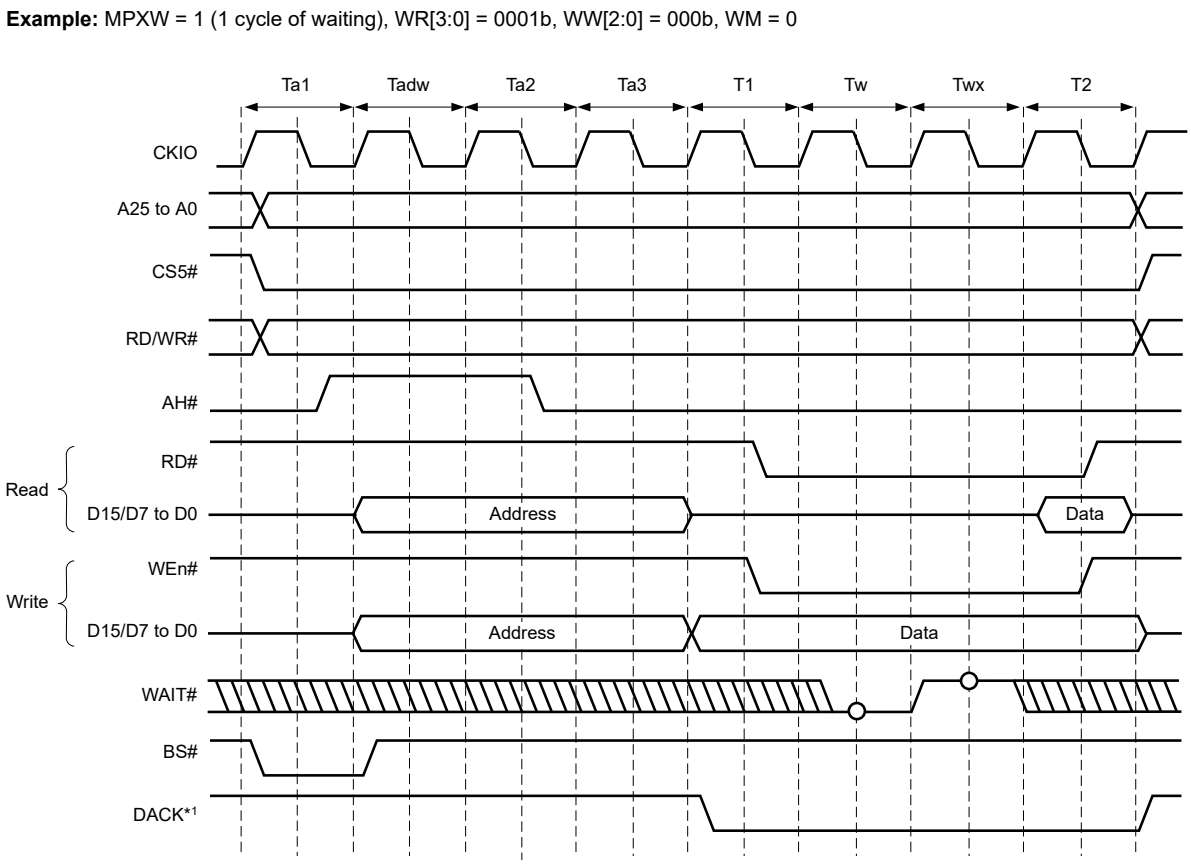
Figure 14.12 Access timing for MPX space (2) (address cycle no wait, 1.5 aassertion delay states, data cycle no wait, 1.5 delay states)

Example: MPXW = 1 (1 cycle of waiting)



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.13 Access timing for MPX space (3) (address cycle wait 1, data cycle no wait)



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.14 Access timing for MPX space (4) (address cycle access wait 1, data cycle wait 1, external wait 1)

14.5.6 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically, the same access as the SRAM interface is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without inactivating the RD# signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO signal.

For the 1st access cycle, the number of waits specified by the W3 to W0 bits in the CS0WCR_1 register is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in the CS0WCR_1 register is inserted.

In the access to the burst ROM (clocked asynchronous), the BS# signal is activated only to the first access cycle. An external wait input is valid only to the first access cycle.

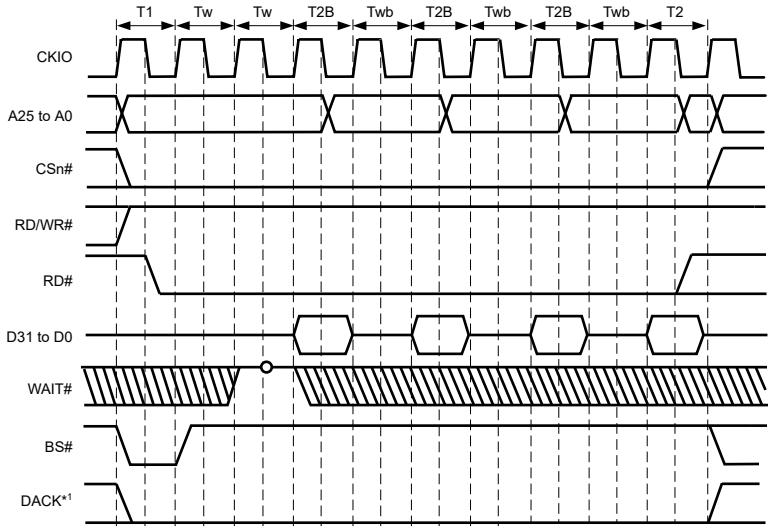
In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is the same as an SRAM interface.

Table 14.9 lists a relationship between bus width, access size, and the number of bursts. Figure 14.15 shows a timing chart.

Table 14.9 Relationship between bus width, access size, and number of bursts

Bus width	Access size	CSnWCR.BST[1:0] bits	Number of bursts	Access count
8 bits	8 bits	Not affected	1	1
	16 bits	Not affected	2	1
	32 bits	Not affected	4	1
	16 bytes	00	16	1
		01	4	4
	32 bytes	00	16	2
		01	4	8
	64 bytes	00	16	4
		01	4	16
16 bits	8 bits	Not affected	1	1
	16 bits	Not affected	1	1
	32 bits	Not affected	2	1
	16 bytes	00	8	1
		01	2	4
		10*1	4	2
			2, 4, 2	3
	32 bytes	00	8	2
		01	2	8
		10*1	4	4
			2, 4, 2	6
	64 bytes	00	8	4
		01	2	16
		10*1	4	8
			2, 4, 2	12
32 bits	8 bits	Not affected	1	1
	16 bits	Not affected	1	1
	32 bits	Not affected	1	1
	16 bytes	Not affected	4	1
	32 bytes	Not affected	4	2
	64 bytes	Not affected	4	4

Note 1. When the bus width is 16 bits, the access size is 16 bits or more, and the BST[1:0] bits in CS0WCR_1 are 10b, the number of bursts and access count depends on the access start address. At address 0x***0 or 0x***8, 4-4 burst access is performed (burst numbers: 4, 4 for a total of 2 rounds of access). At address 0x***4 or 0x***C, 2-4-2 burst access is performed (burst numbers: 2, 4, 2 for a total of 3 rounds of access).



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.15 Burst ROM access timing (clocked asynchronous) (bus width = 32 bits, 16-byte transfer (number of burst 4), wait cycles inserted in first access = 2, wait cycles inserted in second and subsequent access cycles = 1)

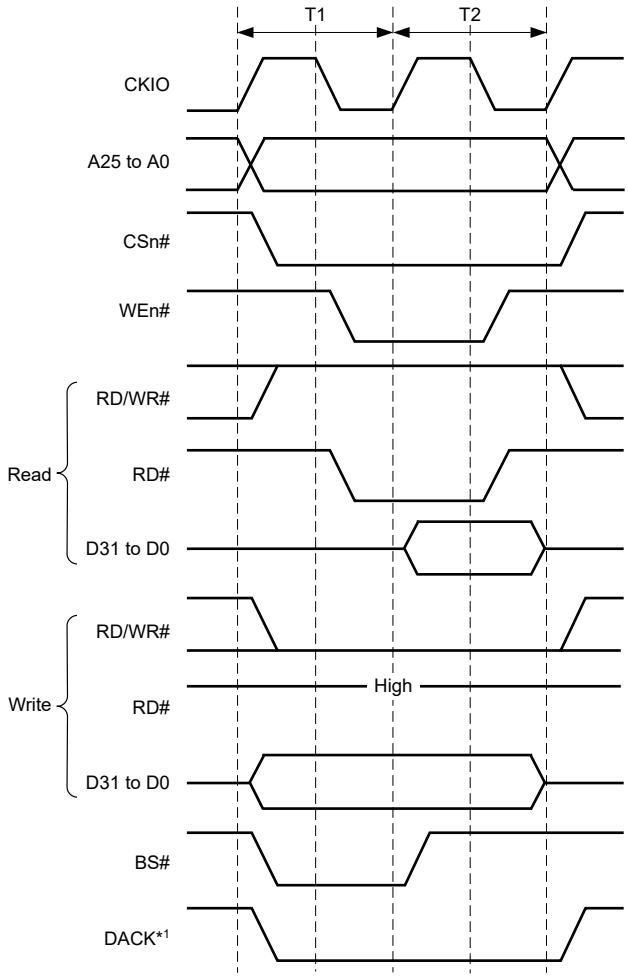
14.5.7 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (WEn#) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB# and LB#.

When the BAS bit in CSnWCR is cleared to 0 (value after reset), the write access timing of the SRAM interface with byte selection is the same as that for the SRAM interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the WEn# pin, which is different from that for the SRAM interface. The basic access timing is shown in Figure 14.16. In write access, data is written to the memory according to the timing of the byte-selection pin (WEn#). For details, please see the Data Sheet for the corresponding memory.

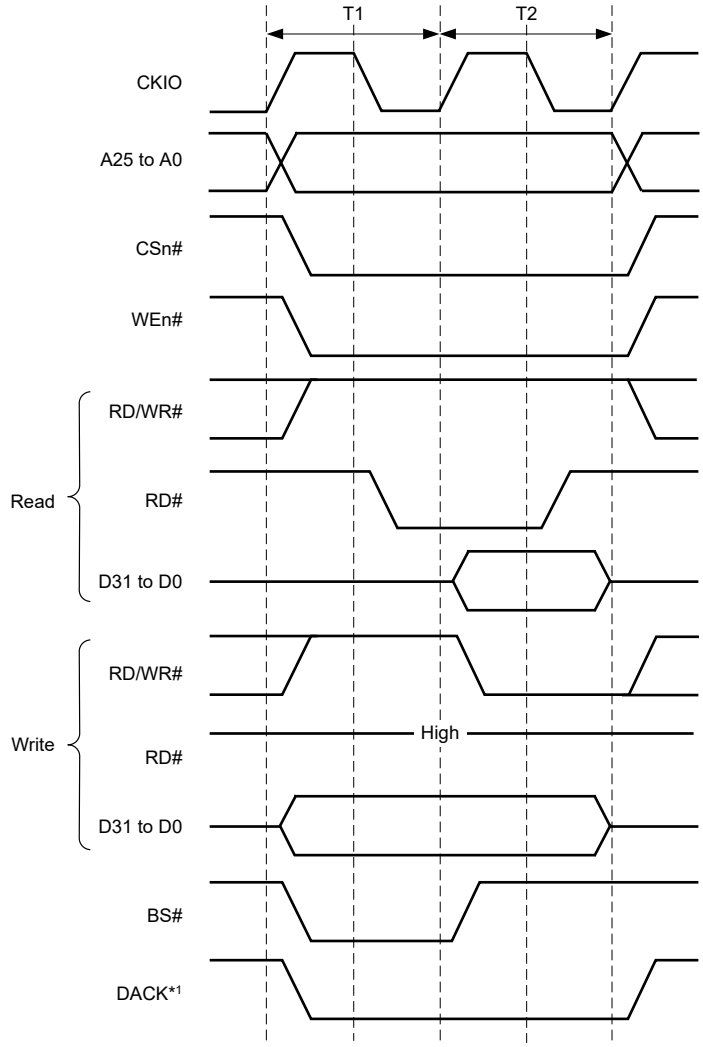
If the BAS bit in CSnWCR is set to 1, the WEn# pin and RD/WR# pin timings change. Figure 14.17 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/WR#).

The data hold of write data at the timing of RD/WR# inactive must be acquired by setting the HW1 and HW0 bits in the CSnWCR register. Figure 14.18 shows the access timing when a software wait is specified.



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.16 Basic access timing for SRAM with byte selection (BAS = 0)



Note 1. The waveform for DACKn is when active-low is specified.

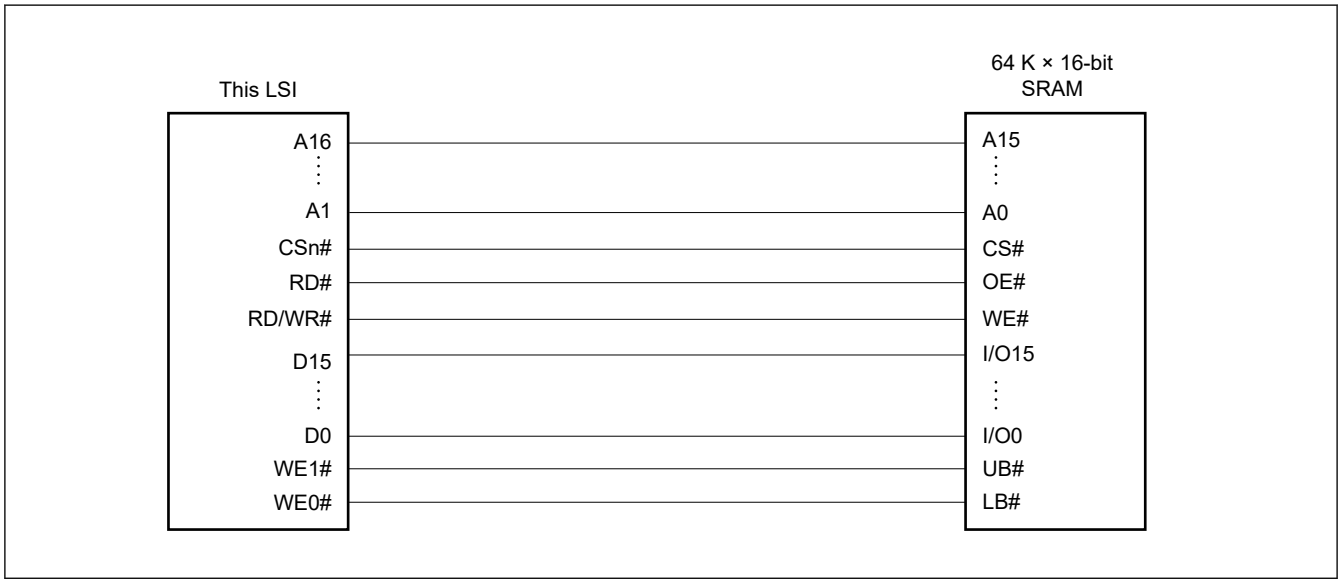

Figure 14.20 Example of connection with 16-bit data-width SRAM with byte selection

14.5.8 Burst ROM (Clocked Synchronous) Interface

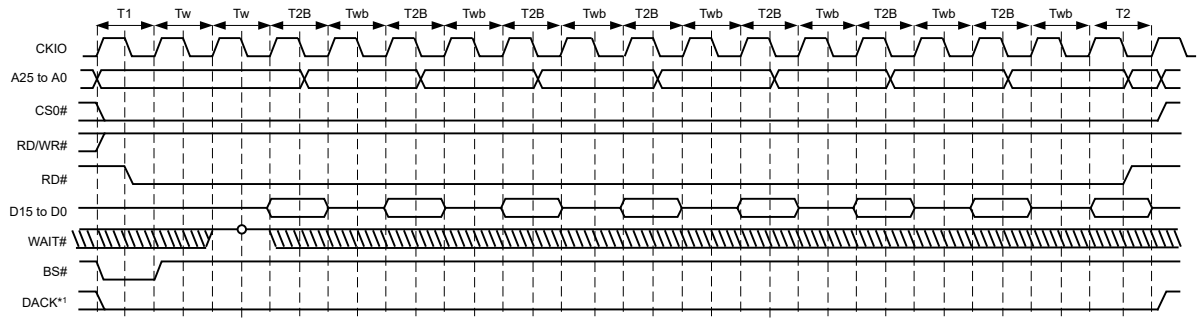
The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as an SRAM interface. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the BS# signal is activated only for the first access cycle and an external wait input is also valid for the first access cycle.

When the bus width is 16 bits, the burst length must be specified as 8. When the bus width is 32 bits, the burst length must be specified as 4. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a 32-bit access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a read in a 16-byte or more access size. The burst ROM interface performs write access in the same way as SRAM interface access.



Note 1. The waveform for DACKn is when active-low is specified.

Figure 14.21 Burst ROM access timing (clocked synchronous) (burst length = 8, wait cycles inserted in first access = 2, wait cycles inserted in second and subsequent access cycles = 1)

14.5.9 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the output data buffer for devices with slow access speed often collides with the data output for the next cycle. As a result of these collisions, the reliability of the device might be lowered or malfunctions might occur. Data collisions can be avoided by inserting idle (wait) cycles between continuous access cycles.

The number of idle states between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR. The conditions for setting the idle cycles between access cycles are shown below.

1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space

For the specification of the number of idle cycles between access cycles described above, see the description of each register.

Besides the idle states between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (WEn#). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.

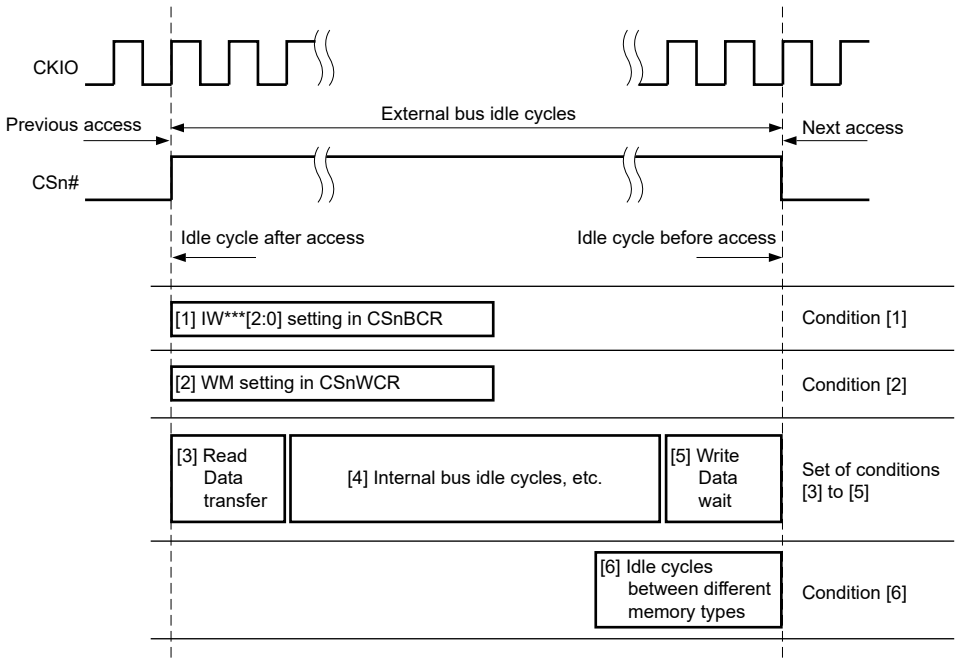
The number of idle cycles on the external bus from the inactive state of the CSn# signal to the active state of CSn# is described below.

There are seven conditions that determine the number of idle cycles on the external bus as shown in Table 14.10. The effects of these conditions are shown in Figure 14.22.

Table 14.10 Conditions for determining number of idle cycles

No.	Condition	Description	Range	Note
[1]	IW***[2:0] in CSnBCR	These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS2 space followed by reading other CS space, the bits IWRRD[2:0] in CS2BCR should be set to 100b to specify six or more idle cycles. This condition is effective only for access states other than single address transfer and generates idle states after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[2]	WM in CSnWCR	This bit enables or disables external WAIT# pin input. When this bit is cleared to 0 (external WAIT# enabled), one idle state is inserted to check the external WAIT# pin input after the access is completed. When this bit is set to 1 (disabled), no idle state is generated.	0 or 1	—
[3]	Read data transfer cycle	One idle state is inserted after a read access is completed. This idle state is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not 00b.	0 or 1	—
[4]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller (DMA) and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO.
[5]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through the CSnBCR register.
[6]	Idle cycles between different memory types	To ensure the minimum pulse width on the multi-use pins, idle cycles may be inserted before access after memories are switched. For some memory types, idle cycles are inserted even when memory types are not switched.	0 to 2	The number of idle cycles depends on the target memory types. See Table 14.11.

In the above conditions, a total of four conditions, that is, condition [1], condition [2], a set of conditions [3] to [5] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [7] are generated at the same time. The maximum number of idle cycles among these four conditions becomes the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].



Note: A total of four conditions (condition [1], condition [2], a set of conditions [3] to [5], and condition [6]) generate idle cycle at the same time. Accordingly, the maximum number of cycles among these four conditions become the number of idle cycles.

Figure 14.22 Idle cycle conditions

Table 14.11 Number of idle cycles inserted between access cycles to different memory types

Previous cycle	Next Cycle					
	SRAM	Burst ROM (asynchronous)	MPX-I/O	Byte SRAM (BAS = 0)	Byte SRAM (BAS = 1)	Burst ROM (synchronous)
SRAM	0	0	1	0	0/1*1	0
Burst ROM (asynchronous)	0	0	1	0	0/1*1	0
MPX-I/O	1	1	0	1	1	1
Byte SRAM (BAS = 0)	0	0	1	0	0/1*1	0
Byte SRAM (BAS = 1)	0/1*1	0/1*1	1/2*1	0/1*1	0	0/1*1
Burst ROM (synchronous)	0	0	1	0	1	0

Note 1. The number of idle cycles depends on the setting of the CSnWCR.HW[1:0] bits in the previous cycle. When HW[1:0] ≠ 00b, the number of idle cycles is the value on the left; when HM[1:0] = 00b, the number of idle cycles is the value on the right. If the CSnWCR.HW[1:0] bits were for a CSn space that does not exist in the previous cycle, the number of idle cycles is the value on the right.

14.5.10 Others

(1) Reset

This module can be initialized completely only at reset of the entire chip (pin reset, software reset, and error reset).

When reset of the entire chip occurs, all signals are inactivated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In the module stop state, control registers of the bus state controller are not initialized.

(2) Caution on Write Buffer

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller (DMA). Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

15. DMA Controller (DMAC)

15.1 Overview

The LSI contains Direct Memory Access Controller (DMAC) consisting of three units, DMAC0 to DMAC2.

DMAC transfers data without using the CPU. When a transfer is requested, DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 15.1 lists the specifications of DMAC.

Table 15.1 DMAC specifications

Parameter		Description	
		DMAC0	DMAC1, DMAC2
Number of channels		16 channels	16 channels
Address space		4 GB	
DMAC activation source		• External request (DREQ) • External interrupts (IRQ0 to IRQ13) • On-chip peripheral module requests/software requests*1	
Channel priority		• Priority among channels: Fixed priority levels within the group of channels 0 to 7 and within the group of channels 8 to 15, respectively, or round-robin scheduling for all channels. • Priority between channel groups: Round-robin scheduling between the group of channels 0 to 7 and the group of channels 8 to 15.	
Transfer data unit		8, 16, 32, 64, 128, 256, and 512 bits	8, 16, 32, 64, 128, and 256 bits
Maximum transfer size		2^{32} - 1 bytes	
Transfer mode	Single transfer	Performs DMA transfer for each DMA transfer request.	
	Block transfer	Performs DMA transfer of the specified transfer size for a DMAC activation request.	
DMA mode	Register mode	• DMA transfer setting value: Control register value within the DMA controller • DMA transfer from the source to the destination specified by a register.	
	Link mode	• DMA transfer setting value: Descriptors in the internal RAM or an external memory • Various DMA transfers specified by descriptors can be performed (responsiveness: register mode > link mode).	
Interval function		The DMA transfer interval can be specified (bus occupation ratio can be adjusted).	
Suspending function		Current DMA transfer can be paused.	
Buffer flush function		When DMAC is stopped forcibly, data in the buffer can be flushed.	
Interrupt request		Each channel has the following interrupt requests: • Transfer completion: Indicates completion of transfer of the specified size; each channel has this source. • Transfer error: Indicates a bus error; total of three sources, one for each unit.	

Note 1. A software request is output as a source of an on-chip peripheral module request from the interrupt controller. For how to set a software request, see section 12, Interrupt Controller (ICU).

Table 15.2 lists the input/output pins of the DMAC.

Table 15.2 Pin configuration of DMAC

Pin name	I/O	Description
DREQ	Input	DMA transfer request input from an external device to DMAC
DACK	Output	Output of DMAC transfer request acceptance from DMAC to an external device
TEND	Output	Output of transfer completion from DMAC to an external device

Note: For details on active levels of DACK and TEND, see section 15.3.12. CMNCR : Common Control Register.

15.3 Register Descriptions

15.3.1 NmSA_n : Nextm Source Address Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x000 + 0x40 × n (m = 0) (n = 0 to 7)
0x400 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x00C + 0x40 × n (m = 1) (n = 0 to 7)
0x40C + 0x40 × (n - 8) (m = 1) (n = 8 to 15)

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Source Address Sets the start address of the DMA transfer source.	R/W

Note: During link mode transfer, descriptor read data is set to the N0SA_n register automatically.

The N0SA_n and N1SA_n registers set the DMA transfer source address of DMA channel n (n = 0 to 15). The N0SA_n register is for Next0 Register Set, and the N1SA_n register is for Next1 Register Set.

15.3.2 NmDA_n : Nextm Destination Address Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x004 + 0x40 × n (m = 0) (n = 0 to 7)
0x404 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x010 + 0x40 × n (m = 1) (n = 0 to 7)
0x410 + 0x40 × (n - 8) (m = 1) (n = 8 to 15)

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Destination Address Sets the start address of the DMA transfer destination.	R/W

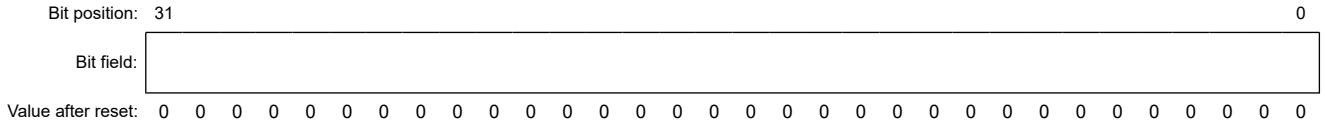
Note: During link mode transfer, descriptor read data is set to the N0DA_n register automatically.

The N0DA_n and N1DA_n registers set the DMA transfer destination address of DMA channel n (n = 0 to 15). The N0DA_n register is for Next0 Register Set, and the N1DA_n register is for the Next1 Register Set.

15.3.3 NmTB_n : Nextm Transaction Byte Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x008 + 0x40 × n (m = 0) (n = 0 to 7)
0x408 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x014 + 0x40 × n (m = 1) (n = 0 to 7)
0x414 + 0x40 × (n - 8) (m = 1) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Transaction Byte Sets the total number of transfer bytes. Do not start DMA transfer when 0 is set.	R/W

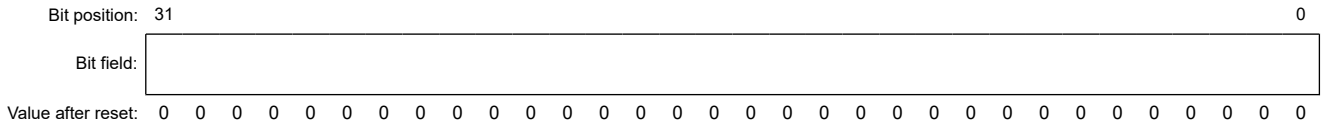
Note: During link mode transfer, descriptor read data is set to the N0TB_n register automatically.

The N0TB_n and N1TB_n registers set the total number of transfer bytes of DMA channel n (n = 0 to 15). The N0TB_n register is for Next0 Register Set, and the N1TB_n register is for Next1 Register Set.

15.3.4 CRSA_n : Current Source Address Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x018 + 0x40 × n (n = 0 to 7)
0x418 + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Current Source Address Displays the read address of the next DMA transfer.	R

The CRSA_n register is a register that displays the DMA transfer source address of DMA channel n (n = 0 to 15). During DMA transfer, the value is incremented automatically (fixed when CHCFG_n.SAD = 1).

The value after a reset is loaded from the following registers:

- In register mode:
  Loads the transfer source address from the Next0/1 register.
- In link mode:
  Loads the transfer source address from the descriptor read data (the hardware inputs the descriptor read data to the N0SA_n register automatically, and loads it to the CRSA_n register when transfer starts).

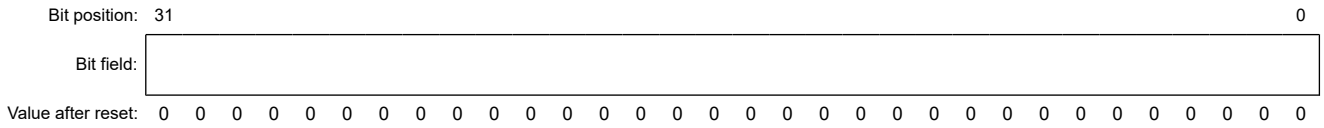
The value is incremented when reading data from the transfer source completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

15.3.5 CRDA_n : Current Destination Address Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x01C + 0x40 × n (n = 0 to 7)
0x41C + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Current Destination Address Displays the write address of the next DMA transfer.	R

The CRDA_n register displays the DMA transfer destination address of DMA channel n (n = 0 to 15).

During DMA transfer, the value is incremented automatically (fixed when CHCFG_n.DAD = 1).

The value after a reset is loaded from the following registers:

- In register mode:
  Loads the transfer destination address from the Next0/1 register.
- In link mode:
  Loads the transfer destination address from the descriptor read data (the hardware inputs the descriptor read data to the N0DA_n register automatically, and loads it to the CRDA_n register when transfer starts).

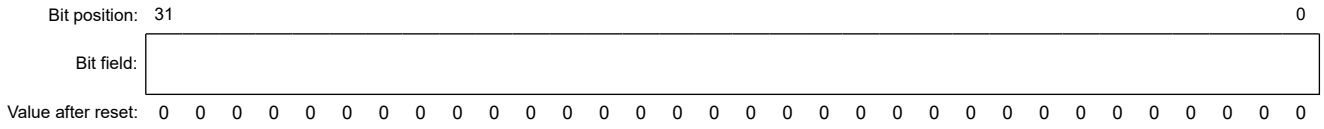
The value is incremented when writing data to the transfer destination completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

15.3.6 CRTB_n : Current Transaction Byte Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x020 + 0x40 × n (n = 0 to 7)
0x420 + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Current Transaction Byte Displays the remaining number of transfer bytes that is currently performed.	R

The CRTB_n register displays the total number of transfer bytes of DMA channel n (n = 0 to 15). The value is cleared to 0 when transfer completes.

During DMA transfer, the value is decremented automatically.

The value after a reset is loaded from the following registers:

- In register mode:
  Loads the number of transfer bytes from the Next0/1 register.
- In link mode:
  Loads the number of transfer bytes from descriptor read data (the hardware inputs the descriptor read data to the N0TB_n register automatically and loads it to the CRTB_n register when transfer starts).

The value is decremented when writing data to the transfer destination completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

15.3.7 CHSTAT_n : Channel Status Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x024 + 0x40 × n (n = 0 to 7)
0x424 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EN	DMA Activation Enable Displays the operation status of DMA channel n. [Setting condition] ● Writing 1 to the SETEN bit in the CHCTRL_n register [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLREN bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register ● When a bus error is reported during transfer ● When all DMA transfers complete in register mode (transfers complete when the REN bit in the CHCFG_n register = 0) ● In link mode, when DMA transfer (write back when WBD = 0) of the last descriptor (LE = 1) completes ● When reading the descriptor in link mode stopped (when LV = 0) 0: Operation disabled 1: Operation enabled	R
1	RQST	DMA Transfer Request This bit indicates that the transfer request is accepted. [Setting condition] ● The transfer request is accepted. [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the SWRST bit in the CHCTRL_n register ● Writing 1 to the STG bit in the CHCTRL_n register ● Writing 1 to the CLRRQ bit in the CHCTRL_n register ● In single transfer (the TM bit in the CHCFG_n register = 0) mode, the transfer specified in the REQD bit in the CHCFG_n register is performed ● When all DMA transfers complete in register mode (transfer completes when the REN bit in the CHCFG_n register = 0) ● In link mode, DMA transfer of the last descriptor (LE = 1) completes ● In link mode, reading the descriptor is disabled (when LV = 0) ● In link mode, the DEM bit in the CHCFG_n register = 0, and DMA transfer completes ● When a bus error is reported to the master interface 0: DMA transfer request not accepted 1: DMA transfer request accepted	R

Bit	Symbol	Function	R/W
2	TACT	DMAC Operating Status This bit indicates that DMAC is running. This bit is used to ensure the channel stops completely. For details, see section 15.4.9. DMA Transfer Status. [Setting condition] ● Writing 1 to the SETEN bit in the CHCTRL_n register (reading the descriptor starts, or the DMA request is being serviced). [Clearing condition] ● When the internal state is idling (the EN bit in the CHSTAT_n register is cleared to 0, and all DMA transfer completes). 0: DMA in Channel_n stops 1: DMA in Channel_n is running	R
3	SUS	Suspend This bit indicates that the channel is suspended. For details, see section 15.4.10. Suspending a Transfer. [Setting condition] ● Writing 1 to the SETSUS bit in the CHCTRL_n register during DMA transfer of Channel_n, and the internal state is changed to the suspended state [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRSUS bit in the CHCTRL_n register ● Writing 1 to the CLREN bit in the CHCTRL_n register ● Condition for clearing the EN bit in the CHSTAT_n register 0: Channel_n not suspended 1: Channel_n suspended	R
4	ER	DMA Error This bit indicates that a DMA error interrupt is generated as a result of the bus error during DMA transfer. [Setting condition] ● A bus error is reported to the bus cycle [Clearing condition] ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: No bus error occurred 1: A bus error occurred	R
5	END	DMA Transfer Completion Interrupt This bit indicates that DMA transfer completes, and a DMA interrupt is generated. [Setting conditions] When any of the following conditions is met: ● When the TC bit setting condition is met while DEM bit in the CHCFG_n register = 0 ● When the descriptor is read in link mode, LV of header = 0, and DIM in the header register = 0 [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLREND bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: DMA transfer not completed 1: DMA transfer completed	R
6	TC	DMA Transfer Completion (total number of data bytes for transaction) This bit indicates that DMA transfer is completed. [Setting conditions] When any of the following conditions is met: ● When a transfer for the total number of data bytes for transaction set in the CRTB_n register is completed in register mode ● When the header bit WBD = 1 in link mode, and a transfer for the total number of data bytes for transaction set in the CRTB_n register is completed ● When the header bit WBD = 0 in link mode, and write-back to the descriptor is completed [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRTC bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: DMA transfer not completed 1: DMA transfer completed	R

Bit	Symbol	Function	R/W
7	SR	Next Register Select In register mode, this bit indicates the selected register set. [Setting condition] ● Setting 1 to the RSEL bit in the CHCFG_n register [Clearing condition] ● Clearing the RSEL bit in the CHCFG_n register to 0 0: Next0 register set 1: Next1 register set	R
8	DL	Descriptor Load This bit indicates that the descriptor is being read. In addition, if a bus error is reported while the descriptor is being read, 1 is retained. [Setting condition] ● Reading the descriptor in link mode is started [Clearing conditions] When any of the following conditions is met: ● Reading the descriptor in link mode completes with the OK response ● Writing 1 to the SWRST bit in the CHCTRL_n register (if 1 is retained for the bus error, it can be cleared to 0 only by the SWRST bit) 0: The descriptor is not being read 1: When ER = 0 The descriptor is being read in link mode When ER = 1 A bus error occurred while the descriptor is being read in link mode	R
9	DW	Descriptor Write Back This bit indicates that the descriptor is being written back. In addition, if a bus error is reported while the descriptor is written back, 1 is retained. [Setting condition] ● Writing back of header in link mode is started [Clearing conditions] ● Writing back of header in link mode completes with the OK response ● Writing 1 to the SWRST bit in the CHCTRL_n register (if 1 is retained due to the bus error, it can be cleared to 0 only by the SWRST bit) 0: Header is not written back in link mode 1: The ER bit in the CHSTAT_n register = 0 Header is written back in link mode The ER bit in the CHSTAT_n register = 1 A bus error occurred when header is written back in link mode	R
10	DER	Descriptor Error This bit indicates that the read descriptor is invalid (LV = 0) (does not depend on the value of the DIM bit in the header register). [Setting condition] ● In link mode, the LV of the read descriptor is 0 [Clearing conditions] When the following condition is met: ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: No descriptor error occurred 1: Descriptor error occurred	R
11	MODE	DMA Mode This bit indicates DMA mode and displays the setting value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode	R
15:12	—	These bits are read as 0.	R
16	INTM	DMA Transfer Completion Interrupt Request Mask This bit displays the temporary mask status of DMA interrupt output. [Setting condition] ● Writing 1 to the SETINTM bit in the CHCTRL_n register [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRINTM bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: The temporary mask status is cleared 1: Temporary mask status	R
31:17	—	These bits are read as 0.	R

Note:
- Handle the transfer as invalid when CHSTAT_n.ER is set to 1.
- To suspend DMA transfer, mask or clear the transfer request, or clear CHSTAT_n.EN. See section 15.4.11. Aborting a Transfer for the procedure).
- To request a transfer by software, make sure that the previously requested DMA transfer operation completes (by checking the current register), set the STG bit in the Channel Control Register n (CHCTRL_n), then activate DMA.
- When DMA transfer for the same channel is requested by both hardware and software, the DMA transfer request cannot be identified for which. Therefore, set the DMA transfer request on your system to either hardware or software.

The CHSTAT_n register displays the status of DMA channel n (n = 0 to 15).

15.3.8 CHEXT_n : Channel Extension Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x034 + 0x40 × n (n = 0 to 7)
0x434 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DCA[3:0]				—	DPR[2:0]			SCA[3:0]				—	SPR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPR[2:0]	Source PROT These bits set the value to be output to the PROT[2:0] pins during DMA read transfer.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
7:4	SCA[3:0]	Source CACHE These bits set the value to be output to the CACHE[3:0] pins during DMA read transfer.	R/W
10:8	DPR[2:0]	Destination PROT These bits set the value to be output to the PROT[2:0] pins during DMA write transfer.	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
15:12	DCA[3:0]	Destination CACHE These bits set the value to be output to the CACHE[3:0] pins during DMA write transfer.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The CHEXT_n register is an extension register for DMA channel n.

15.3.9 DMAC0_RSSELi : DMAC Unit 0 Resource Select Register i (i = 0 to 5)

Base address: DMA = 0x802A_07D0

Offset address: 0x00 + 0x04 × i

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	REQ_SELC[9:0]										REQ_SELB[9:0]										REQ_SELA[9:0]									
Value after reset:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
9:0	REQ_SELA[9:0]	DMA Resource Select for Channel n Select the trigger source of the DMA channel. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W

Bit	Symbol	Function	R/W
19:10	REQ_SELB[9:0]	DMA Resource Select for Channel n + 1 Select the trigger source of the DMA channel. When i = 5, the REQ_SELB[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
29:20	REQ_SELC[9:0]	DMA Resource Select for Channel n + 2 Select the trigger source of the DMA channel. When i = 5, the REQ_SELC[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note:
- Relationship between register number and channel number is n = i × 3.
- The [29:10] bits in the DMAC0_RSSEL5 register are read as 0. The write value should be 0.

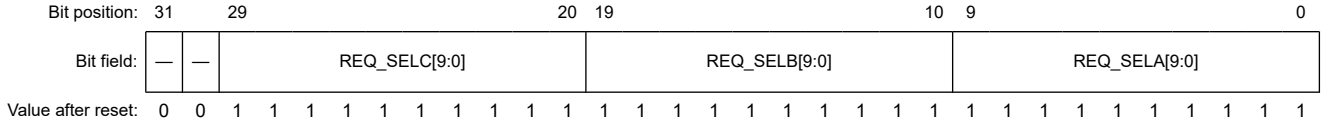
The DMAC0_RSSELi register selects the activation trigger source for DMAC unit 0. For details on numbers that are selected by this source selection, see the event numbers listed in section xx.xx.xx Event Table.

In addition, do not set the same source for multiple DMAC0_RSSELi, DMAC1_RSSELi, and DMAC2_RSSELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

15.3.10 DMAC1_RSSELi : DMAC Unit 1 Resource Select Register i (i = 0 to 5)

Base address: DMA = 0x802A_07D0

Offset address: 0x18 + 0x04 × i



Bit	Symbol	Function	R/W
9:0	REQ_SELA[9:0]	DMA Resource Select for Channel n Select the trigger source of the DMA channel. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
19:10	REQ_SELB[9:0]	DMA Resource Select for Channel n + 1 Select the trigger source of the DMA channel. When i = 5, the REQ_SELB[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
29:20	REQ_SELC[9:0]	DMA Resource Select for Channel n + 2 Select the trigger source of the DMA channel. When i = 5, the REQ_SELC[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note:
- Relationship between register number and channel number is n = i × 3.
- The [29:10] bits in the DMAC1_RSSEL5 register are read as 0. The write value should be 0.

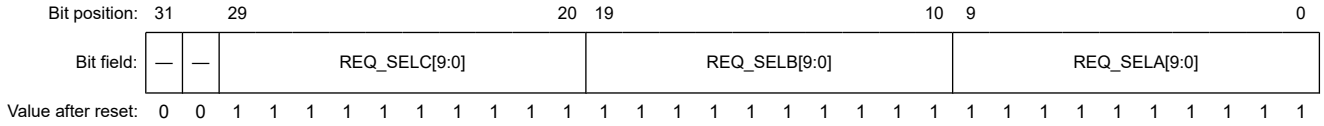
The DMAC1_RSSELi register selects the activation trigger source for DMAC unit 1. For details on numbers that are selected by this source selection, see the event numbers listed in section xx.xx.xx Event Table.

In addition, do not set the same source for multiple DMAC0_RSSELi, DMAC1_RSSELi, and DMAC2_RSSELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

15.3.11 DMAC2_RSSELi : DMAC Unit 2 Resource Select Register i (i = 0 to 5)

Base address: DMA = 0x802A_07D0

Offset address: 0x30 + 0x04 × i



Bit	Symbol	Function	R/W
9:0	REQ_SELA[9:0]	DMA Resource Select for Channel n Select the trigger source of the DMA channel. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
19:10	REQ_SELB[9:0]	DMA Resource Select for Channel n + 1 Select the trigger source of the DMA channel. When i = 5, the REQ_SELB[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
29:20	REQ_SELC[9:0]	DMA Resource Select for Channel n + 2 Select the trigger source of the DMA channel. When i = 5, the REQ_SELC[9:0] bits are invalid. 0x3FF: No resource assignment 0x000: ⋮ 0x3FE: DMA trigger source is assigned (event number)	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note:
- Relationship between register number and channel number is n = i × 3.
- The [29:10] bits in the DMAC1_RSSEL5 register are read as 0. The write value should be 0.

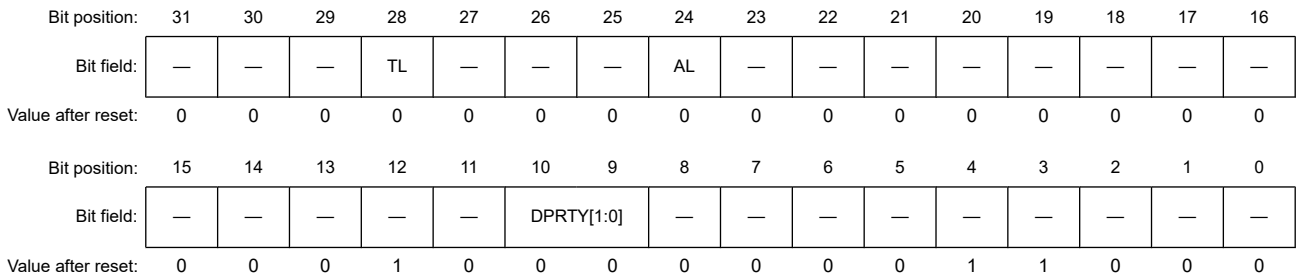
The DMAC2_RSSELi register selects the activation trigger source for DMAC unit 2. For details on numbers that are selected by this source selection, see the event numbers listed in section xx.xx.xx Event Table.

In addition, do not set the same source for multiple DMAC0_RSSELi, DMAC1_RSSELi, and DMAC2_RSSELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

15.3.12 CMNCR : Common Control Register

Base address: BSC = 0x8021_0000

Offset address: 0x00



Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
4:3	—	These bits are read as 1. The write value should be 1.	R/W
8:5	—	These bits are read as 0. The write value should be 0.	R/W
10:9	DPRTY[1:0]	DMA Burst Transfer Priority 0 x: Accept a refresh request during DMA burst transfer 1 0: Do not accept a refresh request during DMA burst transfer 1 1: Setting prohibited	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
12	—	This bit is read as 1. The write value should be 1.	R/W
23:13	—	These bits are read as 0. The write value should be 0.	R/W
24	AL	Acknowledge Level Specify the active level of the DACK signal 0: Active-low output from DACK 1: Active-high output from DACK	R/W
27:25	—	These bits are read as 0. The write value should be 0.	R/W
28	TL	Transfer End Level Specify the active level of the TEND signal 0: Active-low output from TEND 1: Active-high output from TEND	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

The CMNCR register is a 32-bit register that controls the common items from each area.

15.3.13 CHCTRL_n : Channel Control Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x028 + 0x40 × n (n = 0 to 7)
0x428 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRINTM	SETINTM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CLRSUS	SETSUS	—	CLRTC	CLRENDQ	CLRRQ	SWRST	STG	CLREN	SETEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SETEN	DMA Activation Enable Enable DMA transfer of DMA channel n. When this bit is set with the SWRST bit, clearing by the SWRST bit takes precedence, and a transfer does not start. This bit is always read as 0. To reset the DMA register, stop the ongoing DMA transfer by setting the CLREN bit and then set the SETEN bit. 0: Operation is not affected 1: DMA transfer is enabled (the EN bit in the CHSTAT_n register is set)	R/W
1	CLREN	DMA Activation Enable Clear Clear the EN bit in the CHSTAT_n register (for details, see section 15.4.11. Aborting a Transfer). This bit is always read as 0. 0: Operation is not affected 1: DMA transfer is disabled (the EN bit in the CHSTAT_n register is cleared)	R/W

Bit	Symbol	Function	R/W
2	STG	Software Trigger Set a transfer request by software. When this bit is set at the same time as the SWRST bit is being set, clearing by the SWRST bit takes precedence. This bit is always read as 0. 0: Operation is not affected 1: A transfer request is set by software (the RQST bit in the CHSTAT_n register is set)	R/W
3	SWRST	Software Reset Clear each bit in the CHSTAT_n register (for details on the bit to be cleared, see the descriptions of the applicable bit). Set this bit to 0 when the EN bit and the TACT bit are cleared to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear each bit in the CHSTAT_n register	R/W
4	CLRRQ	DMA Transfer Request Clear Clear the RQST bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the RQST bit in the CHSTAT_n register	R/W
5	CLREND	END Clear Clear the END bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the END bit	R/W
6	CLRTC	TC Clear Clear the TC bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the TC bit in the CHSTAT_n register	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
8	SETSUS	Suspend Request If 1 is set to this bit when the EN bit in the CHSTAT_n register is 1, the current DMA transfer is suspended. This bit is always read as 0. 0: Operation is not affected 1: Suspends the current DMA transfer	R/W
9	CLRSUS	Suspend Clear If 1 is set to this bit when the SUS bit in the CHSTAT_n register is 1, the temporary suspend status is cleared. This bit is always read as 0. 0: Operation is not affected 1: Clear the temporary suspend status of the current DMA transfer	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	SETINTM	DMA Transfer Completion Interrupt Request Mask Mask DMA transfer completion interrupt output temporarily. Additionally, the INTM bit in the CHSTATn register is set to 1. This bit is always read as 0. 0: Operation is not affected 1: Mask a DMA transfer completion interrupt temporarily	R/W
17	CLRINTM	DMA Transfer Completion Interrupt Request Mask Clear Clear the mask status of DMA transfer completion interrupt output. Additionally, the INTM bit in the CHSTATn register is cleared to 0. If the mask state is cleared when the LVINT bit in the DCTRL register = 1 and the END bit in the CHSTAT_n register = 1, DMA transfer completion interrupt is deactivated. It is not activated when LVINT = 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the mask state set with the SETINTM bit	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The CHCTRL_n register controls DMA transfer of DMA channel n (n = 0 to 15).

15.3.14 CHCFG_n : Channel Configuration Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x02C + 0x40 × n (n = 0 to 7)
0x42C + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMS	REN	RSW	RSEL	SBE	—	TCM	DEM	—	TM	DAD	SAD	DDS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SDS[3:0]				—	AM[2:0]			—	LVL	HIEN	LOEN	REQD	SEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SEL[2:0]	Pin Select Set channels of DMAC. Set the following values so that the channels of CHCFG_n (n = 0 to 15) and the channel set by SEL become the same. For example, set 001b to the SEL bits in CHCFG_1. 0 0 0: Channel 0/8 0 0 1: Channel 1/9 0 1 0: Channel 2/10 0 1 1: Channel 3/11 1 0 0: Channel 4/12 1 0 1: Channel 5/13 1 1 0: Channel 6/14 1 1 1: Channel 7/15	R/W
3	REQD	DMA Activation Request Source Select Specifies the DMA transfer request input source (internal modules or external devices that require DACK). The timing when DACK becomes active is determined by the setting of this bit. 0: Requested by a transfer source module. DACK output is activated when it is read (a value after a reset). 1: Requested by a transfer destination module. DACK output is activated when it is written.	R/W
4	LOEN	L Detection Enable Specifies the detection method of the DMA request signal. When LVL = 0 LOEN = 1: If DMA transfer request input detects a falling edge, it is regarded as requested. LOEN = 0: If the DMA transfer request input falls, the request is not recognized (a value after a reset). When LVL = 1 LOEN = 1: If DMA transfer request input detects a low level, it is regarded as requested. LOEN = 0: If the DMA transfer request input is a low level, the request is not recognized (a value after reset).	R/W
5	HIEN	H Detection Enable Specifies the detection method of the DMA request signal. When LVL = 0 HIEN = 1: If DMA transfer request input detects a rising edge, it is regarded as requested. HIEN = 0: If the DMA transfer request input rises, the request is not recognized (a value after reset). When LVL = 1 HIEN = 1: If DMA transfer request input detects a high level, it is regarded as requested. HIEN = 0: If the DMA transfer request input is a high level, the request is not recognized (a value after reset).	R/W

Bit	Symbol	Function	R/W
6	LVL	Level Detection Enable Specifies the detection method of the DMA request signal. 0: Detects the edge (a value after reset) 1: Detects the level	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
10:8	AM[2:0]	ACK Mode These bits specify the DACK output mode. For the conditions of outputting the DACK and TEND signals, see section 15.4.5. DMA Acknowledge Output/DMA Transaction Completion Output Function. 0 0 0: Setting is prohibited (a value after reset). At the initial setup, set a value other than 000b. 0 0 1: Level mode (active until DMA transfer request input becomes inactive) 0 1 x: Bus cycle mode (active between DMA transfer cycles (active if internal resources are the target)) 1 x x: Mask DACK output	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
15:12	SDS[3:0]	Source Data Size Set the size of data in the transfer source to be transferred at a time. 0x0: 8 bits (a value after reset) 0x1: 16 bits 0x2: 32 bits 0x3: 64 bits 0x4: 128 bits*1 0x5: 256 bits*2 0x6: 512 bits (can be set only for DMAC0)*1 Others: Setting prohibited	R/W
19:16	DDS[3:0]	Destination Data Size Set the size of data in the transfer destination to be transferred at a time. 0x0: 8 bits (a value after reset) 0x1: 16 bits 0x2: 32 bits 0x3: 64 bits 0x4: 128 bits*1 0x5: 256 bits*2 0x6: 512 bits (can be set only for DMAC0)*1 Others: Setting prohibited	R/W
20	SAD	Source Address Count Direction Set the count direction of the transfer source address of DMA channel n. When the transfer source address is beat-unaligned, specify SAD = 0 (increment). When the transfer source address is aligned with a boundary of the size specified by the SDS[3:0] bits, SAD can be set to 0 or 1. 0: Increment (a value after reset) 1: Fixed	R/W
21	DAD	Destination Address Count Direction Set the count direction of the transfer destination address of DMA channel n. When the transfer destination address is beat-unaligned, specify DAD = 0 (increment). When the transfer destination address is aligned with a boundary of the size specified by the DDS[3:0] bits, DAD can be set to 0 or 1. 0: Increment (a value after reset) 1: Fixed	R/W
22	TM	Transfer Mode Set DMA transfer mode. 0: Single transfer mode (a value after reset) 1: Block transfer mode	R/W
23	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
24	DEM	DMA Transfer Completion Interrupt Mask Mask DMA transfer completion interrupt detection. If this bit is set to 1 when DMA transfer completion interrupt is output, DMA transfer completion interrupt is not activated. At this time, the DEM bit is automatically cleared to 0. [Clearing condition] ● When DEM = 1 and DMA transfer completes 0: Does not mask (a value after reset) 1: Mask	R/W
25	TCM	TEND Mask Mask the TEND output. If this bit is 1 at the TEND output timing, TEND is not asserted. At this time, the TCM bit is automatically cleared to 0. Use this bit to control DMA transfers by software. [Clearing condition] ● When TCM = 1 and DMA transfer completes 0: Does not mask (a value after reset) 1: Mask	R/W
26	—	This bit is read as 0. The write value should be 0.	R/W
27	SBE	Buffer Flush Enable If the EN bit in the CHSTAT_n register is cleared to 0 during DMA transfer, select whether to stop flushing (writing) data that is already read and stored in the buffer. Only when REQD = 0, flush mode can be used. 0: Stop transfer without flushing data in the buffer (a value after reset) 1: Stop transfer after flushing data in the buffer	R/W
28	RSEL	Next Register Select Select the Next register set to be executed next. This bit is valid in register mode only. When RSW = 1, the value is reversed automatically (0 is reversed to 1, 1 is reversed to 0) after DMA transfer completes. [Transition condition] ● When RSW = 1 and DMA transfer completes 0: Execute Next0 Register Set (a value after reset) 1: Execute Next1 Register Set	R/W
29	RSW	RSEL Reverse When DMA transfer completes, the RSEL bit is automatically reversed (0 is reversed to 1, 1 is reversed to 0). This bit is valid in register mode only. 0: Does not reverse the RSEL bit when DMA transfer completes (a value after reset) 1: Reverse the RSEL bit when DMA transfer completes	R/W
30	REN	Register Set Enable When DMA transfer completes, performs DMA transfer of the Next register set selected by the RSEL bit accordingly. This bit is valid in register mode only. [Setting condition] ● Writing 1 to this bit [Clearing conditions] When any of the following conditions is met: ● Writing 0 to this bit ● When REN = 1 and DMA transfer completes 0: Does not perform DMA transfer accordingly 1: Performs DMA transfer accordingly	R/W
31	DMS	DMA Mode Select Set DMA mode. 0: Register mode (a value after reset). 1: Link mode	R/W

Note 1. The SCA[3:0] bits in the CHEXT_n register should be set to 0x2 if source is TCM. The DCA[3:0] bits in the CHEXT_n register should be set to 0x2 if destination is TCM.
Note 2. This setting is prohibited when DMAC accesses TCM.

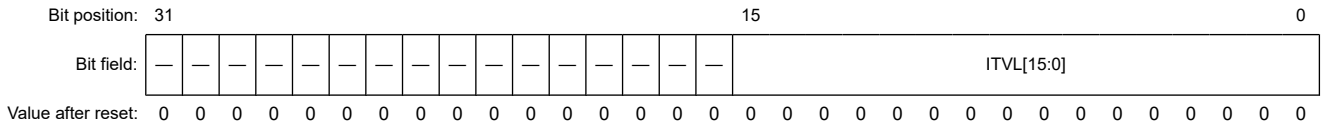
The CHCFG_n register controls DMA transfer of DMA channel n (n = 0 to 15).

Specify the detection method depending on the DMA transfer source to be used. For details on the DMA request signals, see section 15.4.4.1. Specifying Detection Operation of DMA Transfer Requests for Each Source.

15.3.15 CHITVL_n : Channel Interval Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x030 + 0x40 × n (n = 0 to 7)
0x430 + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
15:0	ITVL[15:0]	Interval These bits set the DMA transfer internal.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

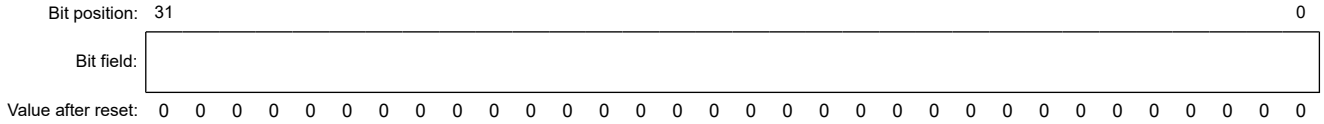
The CHITVL_n register sets the DMA transfer interval of DMA channel n (n = 0 to 15).

For details, see section 15.4.7. Interval Count Function.

15.3.16 NXLA_n : Next Link Address Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x038 + 0x40 × n (n = 0 to 7)
0x438 + 0x40 × (n - 8) (n = 8 to 15)



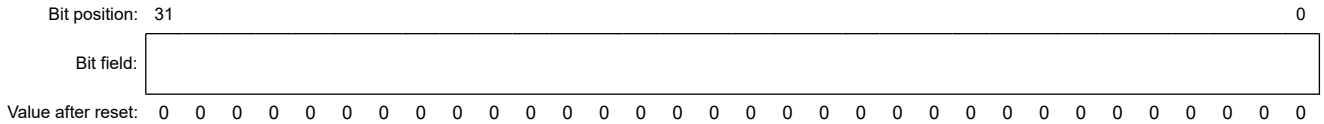
Bit	Symbol	Function	R/W
31:0	n/a	Next Link Address Sets the address of the link destination. Because the 2 lower-order bits are fixed to 0, only word-aligned addresses can be set.	R/W

The NXLA_n register sets the link address of DMA channel n (n = 0 to 15).

15.3.17 CRLA_n : Current Link Address Register n (n = 0 to 15)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x03C + 0x40 × n (n = 0 to 7)
0x43C + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Current Link Address Displays the address of the descriptor that is being executed.	R

The CRLA_n register sets the link address of DMA channel n (n = 0 to 15).

15.3.18 DCTRL_x : DMA Control Register x (x = A, B)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x300 (DCTRL_A)
0x700 (DCTRL_B)

Bit position:	31																												1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVINT	PR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Priority Control Select Sets the transfer priority control mode (see section 15.4.3. DMA Channel Priority Control. 0: Fixed priority mode 1: Round-robin mode	R/W
1	LVINT	DMA Interrupt Output Select Sets the interrupt output mode. 0: Pulse output 1: Level output	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The DCTRL_x register sets the arbitration between channels in all channels (DCTRL_A = channels 0 to 7, DCTRL_B = channels 8 to 15).

15.3.19 DSTAT_EN_x : DMA Status EN Register x (x = A, B)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x310 (DSTAT_EN_A)
0x710 (DSTAT_EN_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	EN0715	EN0614	EN0513	EN0412	EN0311	EN0210	EN0109	EN0008

Bit field:	—	—	—	—	—	—	—	—	END0715	END0614	END0513	END0412	END0311	END0210	END0109	END0008
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	END0008	Channel 0/8 END Displays the status for the END bit of DMA channel 0/8.	R
1	END0109	Channel 1/9 END Displays the status for the END bit of DMA channel 1/9.	R
2	END0210	Channel 2/10 END Displays the status for the END bit of DMA channel 2/10.	R
3	END0311	Channel 3/11 END Displays the status for the END bit of DMA channel 3/11.	R
4	END0412	Channel 4/12 END Displays the status for the END bit of DMA channel 4/12.	R
5	END0513	Channel 5/13 END Displays the status for the END bit of DMA channel 5/13.	R
6	END0614	Channel 6/14 END Displays the status for the END bit of DMA channel 6/14.	R
7	END0715	Channel 7/15 END Displays the status for the END bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_END_x register displays the status for the END bit of all channels (DSTAT_END_A = channels 0 to 7, DSTAT_END_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

15.3.22 DSTAT_SUS_x : DMA Status SUS Register x (x = A, B)

Base address: DMACi = 0x800C_0000 + 0x1000 × i (i = 0 to 2)

Offset address: 0x320 (DSTAT_SUS_A)
0x720 (DSTAT_SUS_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SUS0715	SUS0614	SUS0513	SUS0412	SUS0311	SUS0210	SUS0109	SUS0008
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SUS0008	Channel 0/8 SUS Displays the status for the SUS bit of DMA channel 0/8.	R
1	SUS0109	Channel 1/9 SUS Displays the status for the SUS bit of DMA channel 1/9.	R
2	SUS0210	Channel 2/10 SUS Displays the status for the SUS bit of DMA channel 2/10.	R
3	SUS0311	Channel 3/11 SUS Displays the status for the SUS bit of DMA channel 3/11.	R
4	SUS0412	Channel 4/12 SUS Displays the status for the SUS bit of DMA channel 4/12.	R
5	SUS0513	Channel 5/13 SUS Displays the status for the SUS bit of DMA channel 5/13.	R
6	SUS0614	Channel 6/14 SUS Displays the status for the SUS bit of DMA channel 6/14.	R
7	SUS0715	Channel 7/15 SUS Displays the status for the SUS bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_SUS_x register displays the status for the SUS bit of all channels (DSTAT_SUS_A = channels 0 to 7, DSTAT_SUS_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

15.4 Operation

15.4.1 DMA Mode

With the DMS bit in the CHCFG_n register, DMA mode can be switched between register mode and link mode.

Table 15.5 DMA mode setting

DMS (CHCFG_n)	Description	Applications
0	Register mode	With the values set for the next register set, performs a DMA transfer.
1	Link mode	Accesses the descriptor area, and performs a DMA transfer with the value set for the descriptor. Repeats descriptor read and DMA transfer unless you set the descriptor or use the control register to stop them.

15.4.1.1 Register Mode

In register mode, you can perform a DMA transfer with the value set in the internal register. You can set two sets (Next0 Register Set and Next1 Register Set) of the transfer source addresses, transfer destination addresses, and numbers of transfer bytes. You can select the next register set to perform a transfer, or transfer two next register sets successively.

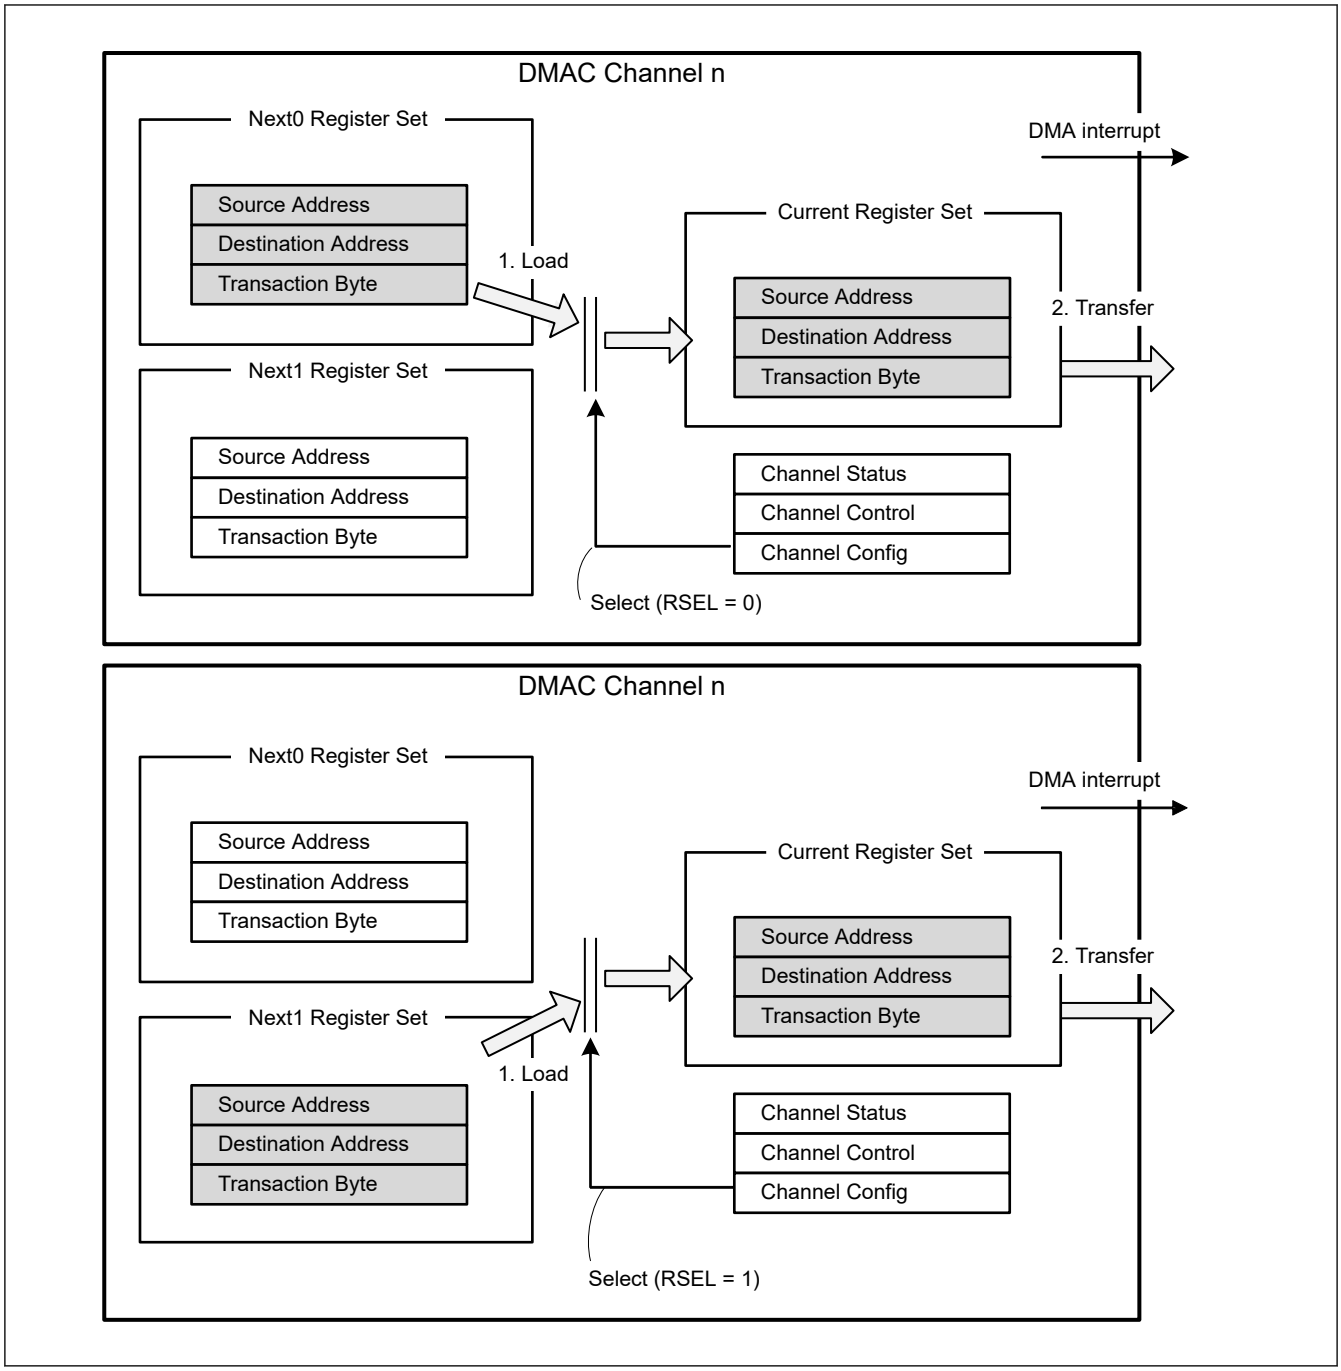

Figure 15.1 Overview of register normal mode

Figure 15.1 shows operations when Next0 Register Set is executed above and when Next1 Register Set is executed below.

(1) Operation Flow in Register Mode

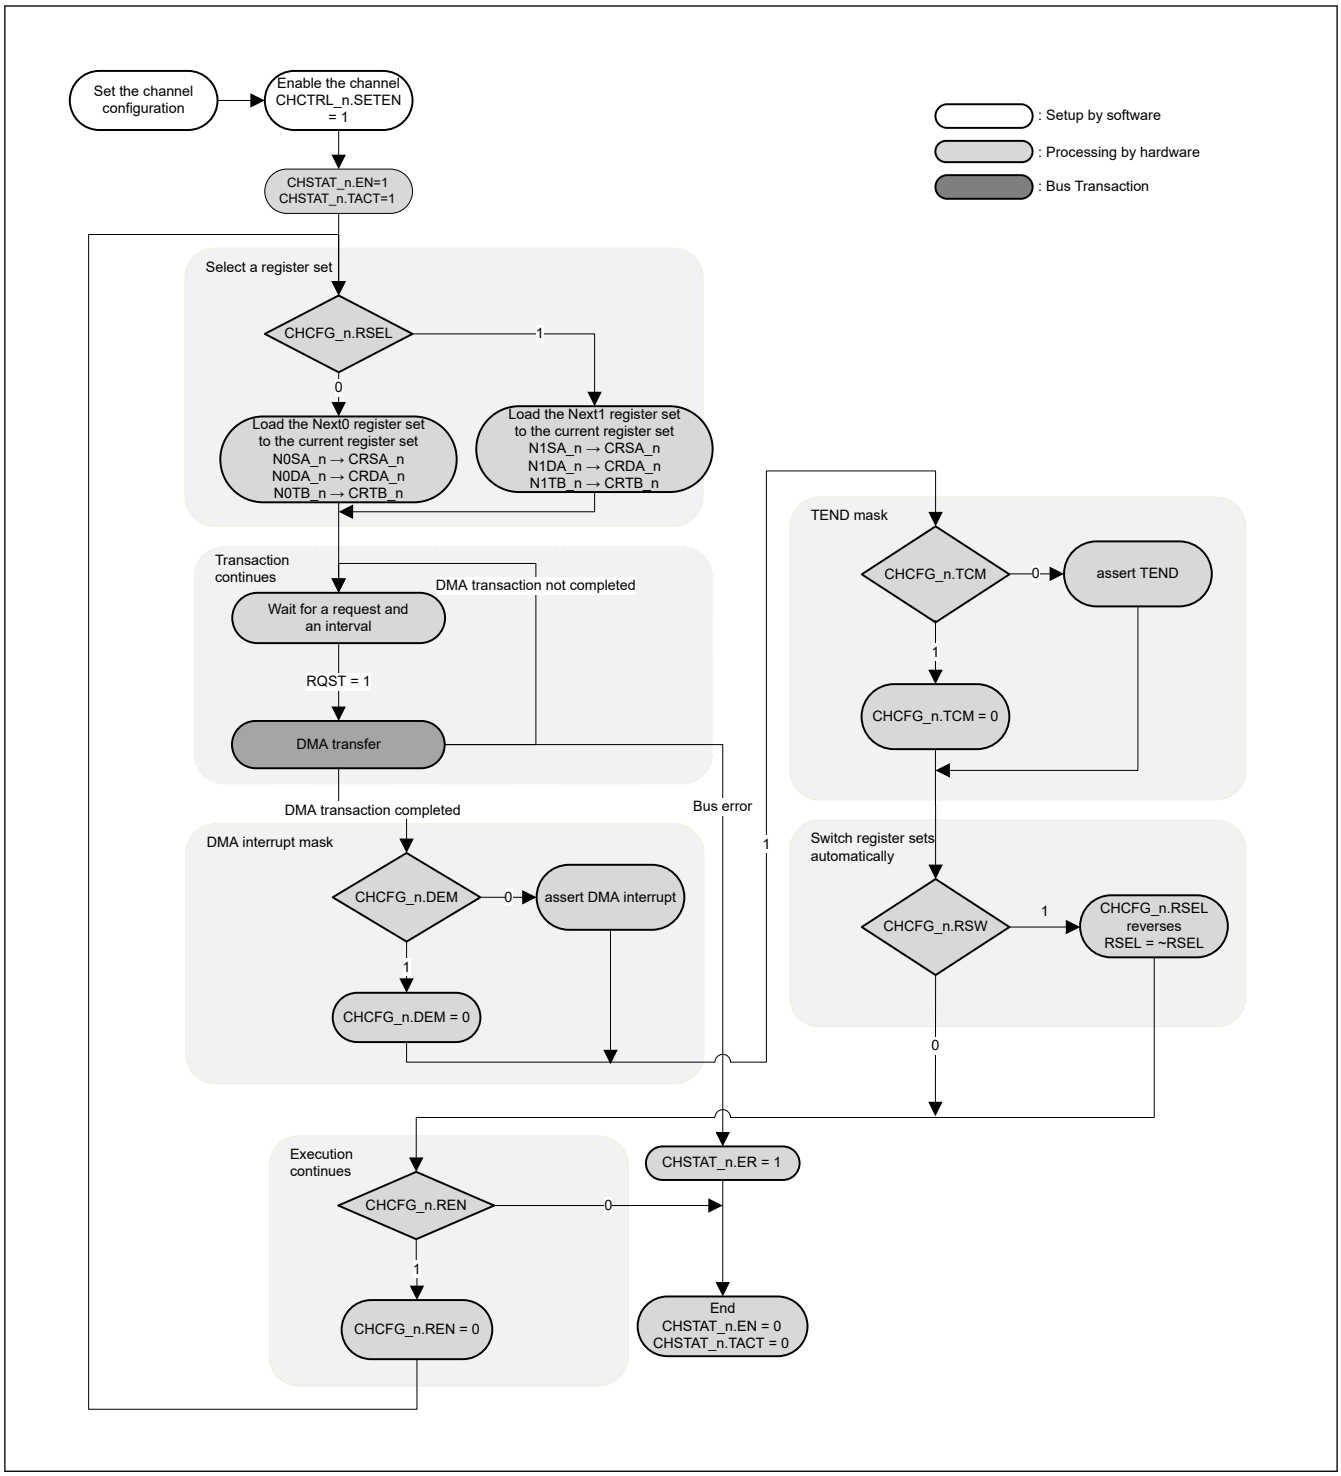

Figure 15.2 Register mode flow

(2) Register Mode Flow Description

1. Channel setting
   Set Next0 or Next1 Register Set (the transfer destination address, the transfer source address, and the total number of transfer bytes).
   In addition, use setting registers CHCTRL_n or CHCFG_n for each channel to set the detection method of the DMA transfer request, the output mode of the DACK/TEND signal, and the amount of data for a transfer.
2. Selecting the register set

When 1 is written to the SETEN bit in the CHCTRL_n register, the EN bit and the TACT bit in the CHSTAT_n register are set to 1, and the setting value of the next register set selected by the RSEL bit in the CHCFG_n register is loaded to the current register set.

3. DMA transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 15.4.2. Transfer Mode to section 15.4.11. Aborting a Transfer.
4. DMA transfer completion mask
   According to the value set for the DEM bit in the CHCFG_n register, the DMA transfer completion interrupt is masked. When DEM = 1, the DMA transfer completion interrupt is masked. Immediately after the DMA transfer completion interrupt conditions are satisfied, the DEM bit is cleared to 0 automatically.
5. TEND mask
   According to the values set for the TCM bit in the CHCFG_n register, the TEND is masked. When TCM = 1, TEND is masked. Immediately, the DMA transfer completes and the TCM bit is cleared to 0 automatically.
6. Switching register sets automatically
   According to the value set for the RSW bit in the CHCFG_n register, the register set is switched to the other next register set.
7. Successive execution
   According to the value set for the REN bit in the CHCFG_n register, DMA transfers are performed successively. When REN = 0, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When REN = 1, the DMA transfer continues. Immediately after the conditions for performing DMA transfer again are satisfied with the REN bit, the REN bit is cleared to 0 automatically.

(3) Setting the Register Mode

Select the register set to execute.

Table 15.6 Register mode settings

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Executes Next0 Register Set
	1	Executes Next1 Register Set

DMA transfer completion interrupts can be masked.

Table 15.7 DMA transfer completion interrupt mask settings

DEM (CHCFG_n)	Description
0	When a DMA transfer completes, the DMA transfer completion interrupt is generated
1	Even if a DMA transfer completes, no DMA transfer completion interrupt is generated. When a DMA transfer completes, the DEM bit is cleared to 0 automatically.

TEND output can be masked.

Table 15.8 TEND output mask settings

TCM (CHCFG_n)	Description
0	When a DMA transfer completes, the TEND is asserted
1	Even if a DMA transfer completes, no TEND is asserted. When a DMA transfer completes, the TCM bit is cleared to 0 automatically.

After a DMA transfer, another DMA transfer can be performed successively.

Table 15.9 Settings for automatic execution of register sets (1 of 2)

REN (CHCFG_n)	Operation	Remarks
0	When a DMA transfer of the register set for the RSEL bit completes, the EN bit is cleared to 0, and the DMA operation ends	Set this value if you want to perform a DMA transfer once

Table 15.9 Settings for automatic execution of register sets (2 of 2)

REN (CHCFG_n)	Operation	Remarks
1	After a DMA transfer completes, a DMA transfer is performed for the register set that was selected to be performed successively. When the successive transfer is performed, the REN bit is cleared to 0.	Set this register if you want to perform register sets successively

When a DMA transfer completes, the register set can be switched to the next register set.

Table 15.10 Settings for switching register sets automatically

RSW (CHCFG_n)	Operation	Remarks
0	When a DMA transfer completes, register sets are not switched	Set this value when you want to use one register set only
1	When a DMA transfer completes, the RSEL bit is reversed automatically, and the other register set is selected	Set this value if you want to switch register sets

(4) Register Mode Setting Examples

Using the Next0 register set only.

Table 15.11 Register mode setting example 1

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (Register mode)	0 (Next0)	0 (Do not mask)	0 (Do not mask)	0 (Do not switch)	0 (Continuous execution not in progress)

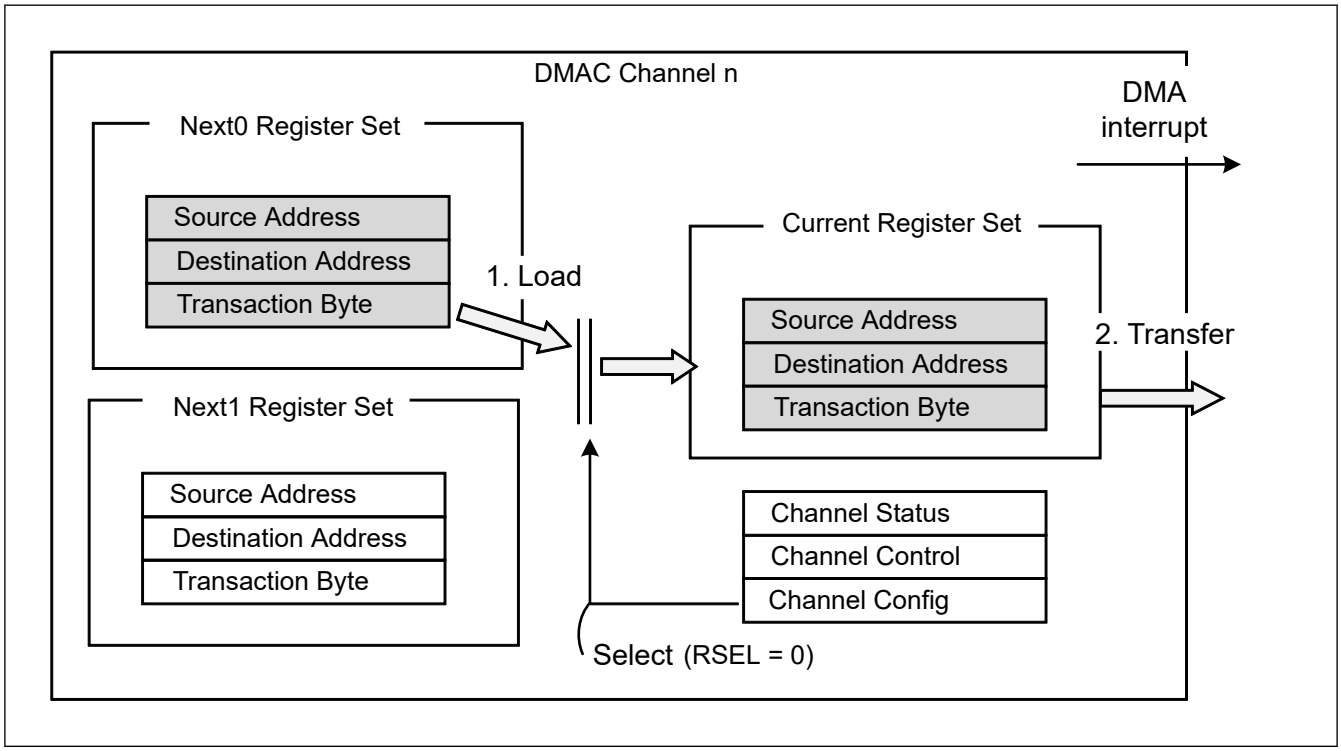

Figure 15.3 Register mode setting example 1

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.
3. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.

4. Because the TCM bit in the CHCFG_n register is 0, the TEND is asserted when DMA transfer completes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

Using two register sets successively.

Table 15.12 Register mode setting example 2

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (Register mode)	0 (Next0)	1 (Mask)	0 (Do not mask)	1 (Switch)	1 (Continuous execution not in progress)

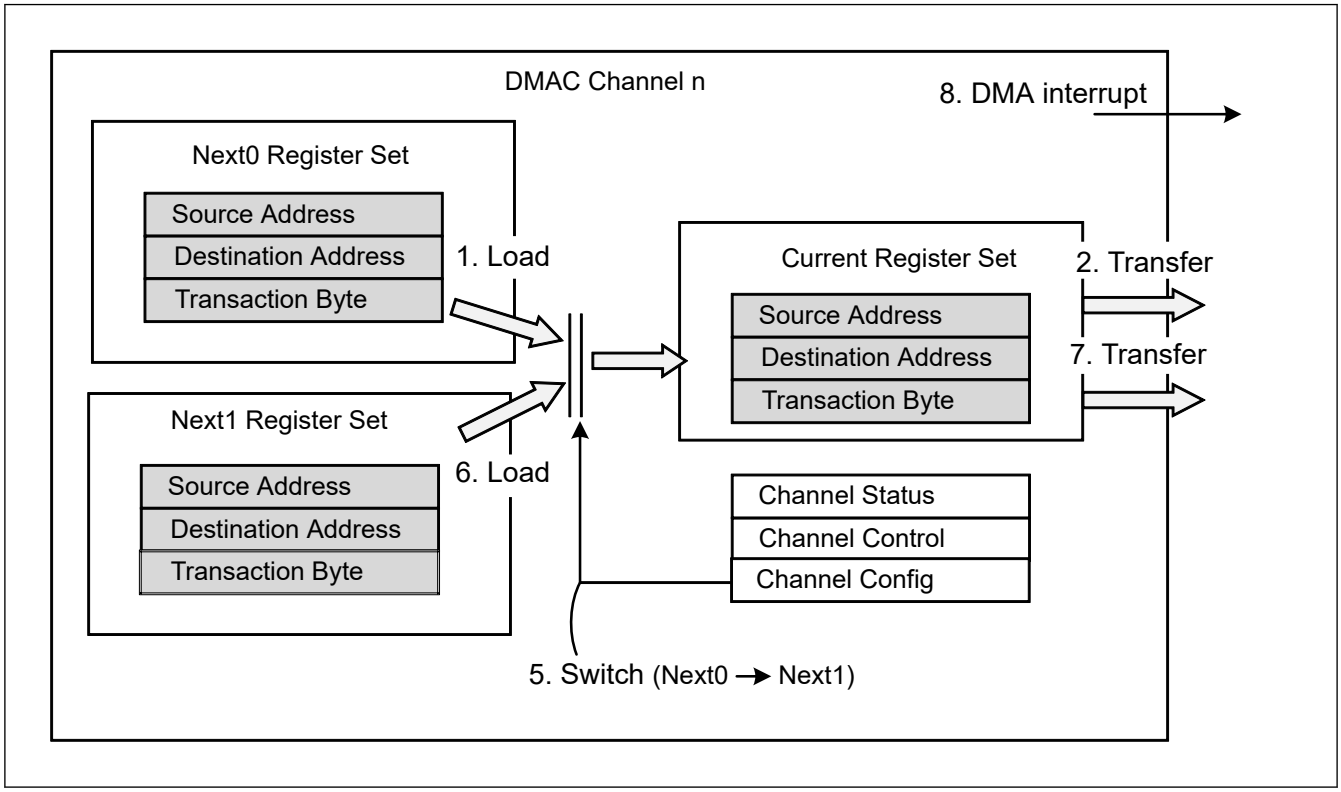

Figure 15.4 Register mode setting example 2

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.
3. Because the DEM bit in the CHCFG_n register is 1, when the DMA transfer completes, no DMA transfer completion interrupt is generated. In addition, the DEM bit is cleared to 0 automatically.
4. Because the REN bit in the CHCFG_n register is 1, DMA transfers are performed successively. In addition, the REN bit is cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the register set to be executed next is switched (RSEL = 0 → 1).
6. Loads Next1 Register Set to Current Register Set.
7. According to the values for Current Register Set and Channel Register Set, DMA transfers are performed.
8. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.
9. Because the TCM bit in the CHCFG_n register is 0, the TEND is asserted when DMA transfer completes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0 automatically.

15.4.1.2 Link Mode

In link mode, a DMA transfer is performed by reading a descriptor in the memory area outside the DMAC as the setting value. Within DMAC, each channel has the next link address (NXLA_n) register and the current link address (CRLA_n) register. Each of them is used to set the address of the descriptor to be executed next and to display the descriptor address of the current DMA transfer respectively.

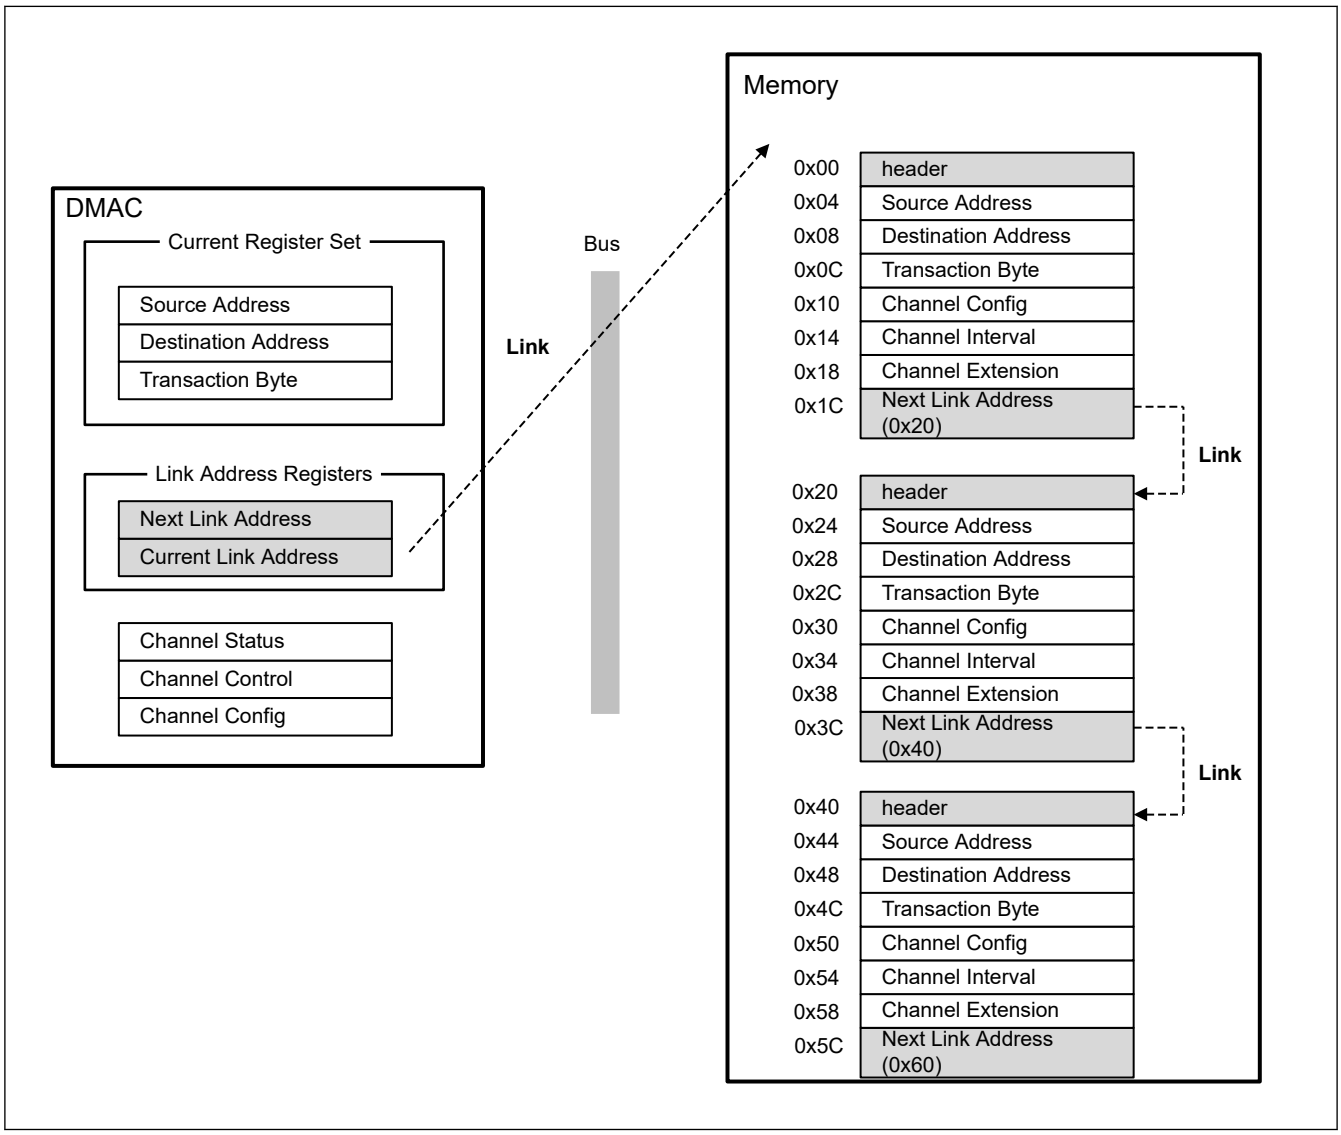

Figure 15.5 Link mode overview

(1) Operation Flows in Link Mode

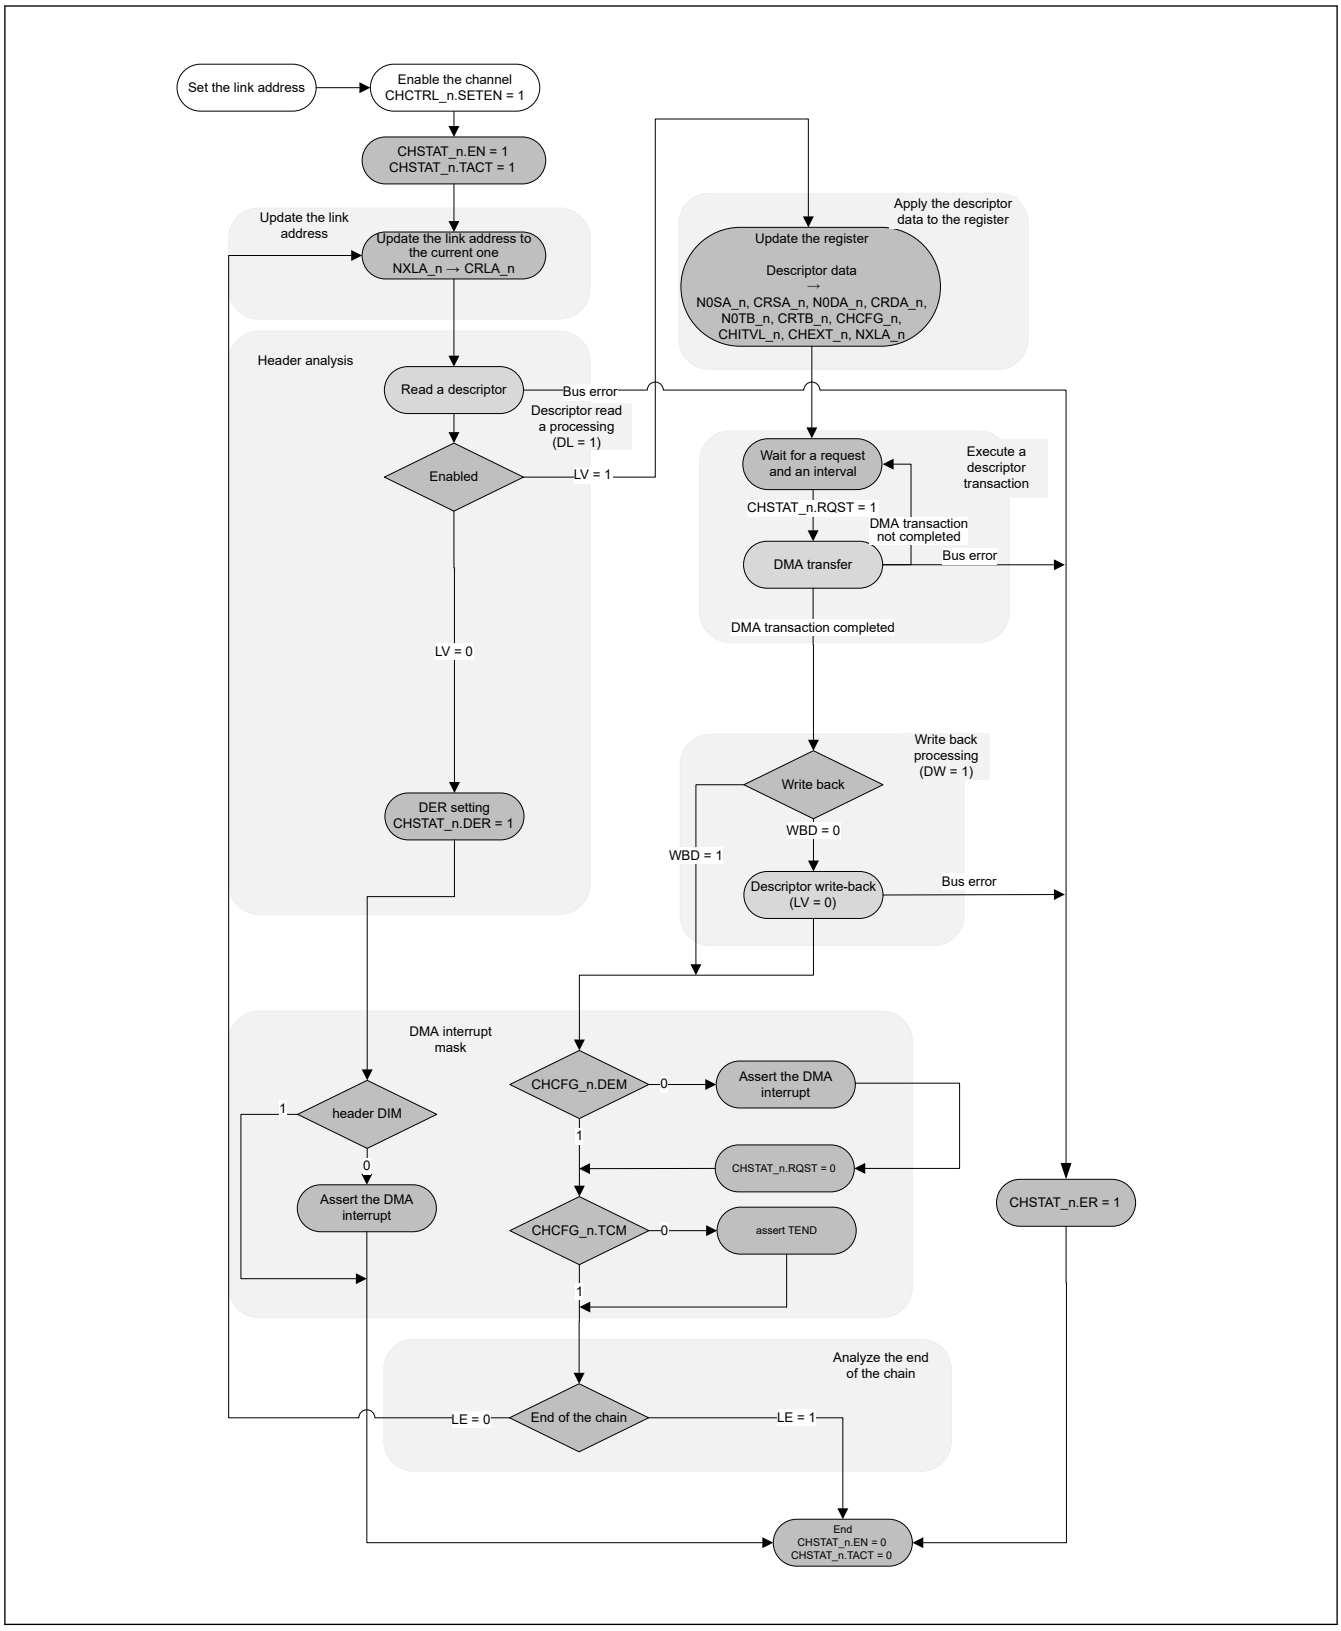

Figure 15.6 Link mode operation flow

(2) Description of Link Mode Operation Flow

1. Channel setting

Set the start address of the link destination in the NXLA_n register.

2. Updating the link address
   Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit and the TACT bit in the CHSTAT_n register, and loads the link address set for the NXLA_n register to the CRLA_n register.
3. Descriptor read and header judgment
   DMAC starts reading a descriptor and checks the header contents. When LV = 0, the descriptor is discarded and the DER bit in the CHSTAT_n register = 1 indicates the end state (the EN bit in the CHSTAT_n register = 0). At that time, if the DIM bit in the header register is 0, a DMA transfer completion interrupt is generated.
4. Descriptor settings
   When LV = 1, the read descriptor data is loaded to the current register set and the channel register set. In addition, the next link destination is loaded to the NXLA_n register.
5. DMA transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 15.4.2. Transfer Mode to section 15.4.11. Aborting a Transfer.
6. Writing back of header
   When WBD of header = 0, DMAC writes LV = 0 back to the header area.
7. DMA interrupt mask
   When the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated. When DMA transfer is performed using multi descriptors, DMA request should be issued again and RQST is set to 1 to continue the DMA transfer because RQST is set to 0 when DEM = 0.
8. TEND mask
   When the TCM bit in the CHCGF_n register is 0, the TEND is generated.
9. Link end judgment
   When LE of header = 1, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When LE = 0, the current register set is updated, and the next descriptor read is started.

(3) Register Settings

When using link mode, set the DMS bit in the CHCFG_n register to 1.

Table 15.13 Link mode settings

DMS (CHCFG_n)	Description
1	Operates in link mode. This bit cannot be changed by using a descriptor.

As registers that indicate the link destination, the next link address (NXLA_n) register and the current link address (CRLA_n) register are available.

To start link mode, set the link destination in the NXLA_n register.

The NXLA_n register is updated to the next link after a descriptor is read. In addition, the CRLA_n register indicates the link address of the currently executed descriptor.

Table 15.14 Link address register set

Register	Description
NXLA_n	Sets and displays the next link destination. Before starting link mode, set the address of the link destination for this register.
CRLA_n	Displays the currently executed link destination. This register is read-only.

(4) Descriptor Settings

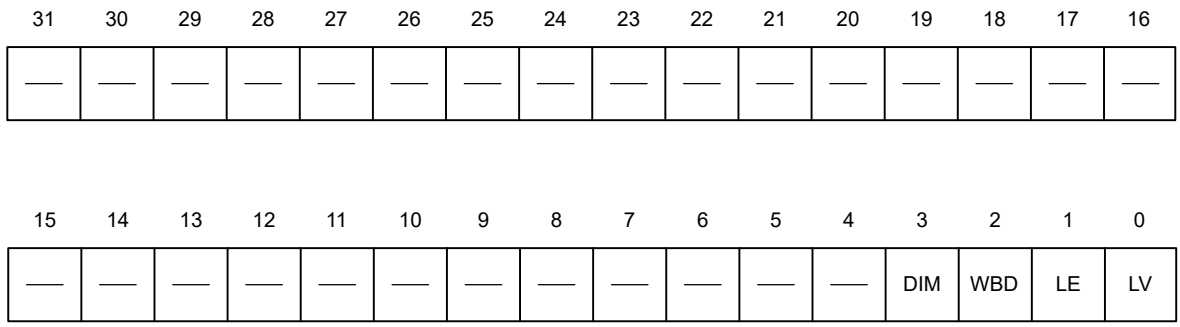
A descriptor should be deployed in the link address as shown in Table 15.15. DMAC interprets data obtained through descriptor read in order.

Table 15.15 Descriptor placement

Address (Link Address + N)*1							
+0x1C	+0x18	+0x14	+0x10	+0x0C	+0x08	+0x04	+0x00
Next link address	Extension	Interval	Config*2	Transaction byte	Destination address	Source address	Header

Note 1. Link address should be aligned to 32-bit boundary.
Note 2. Register mode setting is prohibited.

As shown in Figure 15.7, header indicates descriptor states. This area is read by DMAC before starting a DMA transfer in link mode. In addition, after the DMA transfer, the transfer status is written back by DMAC.



When reading header, DMA performs a write back for this 4 bytes area after DMA transfer and when the descriptor information is completed. Write back data is a header read data except LV, and LV = 0.

Figure 15.7 Header area

Table 15.16 Header area

Bit position	Bit name	Description
0	LV	Link Valid Indicates that this descriptor is enabled. When WBD = 0, DMAC writes 0 after the DMA transfer written in the descriptor. Set 1 when setting header. 0: The descriptor is disabled 1: The descriptor is enabled
1	LE	Link End Indicates that the link ends during DMA transfer of this descriptor. To indicate the end of the link, set this bit to 1. 0: The link continues 1: The link ends
2	WBD	Write Back Disable Masks write back execution of the LV bit. When this bit is 1, DMAC does not perform write-back operation. 0: The LV bit is written back to 0 1: The LV bit is not written back
3	DIM	Descriptor Interrupt Mask When LV = 0 at loading of header, specifies whether DMA transfer completion interrupt mask or not. 0: DMA transfer completion interrupt is asserted 1: DMA transfer completion interrupt is masked
31:4	—	A reserved area. Set 0.

Data in descriptors except header has the same specifications as an on-chip register. However, the DMS bit in the CHCFG_n register cannot be changed by a descriptor. For details on the on-chip register specifications, see section 15.3. Register Descriptions.

For descriptor setting examples, see section 15.6.4. Setting Example 4 (Link Mode).

Figure 15.8 provides an overview of the descriptor area and the DMA transfer area to which DMAC accesses.

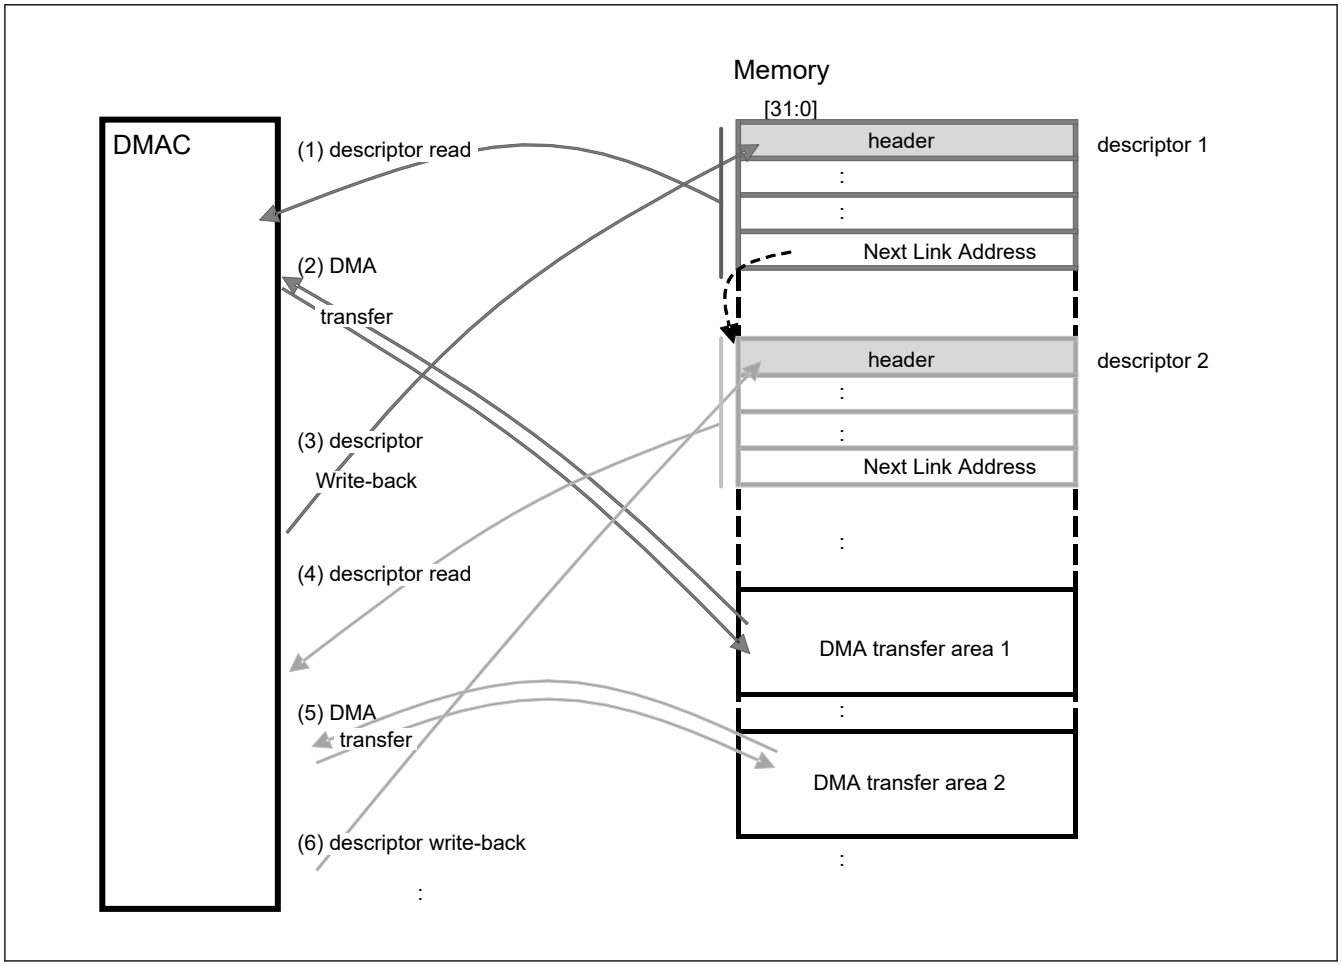


Figure 15.8 Header area

1. Descriptor read
   Loads the value set for the on-chip NXLA_n register to the CRLA_n register, and then reads the descriptor from the memory space (descriptor 1) indicated by the CRLA_n register.
2. DMA transfer
   When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.
3. Descriptor write-back
   After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 1 as data back to header [31:1] of descriptor 1 in bytes.
4. Descriptor read
   If the LE bit in header of the descriptor which was read previously (step 1) is 0, reads the next descriptor from the address (descriptor 2) indicated by the next link address in the descriptor.
5. DMA transfer
   When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.
6. Descriptor write-back
   After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 4 as data back to header [31:1] of descriptor 2 in bytes.

Hereafter, repeats steps (4) through (6).

When LE of header is 1 and WBD = 0, DMA transfer proceeds in accord with the descriptor settings, and 0 is written back to the LV bit of the header, after which operation ends.

When LE of header is 1 and WBD = 1, performs a DMA transfer with the setting, and ends the operation (no write-back is performed).

When LV of header is 0 the operation stops (no DMA transfer is performed).

(5) Link Configuration Examples

In link mode, descriptors can be configured as shown in Figure 15.9.

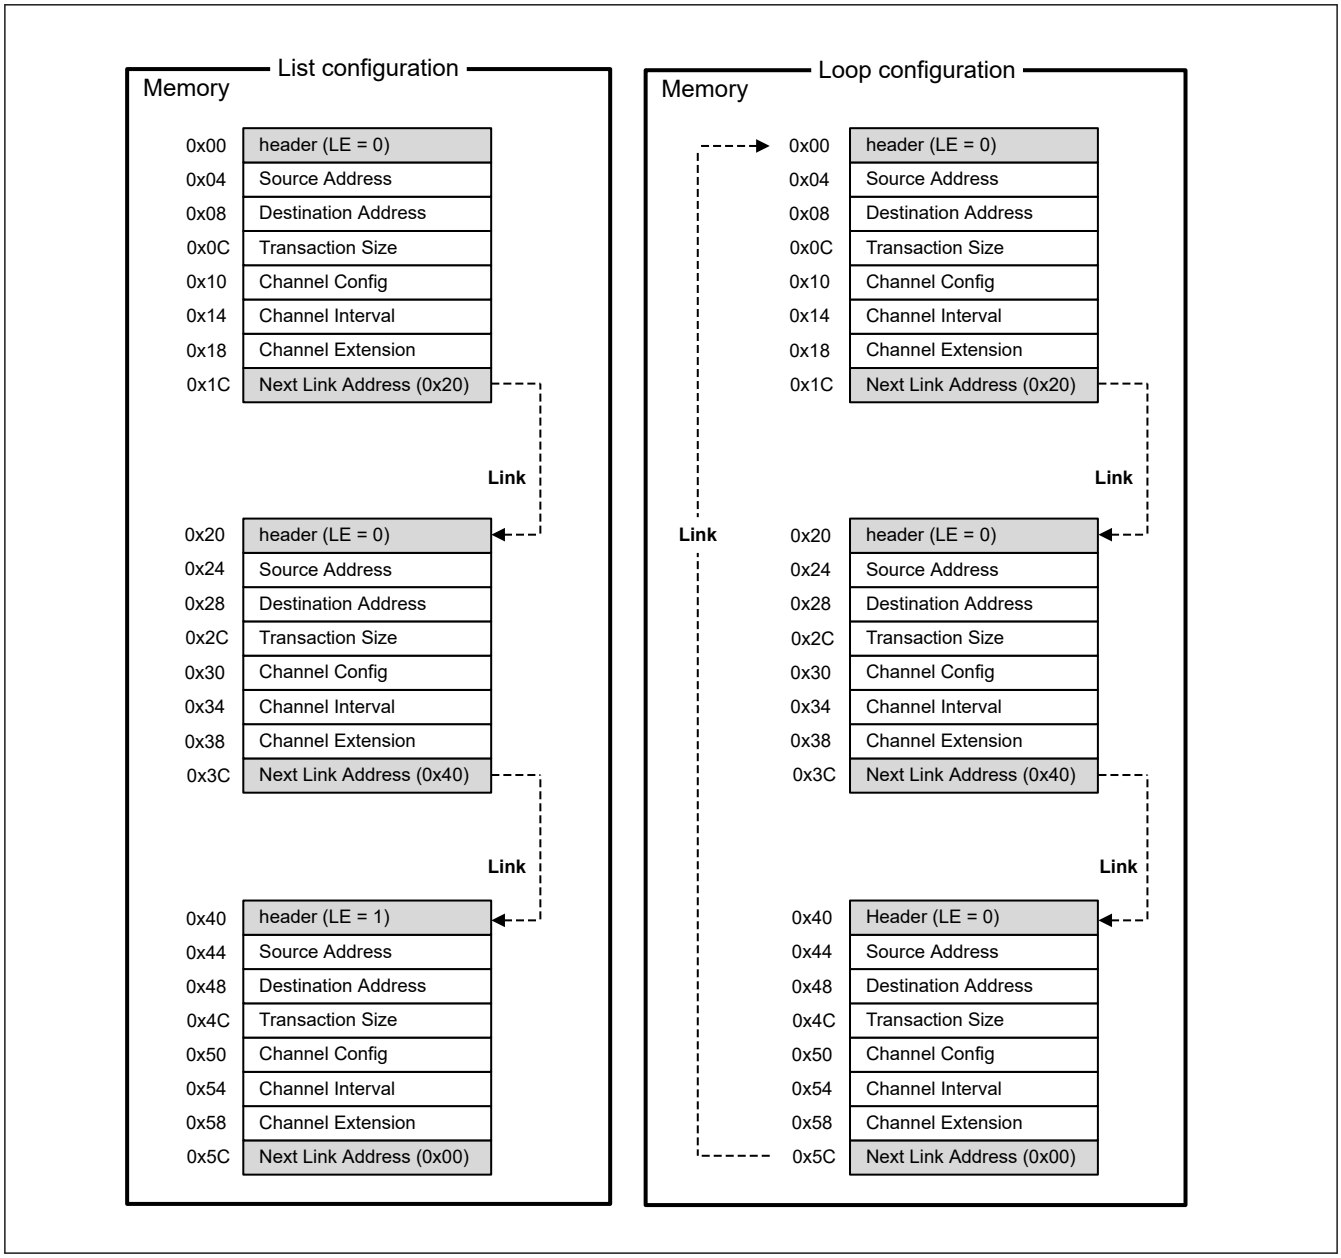

Figure 15.9 Header area

Setting 1 to the LE bit in header of the last descriptor ends the link.

Setting the link destination of the last descriptor to the address of the previous descriptor configures the descriptors in a loop. To end the loop, change the LE bit of header to 1 before DMAC reads a descriptor, or follow the procedure to pause a transfer.

15.4.2 Transfer Mode

Single transfer mode and block transfer mode are supported. When selecting mode, use the TM bit in the CHCFG_n register for each channel.

Table 15.17 Basic transfer settings

Transfer mode	TM (CHCFG_n)	Description
Single transfer	0	For one DMA request, performs a DMA transfer
Block transfer	1	For one DMA request, performs transfers until a DMA transfer completes

15.4.2.1 Single Transfer Mode

When a DMA transfer request is accepted, a DMA transfer is performed on the side (transfer source or transfer destination) indicated by the REQD bit in the CHCFG_n register to activate DACK. Each time a transfer request is accepted, transfer proceeds. This operation is repeated until it reaches the transfer size loaded from the N0TB_n or N1TB_n register to the CRTB_n register. Arbitration between channels is performed for each DMA transfer.

The DACK output timing differs depending on the setting for the REQD bit in the CHCFG_n register or settings for the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register) bit settings. For details, see section 15.4.8. Differences in Operation According to the Transfer Data Size.

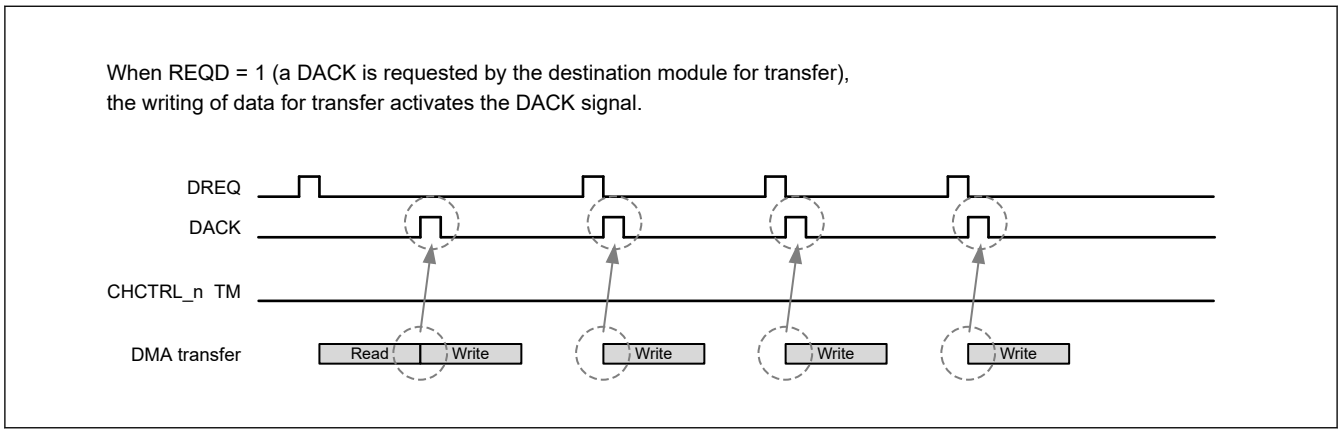

Figure 15.10 Single transfer mode (REQD = 1, SDS > DDS)

15.4.2.2 Block Transfer Mode

Once a DMA transfer request is accepted, the transfer continues until transfer of the number of bytes loaded from the N0TB_n or N1TB_n register to the DMA transfer byte register (CRTB_n register) is completed (After DMA transfer completion, arbitration between channels is performed for each DMA transfer).

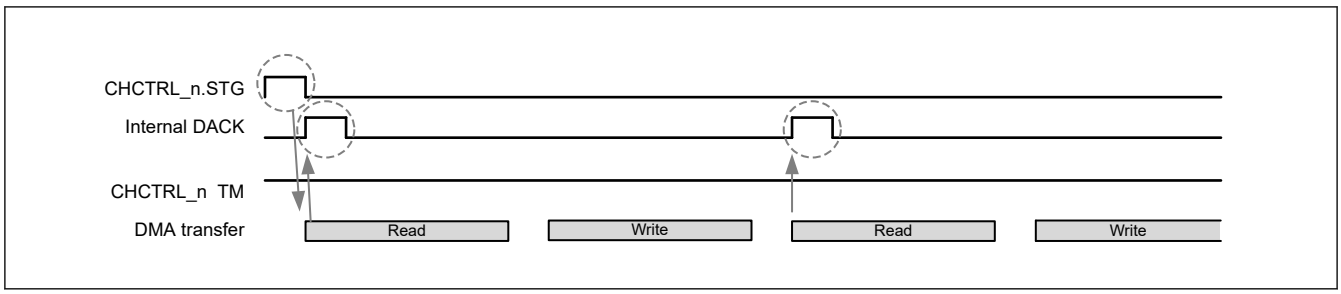

Figure 15.11 Block transfer mode (REQD = 0, SDS < DDS)

15.4.3 DMA Channel Priority Control

As an arbitration method between channels, fixed priority mode and round-robin mode are supported. To select the mode, use the PR bit in the DCTRL register. When the PR bit is 0, fixed priority mode is selected. When the PR bit is set to 1, round-robin mode is selected.

Table 15.18 Priority control settings

Transfer mode	PR (DCTRL)	Description	Applications
Fixed Priority	0	Channels 0 to 7, channels 8 to 15 are fixed priority mode. CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15)	Select this mode if channels have priority
Round-Robin	1	Controls requests in round-robin mode	Select this mode if you want to execute requests equally

15.4.3.1 Fixed Priority Mode

In fixed priority mode, the priority levels are fixed within the group of channels 0 to 7 and within the group of channels 8 to 15. In addition, the priority levels between the group of channels 0 to 7 and the group of channels 8 to 15 are in round-robin mode.

The priority levels immediately after a reset and transfer through DMA channel 0 are shown in Figure 15.12.

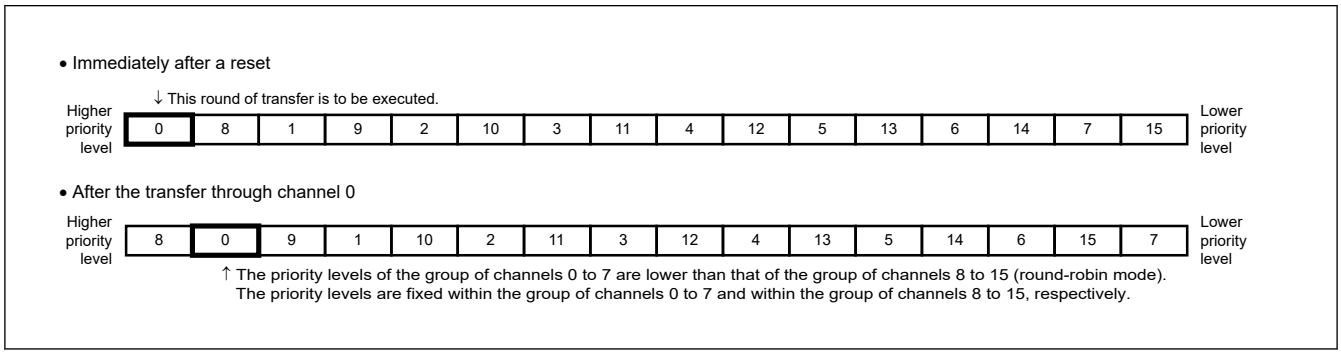

Figure 15.12 Priority levels immediately after a reset and transfer through DMA channel 0

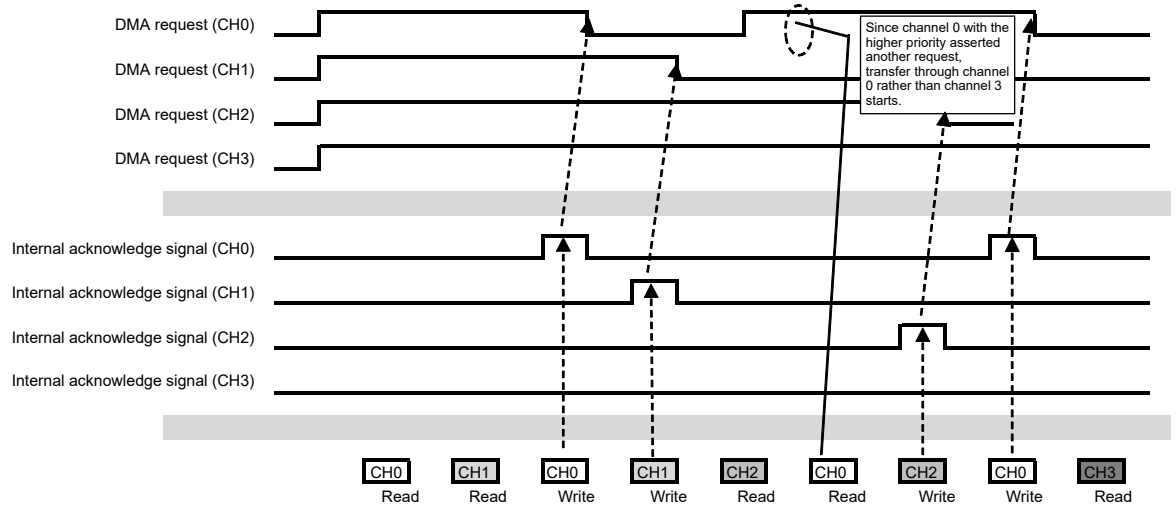
If DMA transfer requests are generated on multiple channels simultaneously, a DMA transfer request with a smaller channel number takes precedence.

Figure 15.13 provides an example of when a DMA transfer is performed in fixed priority mode if another DMA transfer with higher priority is requested.

Example: DMA requests are issued through four channels at the same time.



Note: Channel 0 is handled with the highest priority, but the transfer with the next highest priority is performed because bus arbitration is performed after data has been read from the transfer source of channel 0. Read operation of another channel may interrupt the operation between reading data from and writing data to the same channel.

Figure 15.13 Fixed priority mode (number of channels = 4 and REQD = 1)

15.4.3.2 Round-Robin Mode

In round-robin mode, priority is changed every time a transfer of a channel is accepted so that the lowest priority is given to the channel in which the last transfer is performed.

The priority levels immediately after a reset and transfer through DMA channel 2 are shown in Figure 15.14.

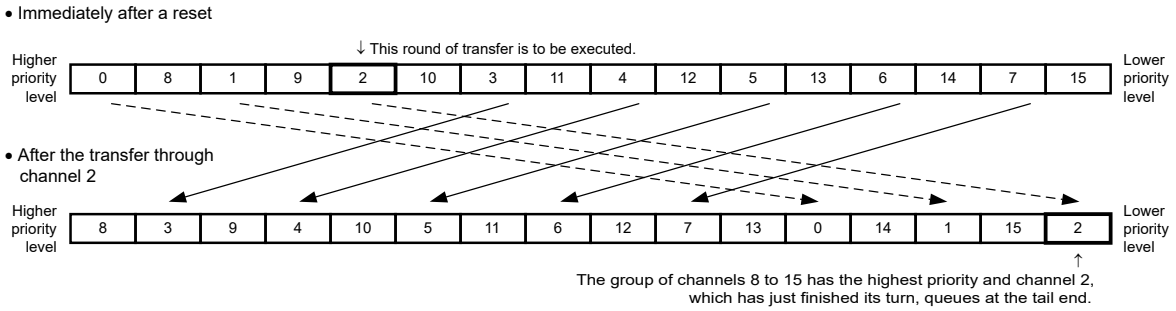


Figure 15.14 Priority levels immediately after a reset and transfer through DMA channel 2

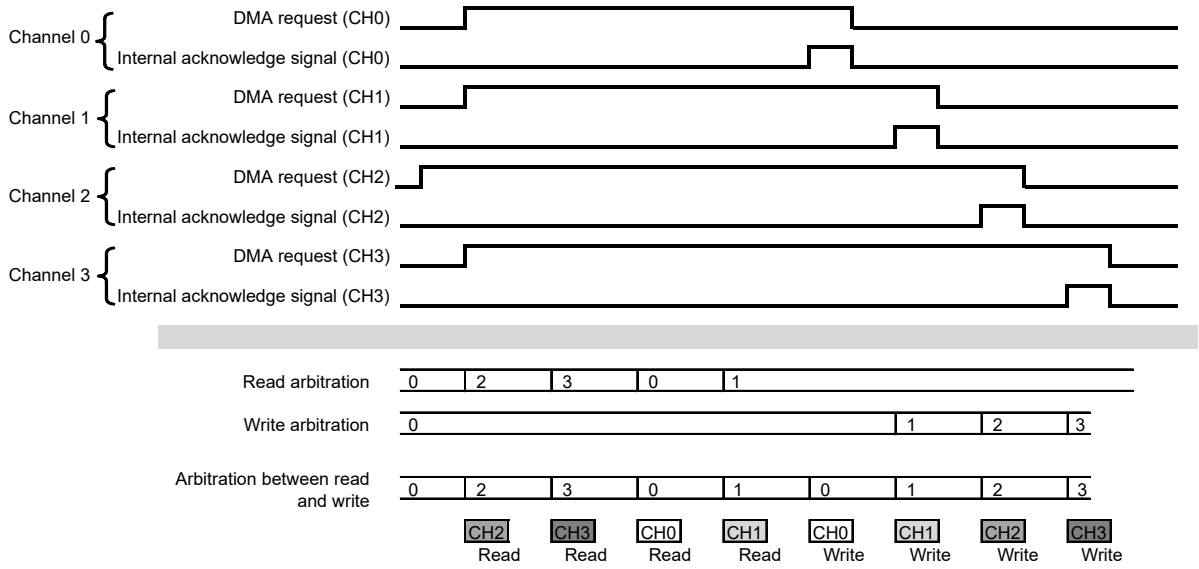
Figure 15.15 provides an example of a DMA transfer in round-robin mode.



Note: Within DMAC, arbitration between read channels and arbitration between write channels are performed. As a result of those arbitrations, further arbitration is performed, and a bus access is issued.

Figure 15.15 Round-robin mode (number of channels = 4 and REQD = 1)

15.4.4 DMA Transfer Request

DMA activation requests have four types including software requests, external requests, on-chip peripheral module requests, and external interrupts.

Select the transfer request source for an external request, on-chip peripheral module request, external interrupt, and software request with the DMACm_RSSELn register (m = 0, 1, or 2, n = 0 to 5).

For details on the DMACm_RSSELn register (m = 0, 1, or 2, n = 0 to 5), see section 15.3.9. DMAC0_RSSELi : DMAC Unit 0 Resource Select Register i (i = 0 to 5) and section 15.3.10. DMAC1_RSSELi : DMAC Unit 1 Resource Select Register i (i = 0 to 5).

15.4.4.1 Specifying Detection Operation of DMA Transfer Requests for Each Source

Detection methods for DMA transfer requests of external requests, on-chip peripheral module requests, external interrupts, and software requests might be specified according to sources.

For each DMA transfer source, set the LVL, LEN, and HEN bits in the CHCFG_n register according to Table 15.19, Table 15.20, and Table 15.21.

For details on edge detection operation, see Figure 15.16 and Figure 15.17. For information about level detection operation, see Figure 15.18 and Figure Figure 15.19.

Table 15.19 Detection operation specification for each source of DMA transfer requests

DMA transfer request source	Detection operation specification of DMA transfer requests	DMA acknowledge signal specification
External request	Detects the rising edge. Detects the falling edge. Detects the high level. Detects the low level.	Depends on specifications of the DMA transfer request source
On-chip peripheral module request	Depends on specifications of the DMA transfer request source. See Table 15.21.	Bus cycle mode
External interrupt	Detects the rising edge. Detects the high level.	Bus cycle mode
Software request	Detects the rising edge	Bus cycle mode

Table 15.20 Method of detecting DMA transfer request signals

Mode	LVL (CHCFG_n)	HIEN (CHCFG_n)	LOEN (CHCFG_n)	Description
Edge detection	0	0	0	Disables detection
			1	Detects the falling edge
		1	0	Detects the rising edge
			1	Detects the falling and rising edges
Level detection	1	0	0	Disables detection
			1	Detects the low level
		1	0	Detects the high level
			1	DMA transfer starts regardless of the request signal level when the SETEN bit in the CHCTRL_n is 1. In this setting, DMA acknowledge must be set to other than level mode. If level mode is set, dead lock will occur.

Table 15.21 DMA transfer request detection operation setting table (1 of 2)

DMA transfer request source	DMA transfer source	Transfer source	Transfer destination	REQ_SELn[8:0]	CHCFG_n						
					TM	AM[2:0]*2	LVL	HIEN	LOEN	REQD*2	SEL[2:0]

Note 1. Set the LVL, HIEN, and LOEN bits of the external interrupts (IRQ0 to IRQ13) as follows:

For the setting of the NS_PORTNF_MD register, see section 12.3.2.4. NS_PORTNF_MD : Interrupt Edge Detection Setting Register.

LVL: Set according to the edge/level setting of the NS_PORTNF_MD register.

HIEN: Set to 1 regardless of the detection level of the NS_PORTNF_MD register.

LOEN: Set to 0 regardless of the detection level of the NS_PORTNF_MD register.

Note 2. If the DACK/TEND signal is not used, specify any setting.

Note 3. When an interrupt occurred at the same time as DMA transfer request, DMA transfer completion interrupt does not occur. DMA transfer completion should be confirmed by END bit in CHSTAT_n register.

Note 4. Available trigger source number (event number) is defined in event table. For details, see section xx.xx.xx Event Table.

Note 5. Set the value corresponding to channel as follow:

ch 0 or 8: 0x0

ch 1 or 9: 0x1

ch 2 or 10: 0x2

ch 3 or 11: 0x3

ch 4 or 12: 0x4

ch 5 or 13: 0x5

ch 6 or 14: 0x6

ch 7 or 15: 0x7

Remarks: CHCFG_n register setting values

TM bit	0:	Single transfer
	1:	Block transfer
AM[2:0] bits	001b:	DACK level output
	010b:	DACK bus cycle output
	100b:	Masks DACK output
LVL bit	0:	Detects the edge of a DMA request
	1:	Detects the level of a DMA request
REQD bit	0:	DACK output during read operation
	1:	DACK output during write operation

Note: Instead of an interrupt source from peripheral modules, transfer completion sources of DMAC channels selected by the DMAC source select register are connected to the vector number selected by the DMAC Source Select Register.

15.4.4.2 Edge Detection

Setting the LVL bit in the CHCFG_n register to 0 detects the edge.

Setting the HIEN bit in the CHCFG_n register to 1 detects the rising edge, and setting the LOEN bit in the CHCFG_n register to 1 detects the falling edge.

For DMA requests by the DREQ signal, request the next DMA transfer after the DACK signal is activated.

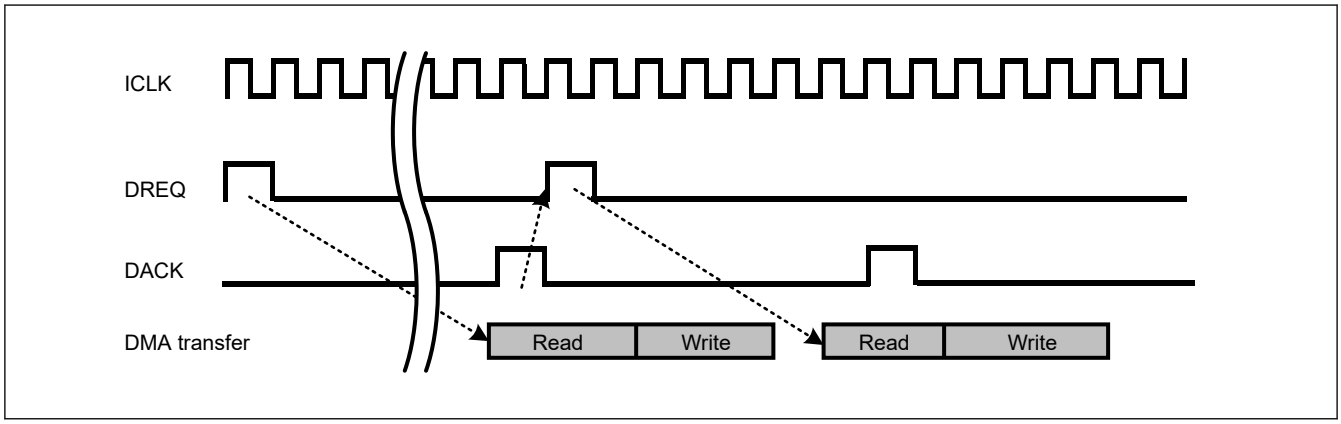

Figure 15.16 Edge detection timing (rising edge (HIEN = 1), DACK output is active during reading (REQD = 0))

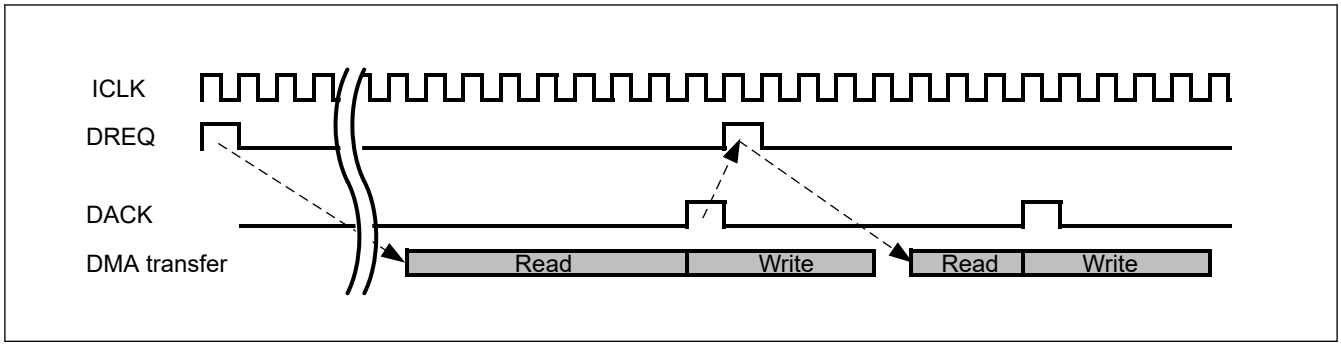

Figure 15.17 Edge detection timing (rising edge (HIEN = 1), DACK output is active during writing (REQD = 1))

15.4.4.3 Level Detection

Setting the LVL bit in the CHCFG_n register to 1 detects the level.

If a DMA transfer request is active (according to HIEN or LOEN settings) for two consecutive clocks (CLK) or more, it is recognized as a DMA request.

If the DACK signal output is set to level mode, the DACK signal output remains at the active level until the DMA transfer request is deactivated.

If you want to request the next DMA transfer, request it after the DACK signal is deactivated.

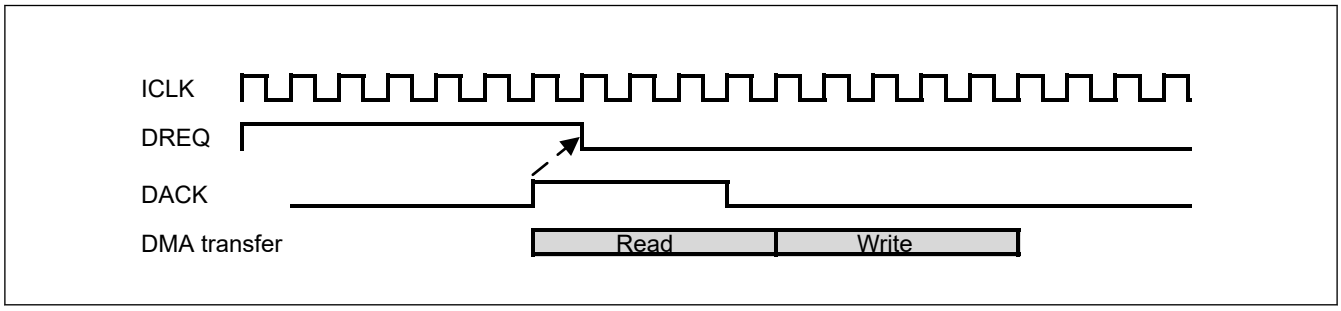

Figure 15.18 Level detection timing (high-level detection (HIEN = 1), DACK output is active during reading (REQD = 0))

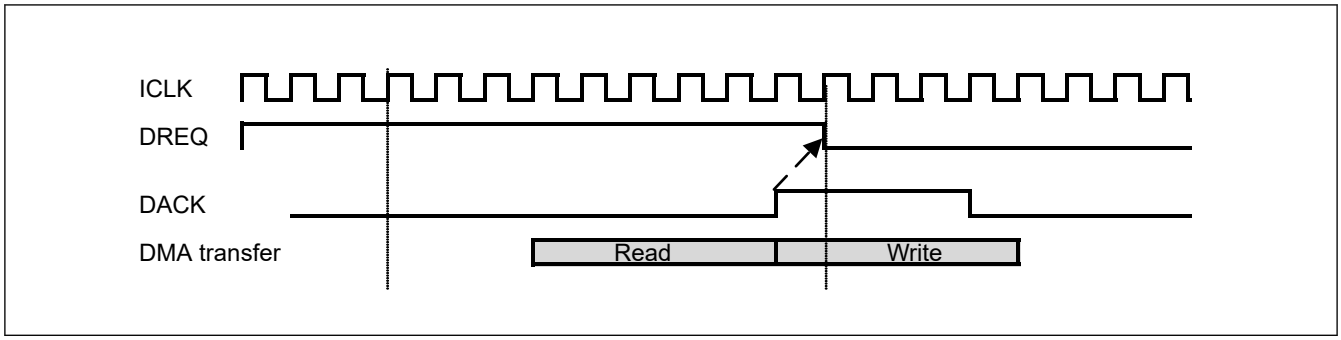

Figure 15.19 Level detection timing (high-level detection (HIEN = 1), DACK output is active during writing (REQD = 1))

15.4.5 DMA Acknowledge Output/DMA Transaction Completion Output Function

The DMA acknowledge signal (DACK) is output as a reception response signal for a DMA transfer request.

The DMA transfer completion signal (TEND) is output when the DACK signal for the last DMA transfer is output.

If the DREQ signal is used for a DMA transfer request, use DACK as the DMA acknowledge signal, and use TEND as the DMA transaction completion output signal.

Set the output mode of the DACK signals with the AM[2:0] bits in the Channel Configuration register (CHCFG_n). Level output and bus cycle output are supported.

The outputs of the DACK and TEND signals on the DACK and TEND pins are active only when the conditions given below are met. To use the DACK and TEND pins, specify appropriate settings for the Port Function Control register (PFC) and the Port Mode Control register (PMC) to use those pins as peripheral functions. For details on pin settings, see section 17, I/O Ports.

The conditions:

- The DREQ pin is set as the source for the DMA transfer request
- The source and destination of the DMA transfer are set as follows:
  - DMA is set to be transferred from an external address space (CSn) to any destination while the CHCFG_n.REQD bit is set to 0 (requested from the source of transfer)
  - DMA is set to be transferred to an external address space (CSn) from any source while the CHCFG_n.REQD bit is set to 1 (requested from the destination of transfer)

The outputs on the pins are not active for the cases other than above. However, the internal signals become active according to the setting of the AM[2:0] bits.

Transfer requested from	Source for DMA transfer	Transferred from	Transferred to	CHCFG_n		External pins used for outputting an active signal	
				AM[2:0]	REQD	DACK Signal	TEND Signal
Request from outside	DREQ	External bus	Anywhere	001/010	0	DACK	TEND
		Anywhere	External bus		1	DACK	TEND
		Internal	Anywhere		0	—	—
		Anywhere	Internal bus		1	—	—
Other than above	Other than above	Anywhere	Anywhere	Any value	Any value	—	—

Note: —: The outputs on the pin are always inactive. Inactive signal level is obtained by inverting the active level set by the bits which specify the acknowledge levels and transfer-end levels.
External bus refers to the CS0 to CS5 spaces and internal bus refers to the address spaces other than the external bus.

15.4.5.1 DMA Acknowledge Signal Output

For the DMA acknowledge signal and DMA transaction completion signal, output mode might be specified according to the source.

For each DMA transfer request source, specify the correct operation with the AM[2:0] bits of the Channel Configuration register (CHCFGn) according to Table 15.19, Table 15.21, and Table 15.22.

For details on level output operation, see Figure 15.20 and Figure 15.21.

For details on bus cycle output operation, see Figure 15.22 and Figure 15.23.

Table 15.22 DACK/TEND pin output settings (1 of 2)

Mode	AM[2] (CHCFG_n)	AM[1:0] (CHCFG_n)	REQD (CHCFG_n)	Applications
Level	0	01b	0 (activated during read operation)	In level mode, enable DACK. The DACK output remains active until the DMA transfer request is deactivated. The TEND signal is activated only when the last DMA transfer is performed.
			1 (activated during write operation)	
Bus cycle	0	10b or 11b	0 (activated during read operation)	The DACK signal remains active during a bus cycle. Use this mode if you want to activate the DACK signal until a bus cycle ends.
			1 (activated during write operation)	

Table 15.22 DACK/TEND pin output settings (2 of 2)

Mode	AM[2] (CHCFG_n)	AM[1:0] (CHCFG_n)	REQD (CHCFG_n)	Applications
Mask	1	Any value	Any value	Set DACK output to inactive (fixed). Use this mode if you do not want to notify the connection destination of DACK output.

15.4.5.2 Level Output

By setting the AM field in the CHCFG_n register to 001b, the mode is switched to level output. DACK output remains active until the DMA transfer request is deactivated.

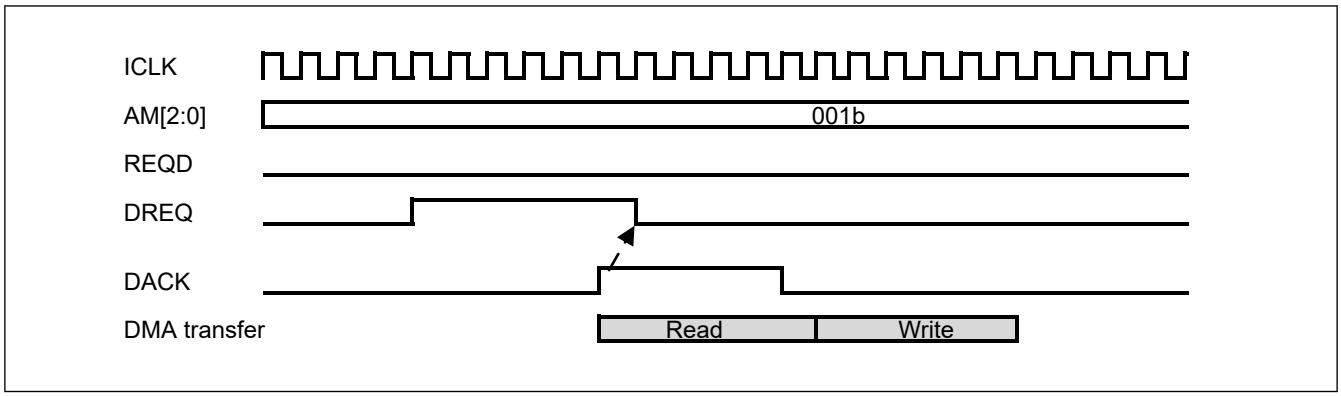

Figure 15.20 DACK output timing (AM[2:0] = 001b, REQD = 0)

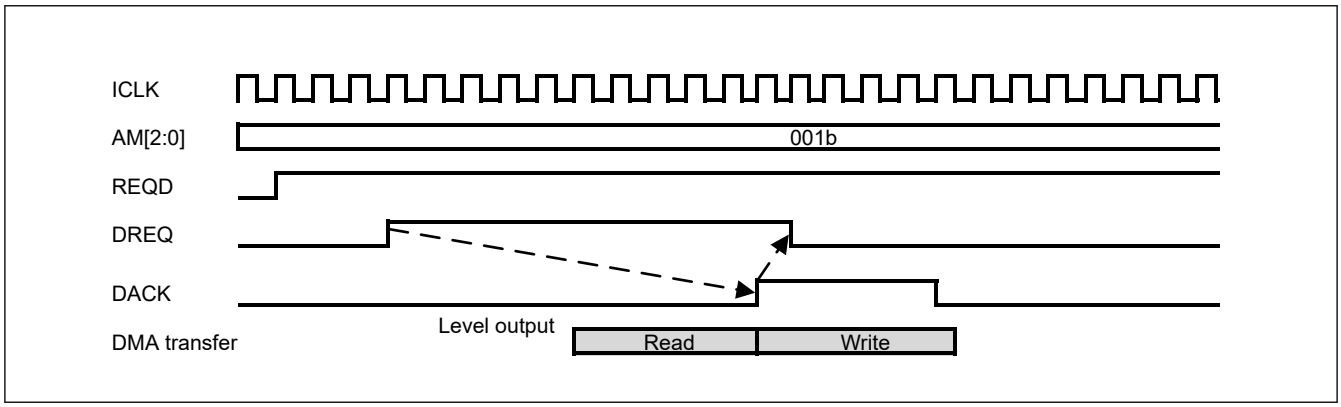

Figure 15.21 DACK output timing (AM[2:0] = 001b, REQD = 1)

15.4.5.3 Bus Cycle Output

By setting the AM field in the CHCFG_n register to 010b, the mode switches to bus cycle output. During a bus cycle, the DACK output remains active.

While the DACK signal is active, the DREQ signal is masked in the CPU. Therefore, even if the DREQ signal is set to level detection, it is not necessary to deactivate the signal on the output side.

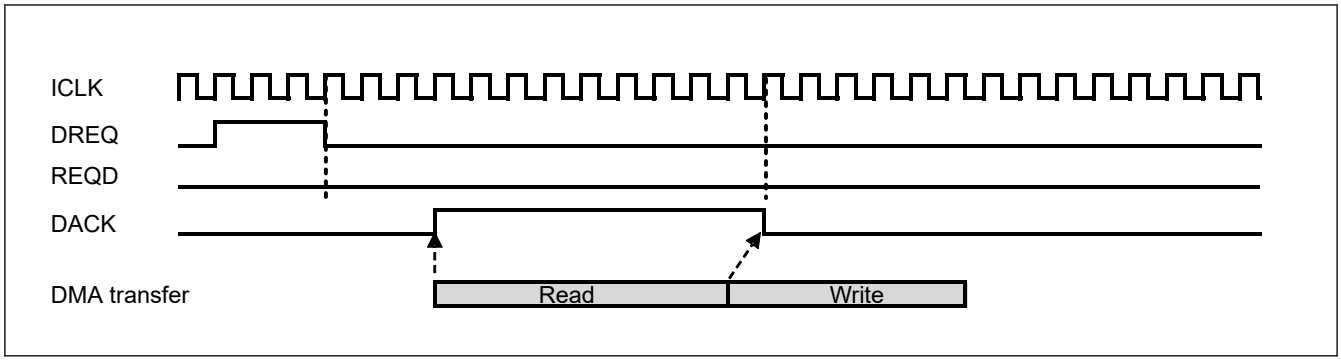

Figure 15.22 Bus cycle output timing (REQD = 0)

- When the REQD bit in the CHCFG_n register = 0 (activated during read operation), the DACK output remains active for the period from when a read request is output on the bus until a cycle elapses after reading the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.

The following signals trigger the rising and falling of the DACK output:

Rising: Starts a transfer.

Falling: Ends a transfer.

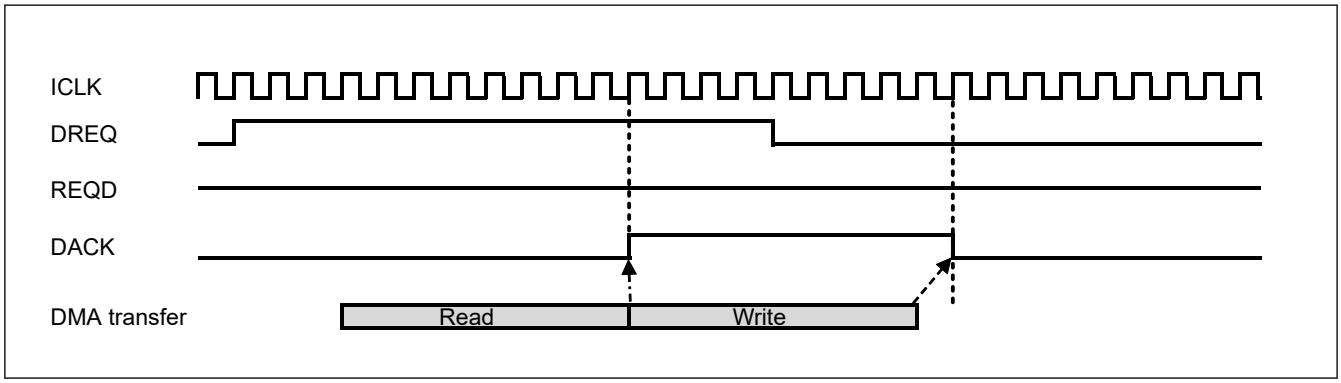

Figure 15.23 Bus cycle output timing (REQD = 1)

- When the REQD bit in the CHCFG_n register = 1 (activated during write operation), the DACK signal remains active for the period from when a write request is output until a clock (ICLK) elapses after responding to the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.

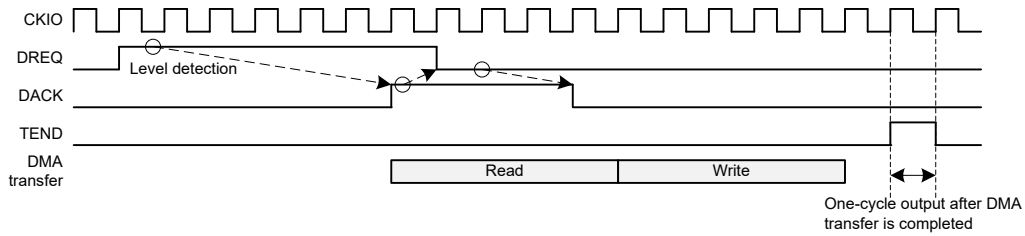
The following signals trigger the rising and falling of the DACK output:

Rising: Starts a transfer.

Falling: Ends a transfer.

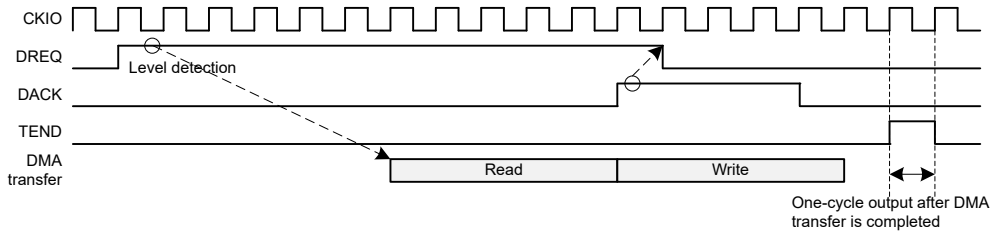
15.4.6 DMA Transaction Completion Signal Output

Figure 15.24 and Figure 15.25 show external DMA interface operation examples. One cycle of the TEND signal is output after the DMA transfer is completed.



Note:
- DMA transfer request: High level detection, request from transfer source (CHCFG_n.REQD = 0)
- DMA acknowledge output: Level mode (CHCFG_n.AM[2:0] = 001b)
- When source and destination are specified to external bus, the TEND signal might be output before write cycle completion.

Figure 15.24 External DMA interface operation example (REQD = 0: read)



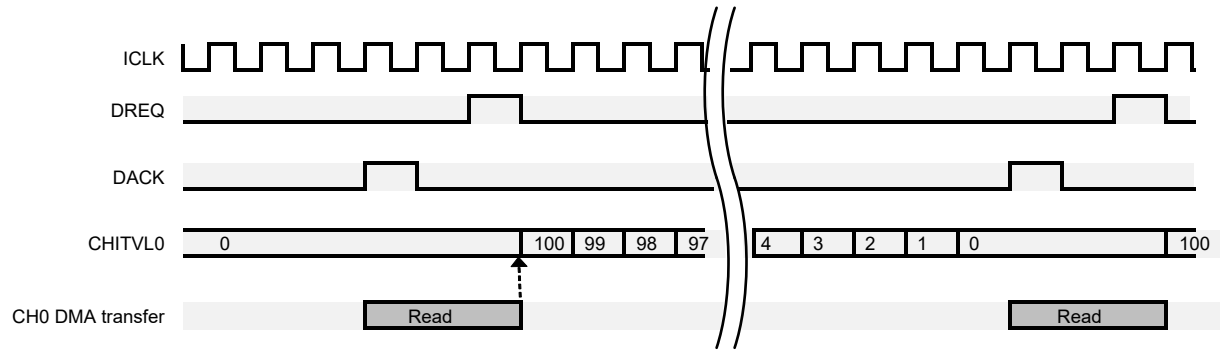
Note:
- DMA transfer request: High level detection, request from transfer source (CHCFG_n.REQD = 1)
- DMA acknowledge output: Level mode (CHCFG_n.AM[2:0] = 001b)

Figure 15.25 External DMA interface operation example (REQD = 1: write)

15.4.7 Interval Count Function

By the setting for the ITVL field in the CHITVL_n register, the execution interval of DMA transfers can be adjusted. This function is used to avoid occupation of a bus by DMAC. Until the count value becomes 0, no DMA transfer for the next DMA request is performed.

Figure 15.26 provides an operation example.



Note: In this example, when REQD = 0 (a transfer request issued by the source module) and SDS < DDS (data size at the destination is greater than that at the source), a preset number of intervals (100) are inserted between several rounds of read access after a transfer request.

Figure 15.26 Interval count (REQD = 0, SDS < DDS)

An interval is inserted after a transfer specified by the REQD bit in the CHCFG_n register. Figure 15.27 shows the relationship between the setting values for the REQD, SDS, and DDS bits in the CHCFG_n register and the cycles to which intervals are applied.

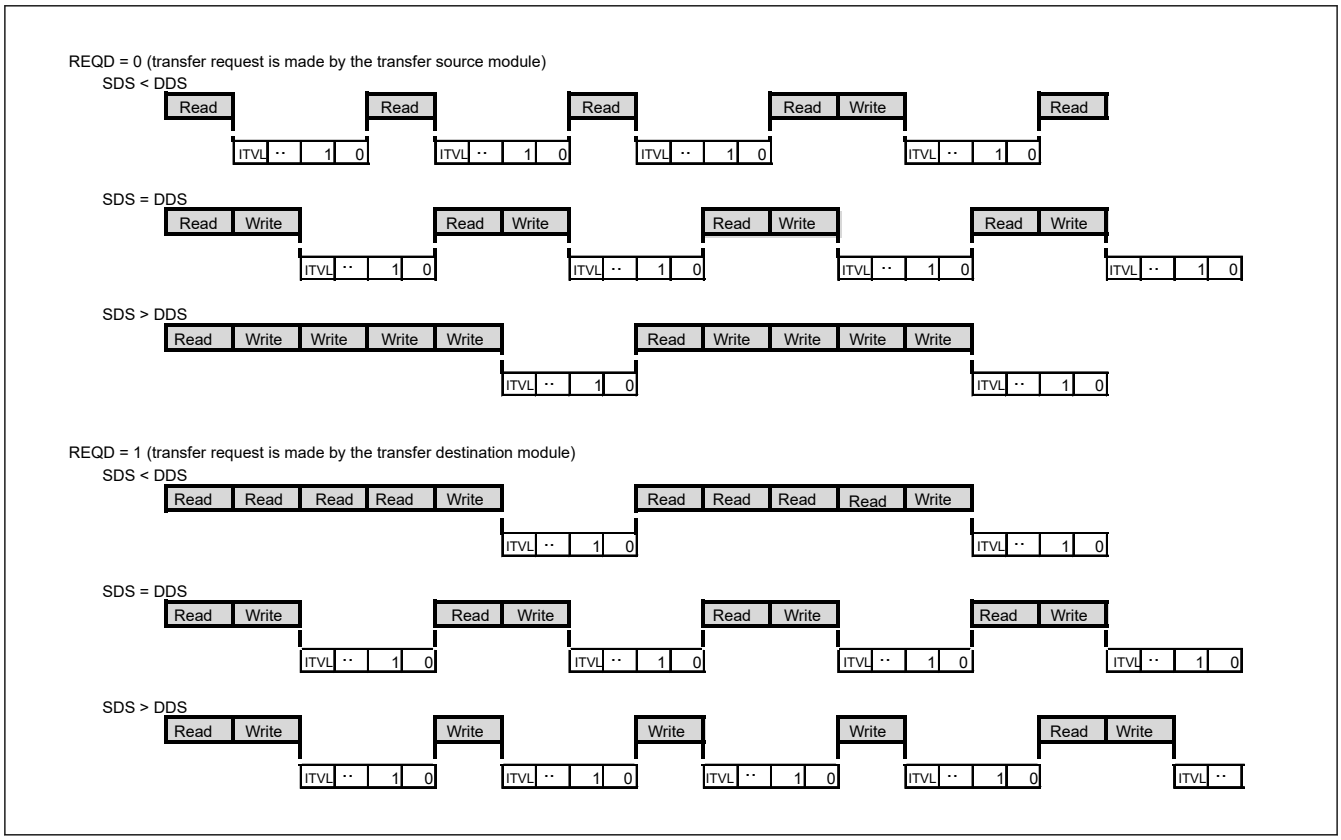


Figure 15.27 DMA transfer settings and interval counts

15.4.8 Differences in Operation According to the Transfer Data Size

15.4.8.1 When the Transfer Data Size on the Transfer Source is Small

When the transfer data size at the destination is large, reading from the source proceeds several times, and this is followed by writing to the destination.

Figure 15.28 shows the timing diagram when the transfer source is 8 bits, and the transfer destination is 32 bits (SDS = 0 and DDS = 2 in the CHCFG_n register) for rising edge detection.

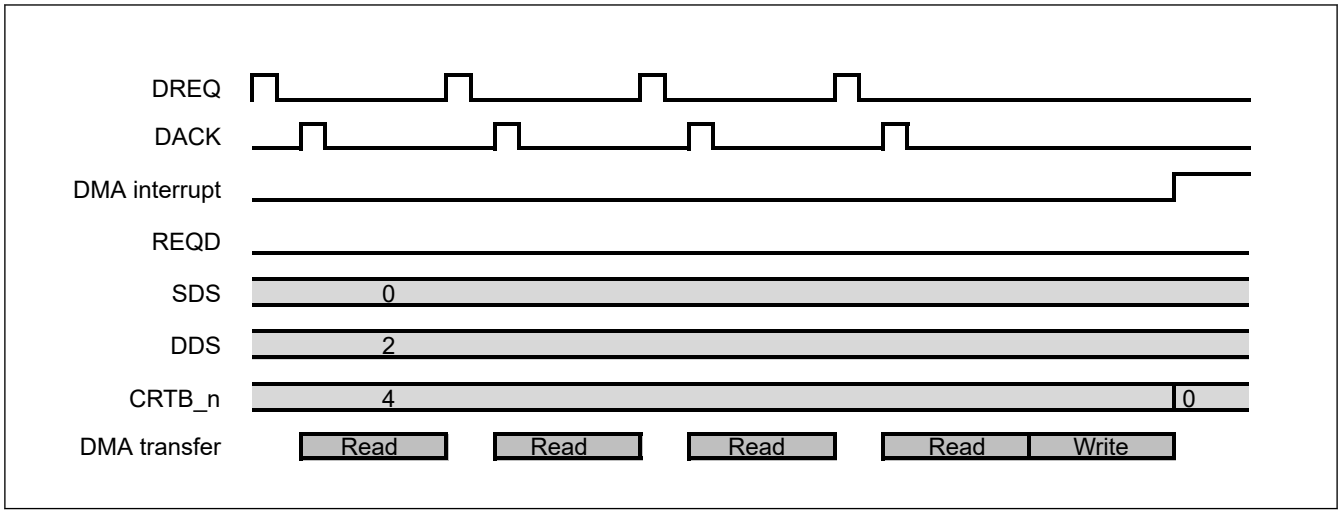

Figure 15.28 When the size of data on the transfer source is small (LVL in CHCFGn = 0, HIEN = 1, REQD = 0, SDS < DDS)

15.4.8.2 When the Transfer Data Size on the Transfer Destination is Small

When the transfer data size on the transfer source is large, after a single read operation, write operation to the transfer destination is performed a few times. Figure 15.29 shows the timing diagram when the transfer source is 64 bits, and the transfer destination is 16 bits (SDS = 3 and DDS = 1 in the CHCFG_n register) for rising edge detection.

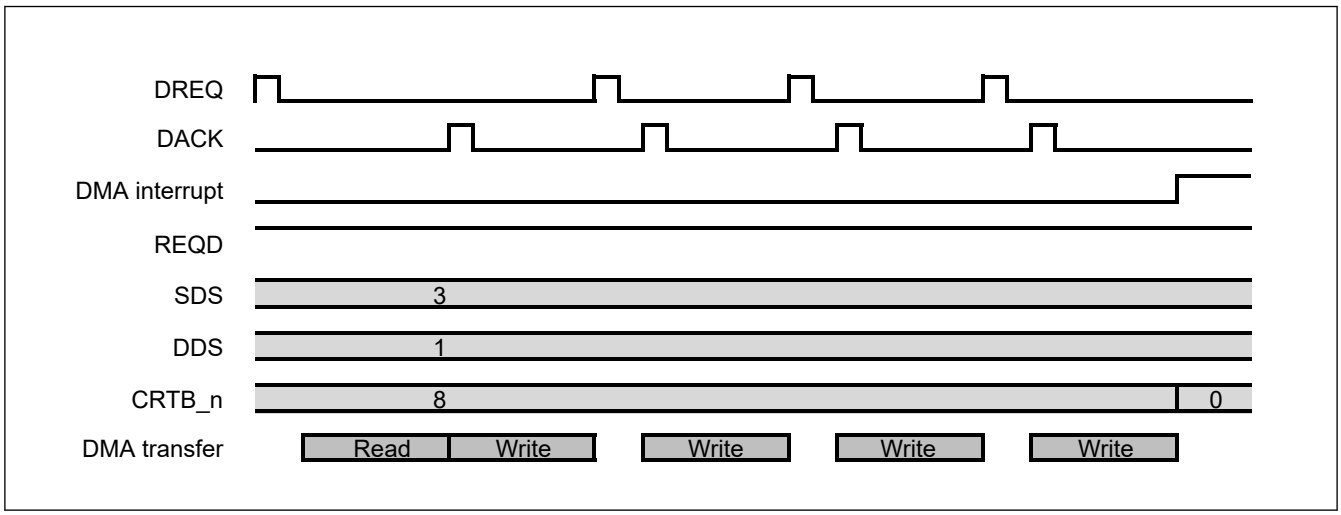

Figure 15.29 When the size of data on the transfer destination is small (LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in CHCFG_n)

15.4.8.3 When the Size of Transfer Data on the Transfer Source and on the Transfer Destination is the Same

Every time a DMA transfer request is detected, read operation is performed on the transfer source, and write operation is performed on the transfer destination.

Figure 15.30 shows the timing diagram when the transfer source and the transfer destination are 8 bits (SDS = 0 and DDS = 0 in the CHCFG_n register) for rising edge detection.

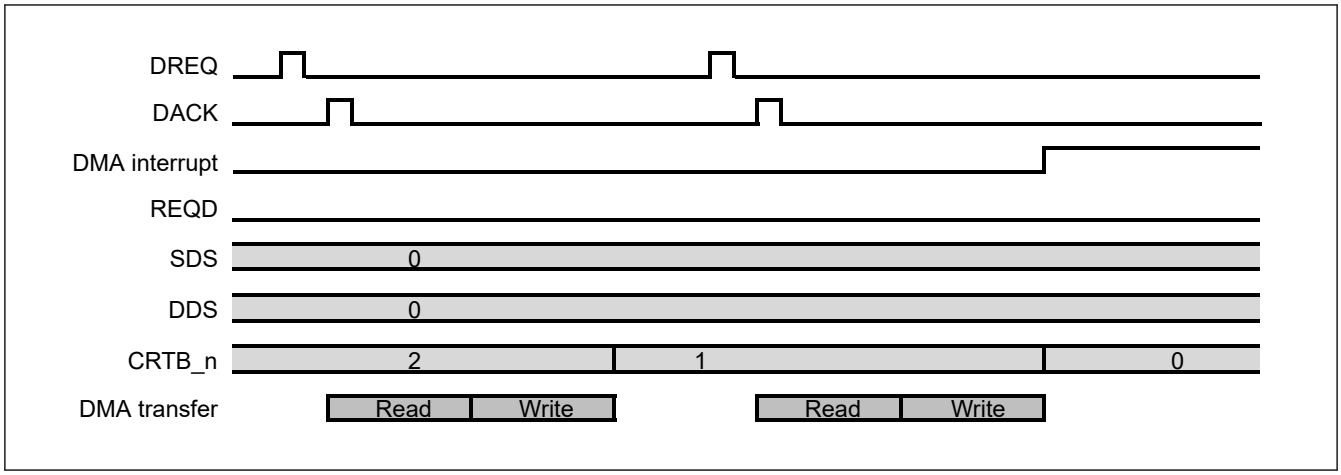

Figure 15.30 When the sizes of data on the transfer source and the transfer destination are the same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in CHCFG_n)

15.4.9 DMA Transfer Status

The CHSTAT_n register indicates the DMA transfer status of each channel.

The TACT bit in the CHSTAT_n register indicates that DMA operation is being performed on channel n. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1. The TACT bit remains 1 while accessing a descriptor, or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details on clear conditions, see section 15.3.7. CHSTAT_n : Channel Status Register n (n = 0 to 15)), and DMA transfers for the set number of times are finished.

The TACT bit is not cleared even when a DMA transfer finishes, but the EN bit is not cleared (when the REN bit in the CHCFG_n register = 1 in register mode or the next descriptor access is performed in link mode).

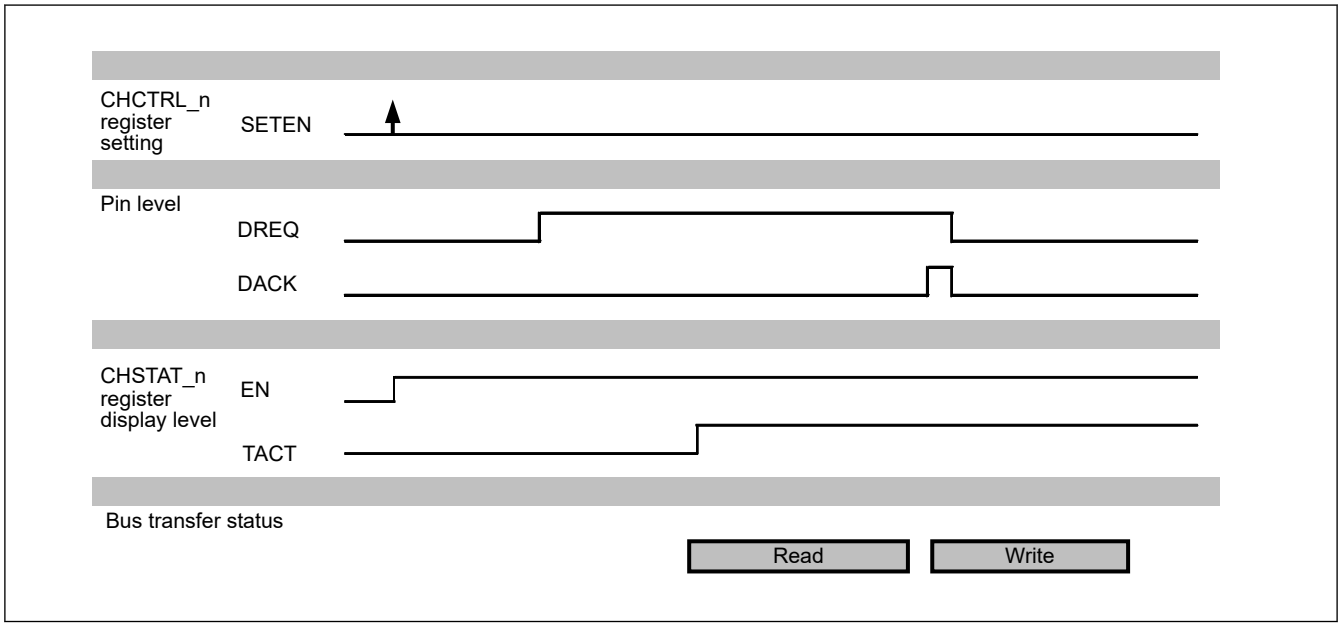

Figure 15.31 DMAC status example 1 (hardware request)

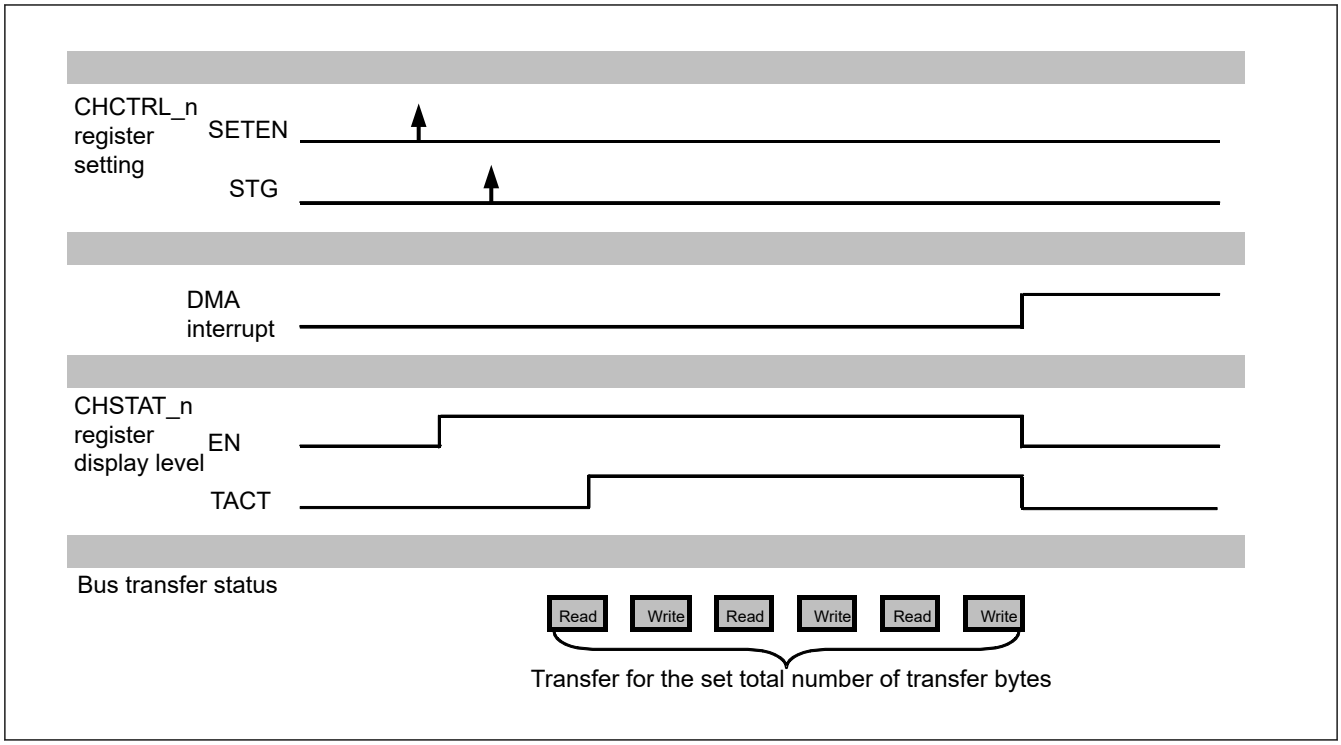

Figure 15.32 DMAC status example 2 (software request)

15.4.10 Suspending a Transfer

You can suspend a DMA transfer at the SETSUS bit in the CHCTRL_n register. At that time, if there is an already running bus cycle, waits for the cycle to end, then suspends the transfer. Writing 1 to the CLRSUS bit in the CHCTRL_n register resumes from the suspended state.

To check if the transfer is suspended, set the SETSUS bit in the CHCTRL_n register, and then make sure that the SUS bit in the CHSTAT_n register or the SUS bit in the DSTAT_SUS register on the applicable channel is set to 1.

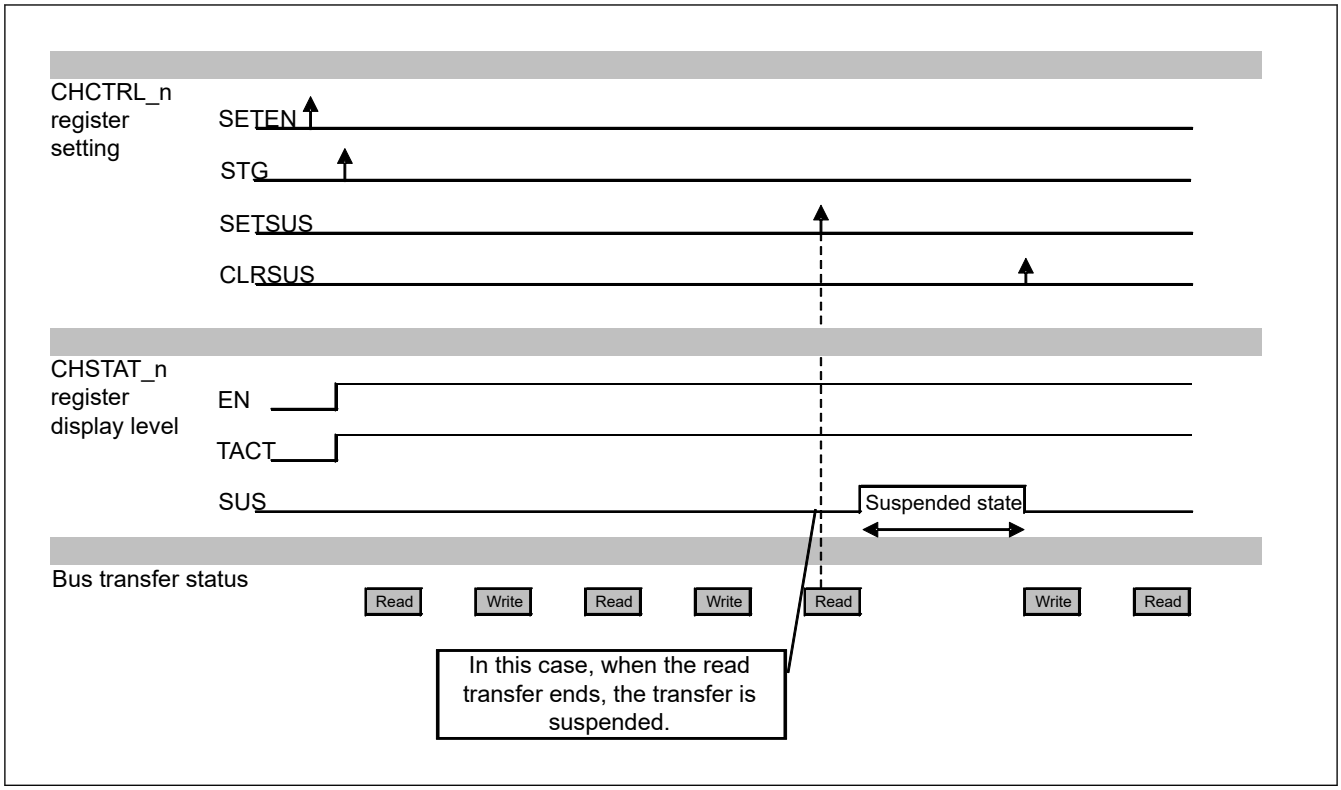

Figure 15.33 DMAC suspended state (software request block transfer)

15.4.11 Aborting a Transfer

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer of the channel. As processing after aborting the transfer, you can use the SBE bit in the CHCFG_n register to determine whether to flush data remaining in a buffer when a transfer is suspended. By default, SBE = 0 (do not flush data) is selected.

When this mode (flush data) is activated, if a transfer that is being performed when the CLREN bit in the CHCTRL_n register = 1 is aborted, data remaining in the buffer of DMAC is flushed, and the operation stops.

15.4.11.1 Aborting a Transfer (No Buffer Flush: SBE = 0)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort and then stop the DMA transfer. The timing to stop the transfer depends on the value set for the REQD bit. After the transfer stops, write 1 to the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

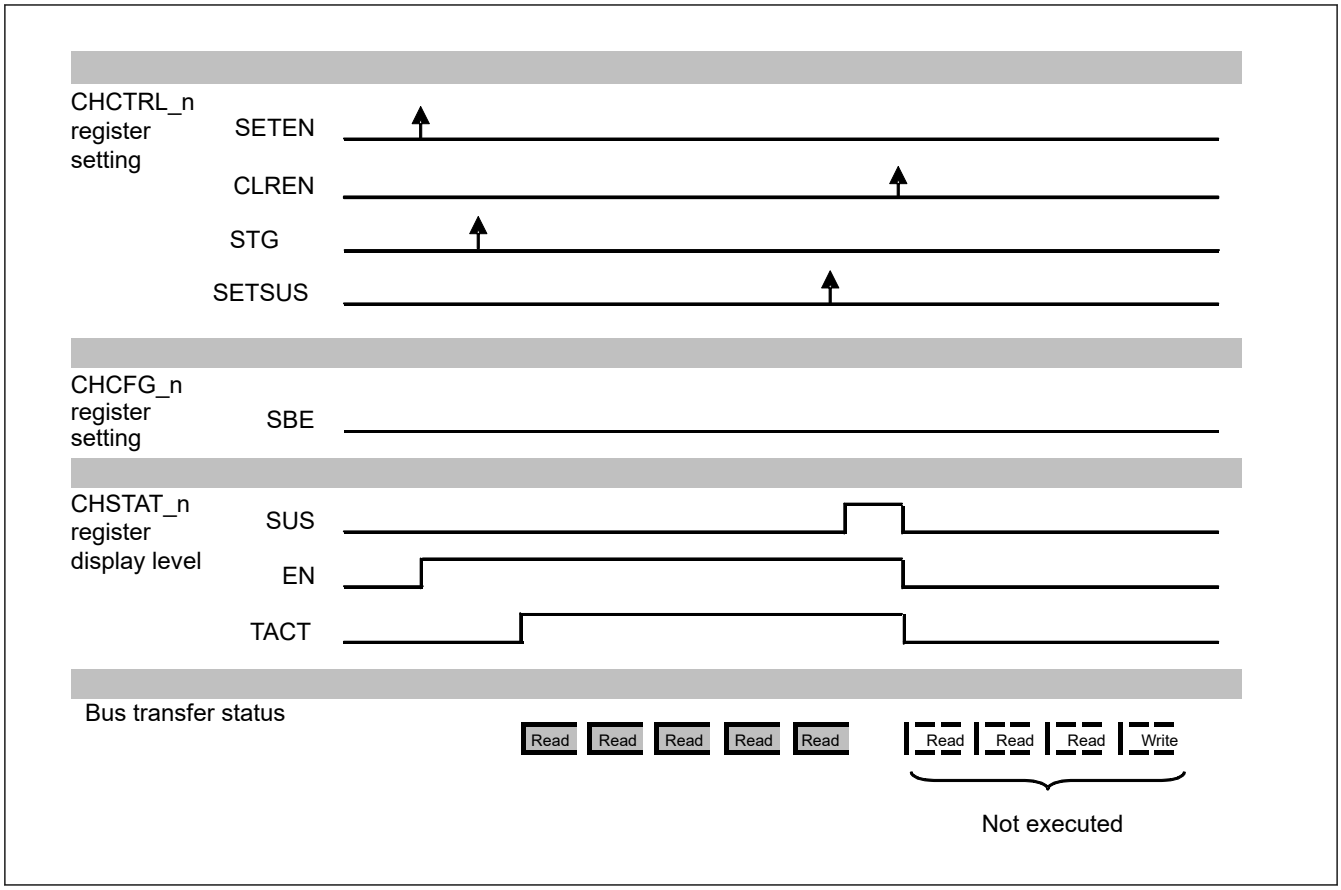

Figure 15.34 Aborting a DMA transfer

- When the TACT bit in the CHSTAT_n register is cleared, you can confirm that the channel stops completely.
- If a DMA transfer is aborted, no DMA transfer completion interrupt is generated.
- When the REQD bit in the CHCFG_n register = 0, the transfer stops when the next read operation completes. If there is data that can be written in the buffer, the transfer stops after the data is written.
- When the REQD bit in the CHCFG_n register = 1, the transfer stops when the next write operation completes.

15.4.11.2 Aborting a Transfer (Buffer Flush: SBE = 1)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer.

When the REQD bit in the CHCFG_n register = 0, already read data is flushed (written), and then the DMA transfer stops. When REQD = 1, flush mode cannot be used.

After the transfer stops, set the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

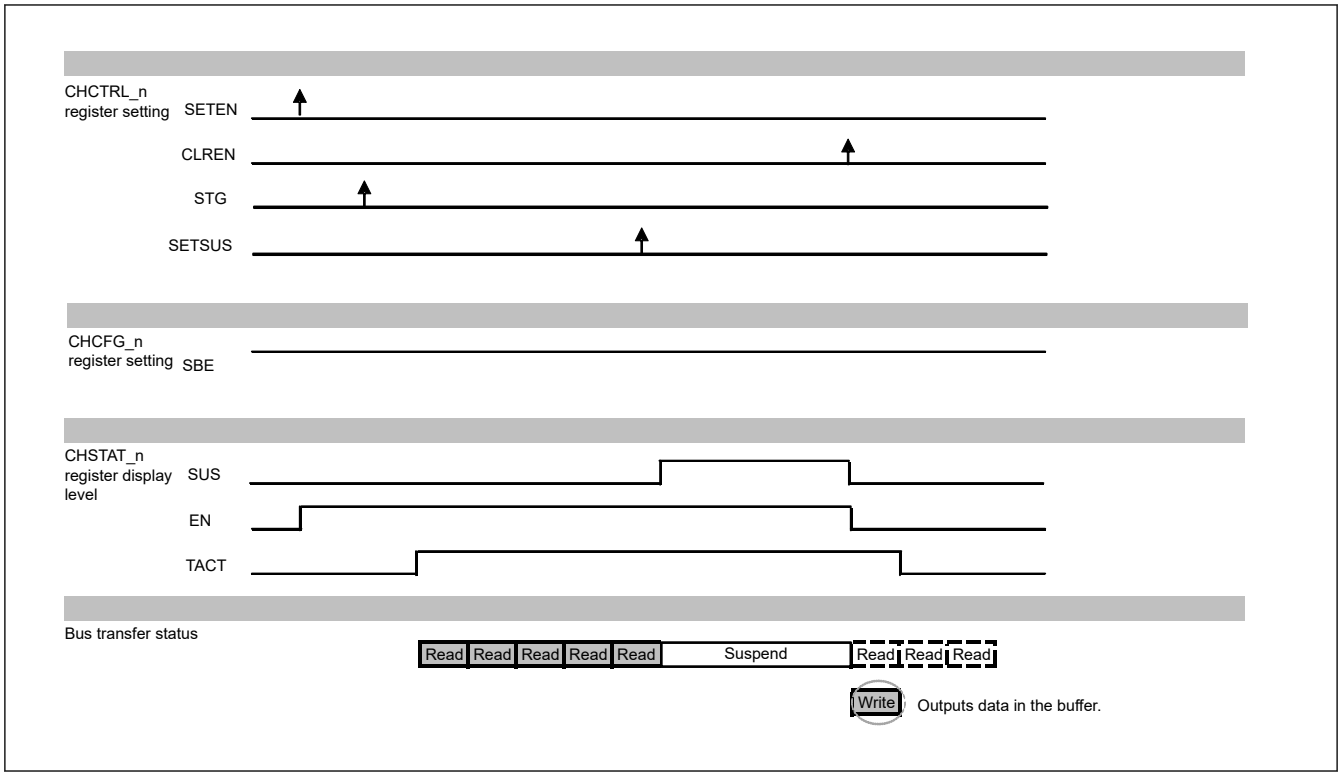

Figure 15.35 Aborting DMA transfer (buffer flush mode)

- Figure 15.35 shows an example when 1 is written to the CLREN bit in the CHCTRL_n register during the fifth read transfer in flush mode (the SBE bit in the CHCFG_n register = 1), and the transfer is aborted. It shows how read data is written, and the DMA transfer stops.
- When the TACT bit in the CHSTAT_n register is cleared to 0, you can confirm that the channel completely stops.

15.4.11.3 Checking if the Channel Stops

When 1 is written to the CLREN bit in the CHCTRL_n register, and the EN bit in the CHSTAT_n register is cleared to 0, if a transfer is already performed on a bus, DMAC cannot stop immediately. To check if DMA completely stops, make sure that the EN bit is cleared to 0, and the TACT bit in the CHSTAT_n register is cleared to 0.

15.4.11.4 Procedure for Aborting a Transfer

The following steps show the procedure for stopping a transfer:

1. Write 1 to the SETSUS bit in the CHCTRL_n register.
2. Perform polling until the SUS bit in the CHCTRL_n register is set to 1. If the EN bit = 0, go to step 6 because DMAC transfer is suspended.
3. Write 1 to the CLREN bit in the CHCTRL_n register.
4. When the SBE bit in the CHCFG_n register = 0, the transfer stops according to value for the REQD bit in the CHCFG_n register. At that time, if SBE = 1, flush mode is used.
5. By reading the CHSTAT_n register, make sure the TACT bit is cleared to 0. When TACT = 0, DMA stops completely. When TACT = 1, perform polling until the TACT bit is cleared to 0.
6. After a transfer is aborted, to perform the next DMA transfer, you must set the SWRST (software reset) bit in the CHCTRL_n register immediately before the next transfer starts.

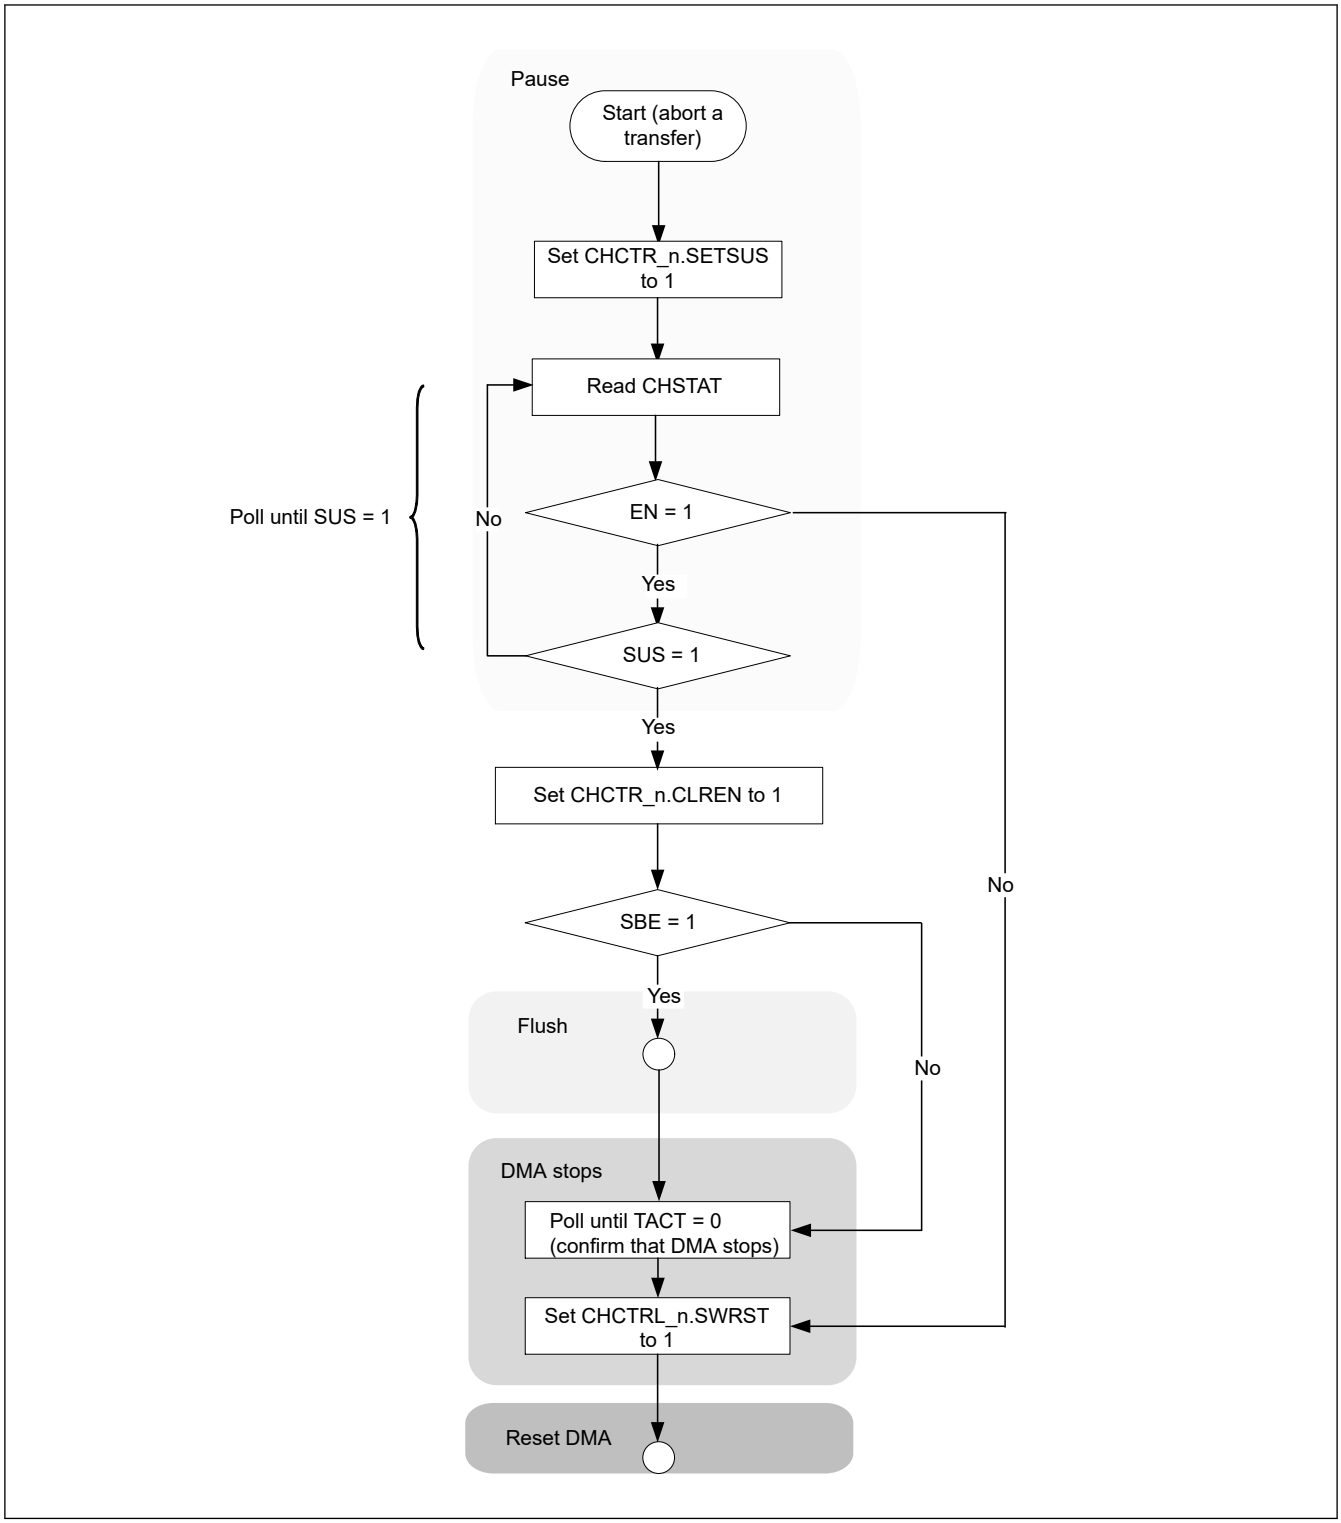

Figure 15.36 Operation flow for aborting a transfer

15.5 Interrupts

15.5.1 Interrupt Sources

DMAC has two types of interrupt sources, DMA transfer completion interrupts and DMA error interrupts for each channel. Table 15.23 shows the relationship among interrupt sources, enable bits, and status flags.

Table 15.23 Interrupt sources of DMAC

Interrupt source		Interrupt Enable bit	Interrupt Status flag	Output condition
DMA transfer completion interrupt	DMA transfer completion	CHCFG_n.DEM	CHSTAT_n.END	When a transfer for the total number of transfer bytes loaded to the CRTB_n register completes (after a write back if write back is performed in link mode)
	Descriptor invalid	DIM in header register		In link mode, when the header of the LV of the read descriptor = 0
DMA error interrupt		— (mask disabled)	CHSTAT_n.ER	When a bus error occurs during a DMA transfer and descriptor access

15.5.2 DMA Transfer Completion Interrupts

A DMA transfer completion interrupt is an interrupt request signal indicating that the DMA transfer completes. Each bit of the DMA transfer completion interrupt corresponds to each channel.

When the transfer of the total number of bytes loaded to the CRTB_n register is completed, the END bit in the CHSTAT_n register is set to 1. At that time, if the DEM bit in the CHCFG_n register = 0, a DMA transfer completion interrupt is generated (n = 0 to 15). To perform write back in link mode, an interrupt is generated after the write back.

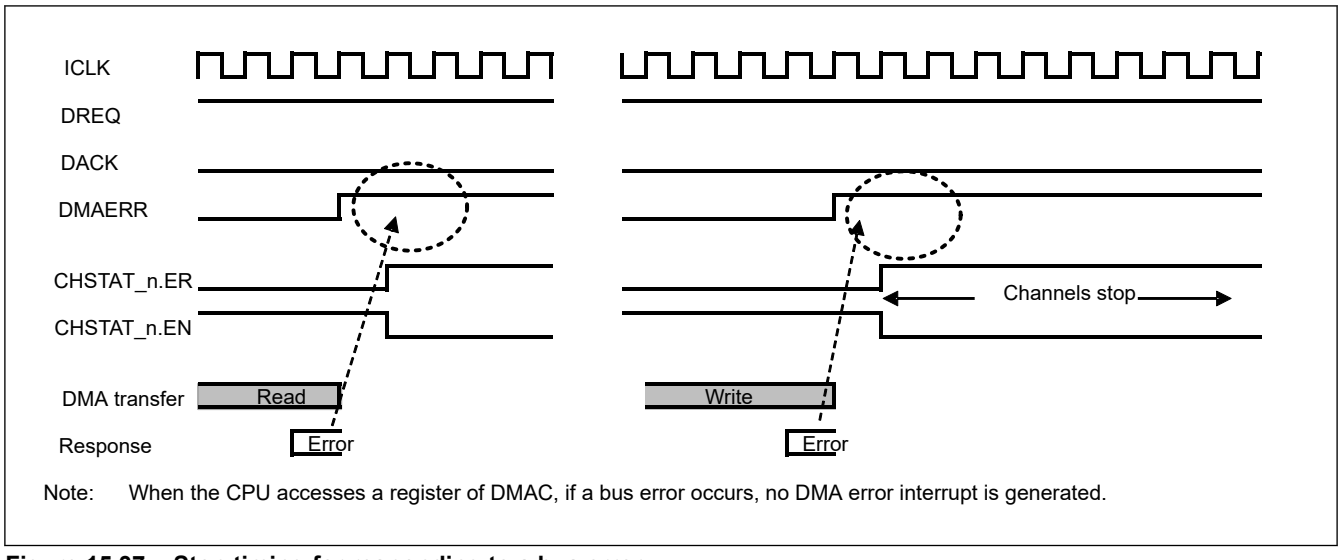
In addition, when link mode and header of the read descriptor is LV = 0, the DER bit in the CHSTAT_n register is set to 1. At that time, if the DIM bit in the header register = 0, a DMA transfer completion interrupt is generated.

15.5.3 DMA Error Interrupt

If a bus error occurs during a DMA transfer or descriptor access, this module determines that an error occurred, and stops the transfer. When a bus error occurs, the EN bit in the CHSTAT_n register for channel n where a transfer is performed is cleared to 0, and the ER bit is set to 1 (n = 0 to 15). In addition, a DMA error interrupt is generated. DMA error interrupts cannot be masked.

Data for a series of error transfers cannot be guaranteed. You must perform the transfer from the beginning by using the following procedure:

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Set each register again.



Note: When the CPU accesses a register of DMAC, if a bus error occurs, no DMA error interrupt is generated.

Figure 15.37 Stop timing for responding to a bus error

15.6 DMA Setting Examples

This section provides examples of DMA transfers. Table 15.24 lists the transfer conditions for the setting examples described in this section.

Table 15.24 List of transfer conditions for the DMA transfer setting examples

Setting example	DMA mode	Transfer mode	Transfer request
Setting example 1	Register mode	Single transfer mode	Hardware
Setting example 2	Register mode	Block transfer mode	Software
Setting example 3	Register mode (continuous execution)	Block transfer mode	Software
Setting example 4	Link mode	Block transfer mode	Software

15.6.1 Setting Example 1 (Register Hardware Request)

This section provides setting examples of DMA transfers that use hardware requests in register mode.

Table 15.25 DMA transfer setting example 1

Parameter		Description
Channel to use		DMAC0 channel 3
Priority control		Fixed priority
DMA mode		Register mode
Transfer mode		Single transfer mode
Register set to use		Next0 register set
Transfer source	Start address	0x4000_0000
	Address direction	Increment
	Data size	32 bits
Transfer destination	Start address	0x1000_0000
	Address direction	Increment
	Data size	32 bits
Number of DMA transfer bytes		64 bytes
DMA transfer request		Detects the rising edge by hardware (DREQ)
Selection of the side which makes a DMA transfer request		Requested from the transfer-side module
DACK/TEND signal		Outputs by level during read operation
DMA transfer completion interrupt mask		None

Setting Example 1

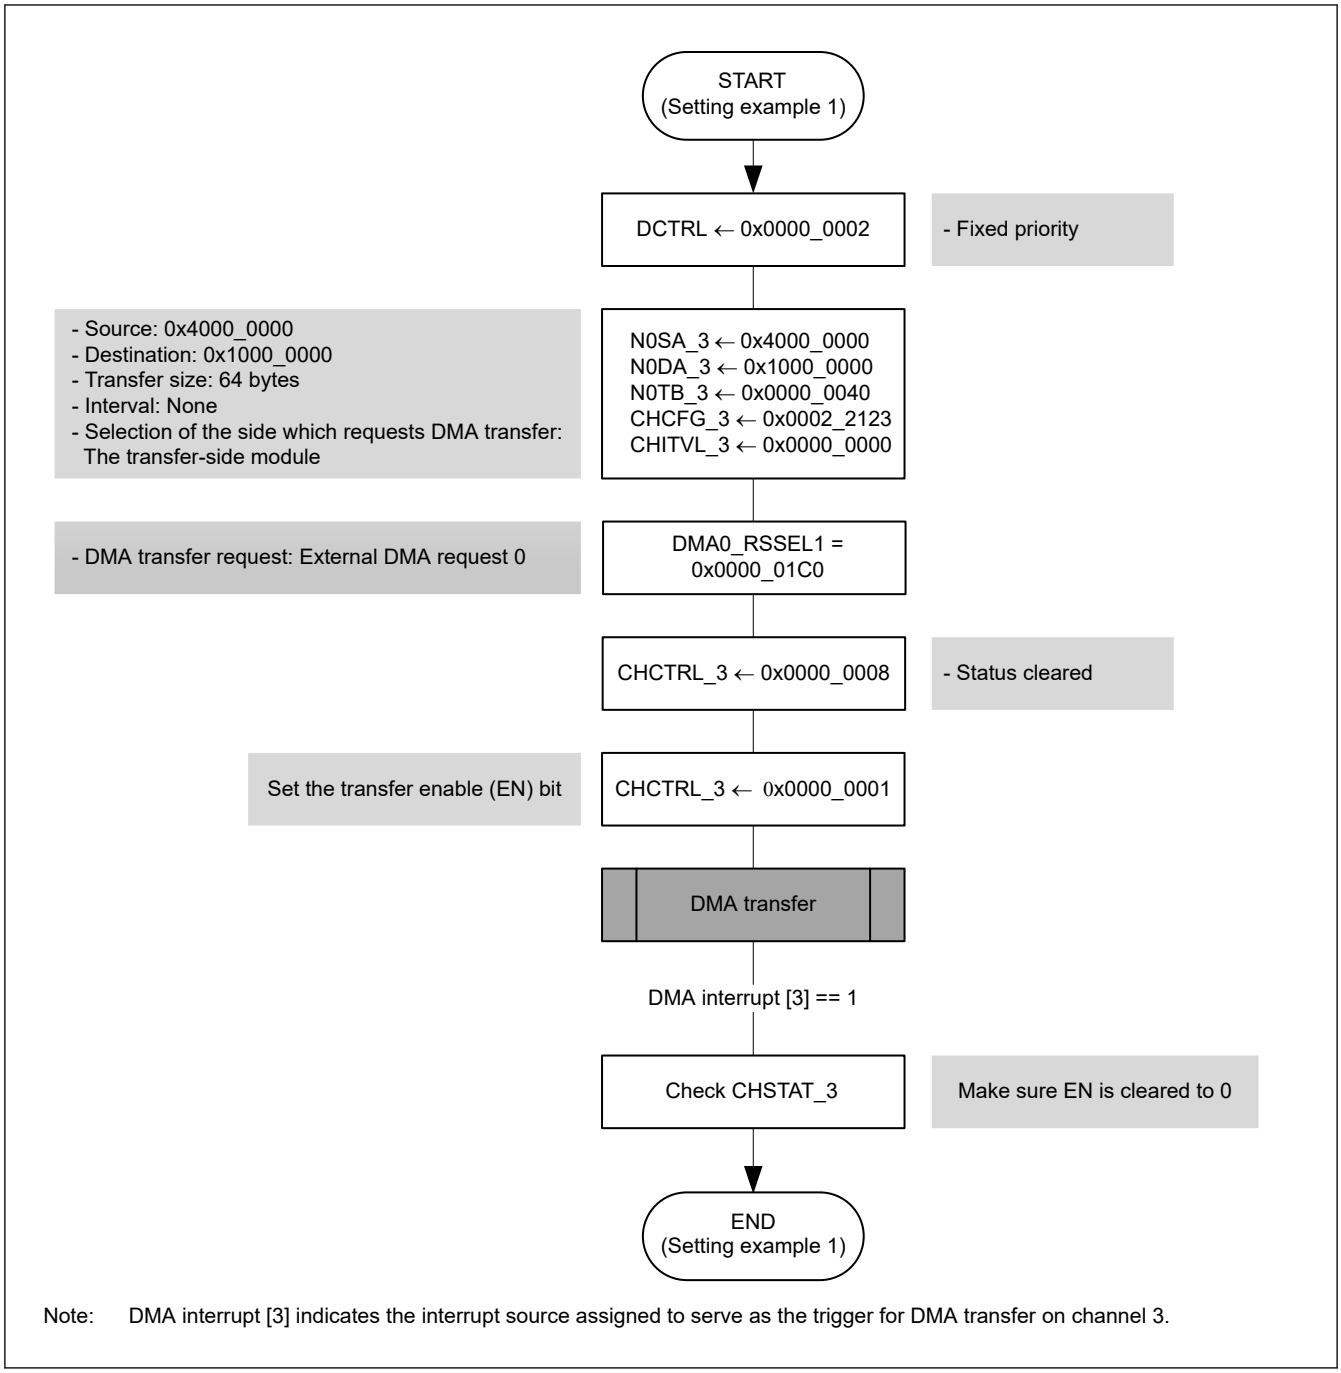
N0SA = 0x4000_0000 (transfer source address)

N0DA = 0x1000_0000 (transfer destination address)

N0TB = 0x0000_0040 (number of transfer bytes)

CHCFG = 0x0002_2123 (configuration)

CHITVL = 0x0000_0000 (interval)



Note: DMA interrupt [3] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 3.

Figure 15.38 Setting example 1

15.6.2 Setting Example 2 (Register Mode Software Request)

This section provides a setting example of DMA transfers that use software requests in register mode.

Table 15.26 DMA transfer setting example 2 (1 of 2)

Parameter	Description
Channel to use	DMAC0 channel 2
Priority control	Round-robin
DMA mode	Register mode
Transfer mode	Block transfer mode
Register set to use	Next1 register set

Table 15.26 DMA transfer setting example 2 (2 of 2)

Parameter		Description
Transfer source	Start address	0x1000_0000
	Address direction	Increment
	Data size	8 bits
Transfer destination	Start address	0x1000_1000
	Address direction	Increment
	Data size	256 bits
Number of DMA transfer bytes		128 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt mask		None

Setting Example 2

DCTRL = 0x0000_0003 (DMA setting)

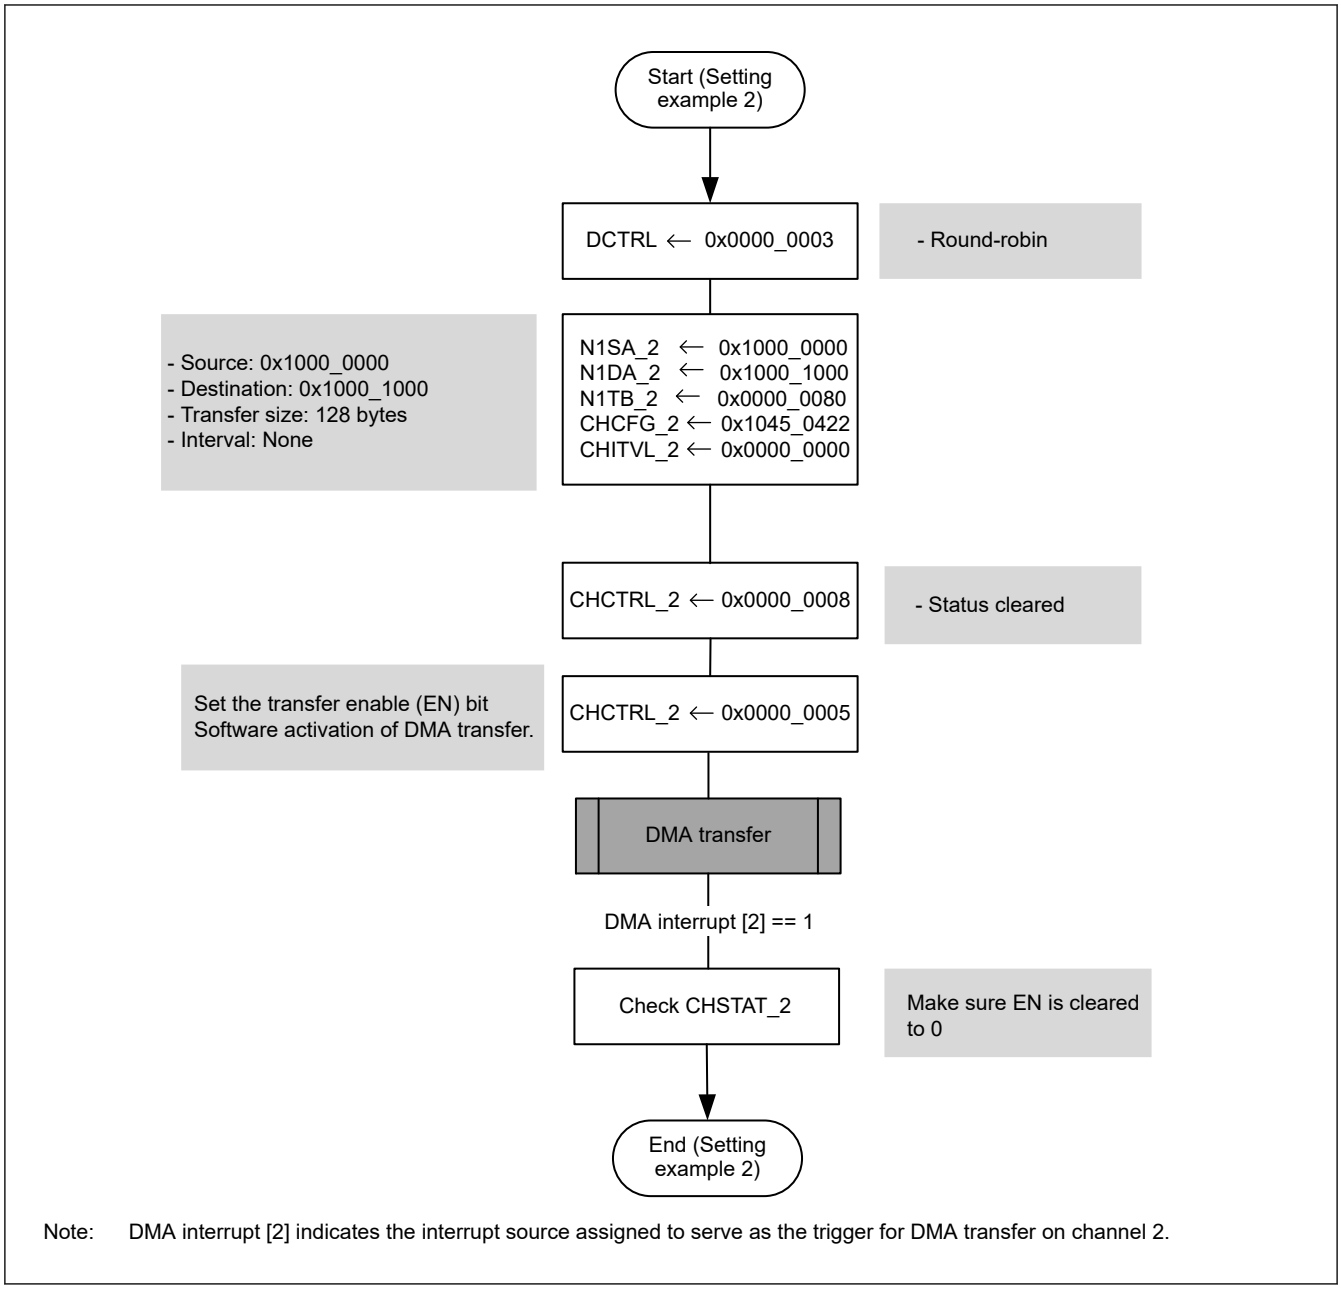
N1SA = 0x1000_0000 (transfer source address)

N1DA = 0x1000_1000 (transfer destination address)

N1TB = 0x0000_0080 (number of transfer bytes)

CHCFG = 0x1045_0422 (configuration)

CHITVL = 0x0000_0000 (interval)



Note: DMA interrupt [2] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 2.

Figure 15.39 Setting example 2

15.6.3 Setting Example 3 (Register Mode Continuous Execution)

This section provides a setting example of DMA transfers that use Next0/1 Register Sets in series in register mode.

Table 15.27 DMA transfer setting example 3 (1 of 2)

Parameter	Description
Channel to use	DMAC0 channel 1
Priority control	Round-robin
DMA mode	Register mode
Transfer mode	Block transfer mode
Register set to use	Next0 register set → Next1 register set in series

Table 15.27 DMA transfer setting example 3 (2 of 2)

Parameter		Description
Transfer source (Next0)	Start address	0x1000_4000
	Address direction	Fixed
	Data size	32 bits
	Number of DMA transfer bytes	512 bytes
Transfer destination (Next0)	Start address	0x1000_5000
	Address direction	Fixed
	Data size	512 bits
	Number of DMA transfer bytes	512 bytes
Transfer source (Next1)	Start address	0x1000_6000
	Address direction	Fixed
	Data size	32 bits
	Number of DMA transfer bytes	2048 bytes
Transfer destination (Next1)	Start address	0x1000_7000
	Address direction	Fixed
	Data size	512 bits
	Number of DMA transfer bytes	2048 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt mask		Masks when Next0 completes

Setting Example 3

DCTRL = 0x0000_0003 (DMA setting)

N0SA = 0x1000_4000 (transfer source address)

N0DA = 0x1000_5000 (transfer destination address)

N0TB = 0x0000_0200 (number of transfer bytes)

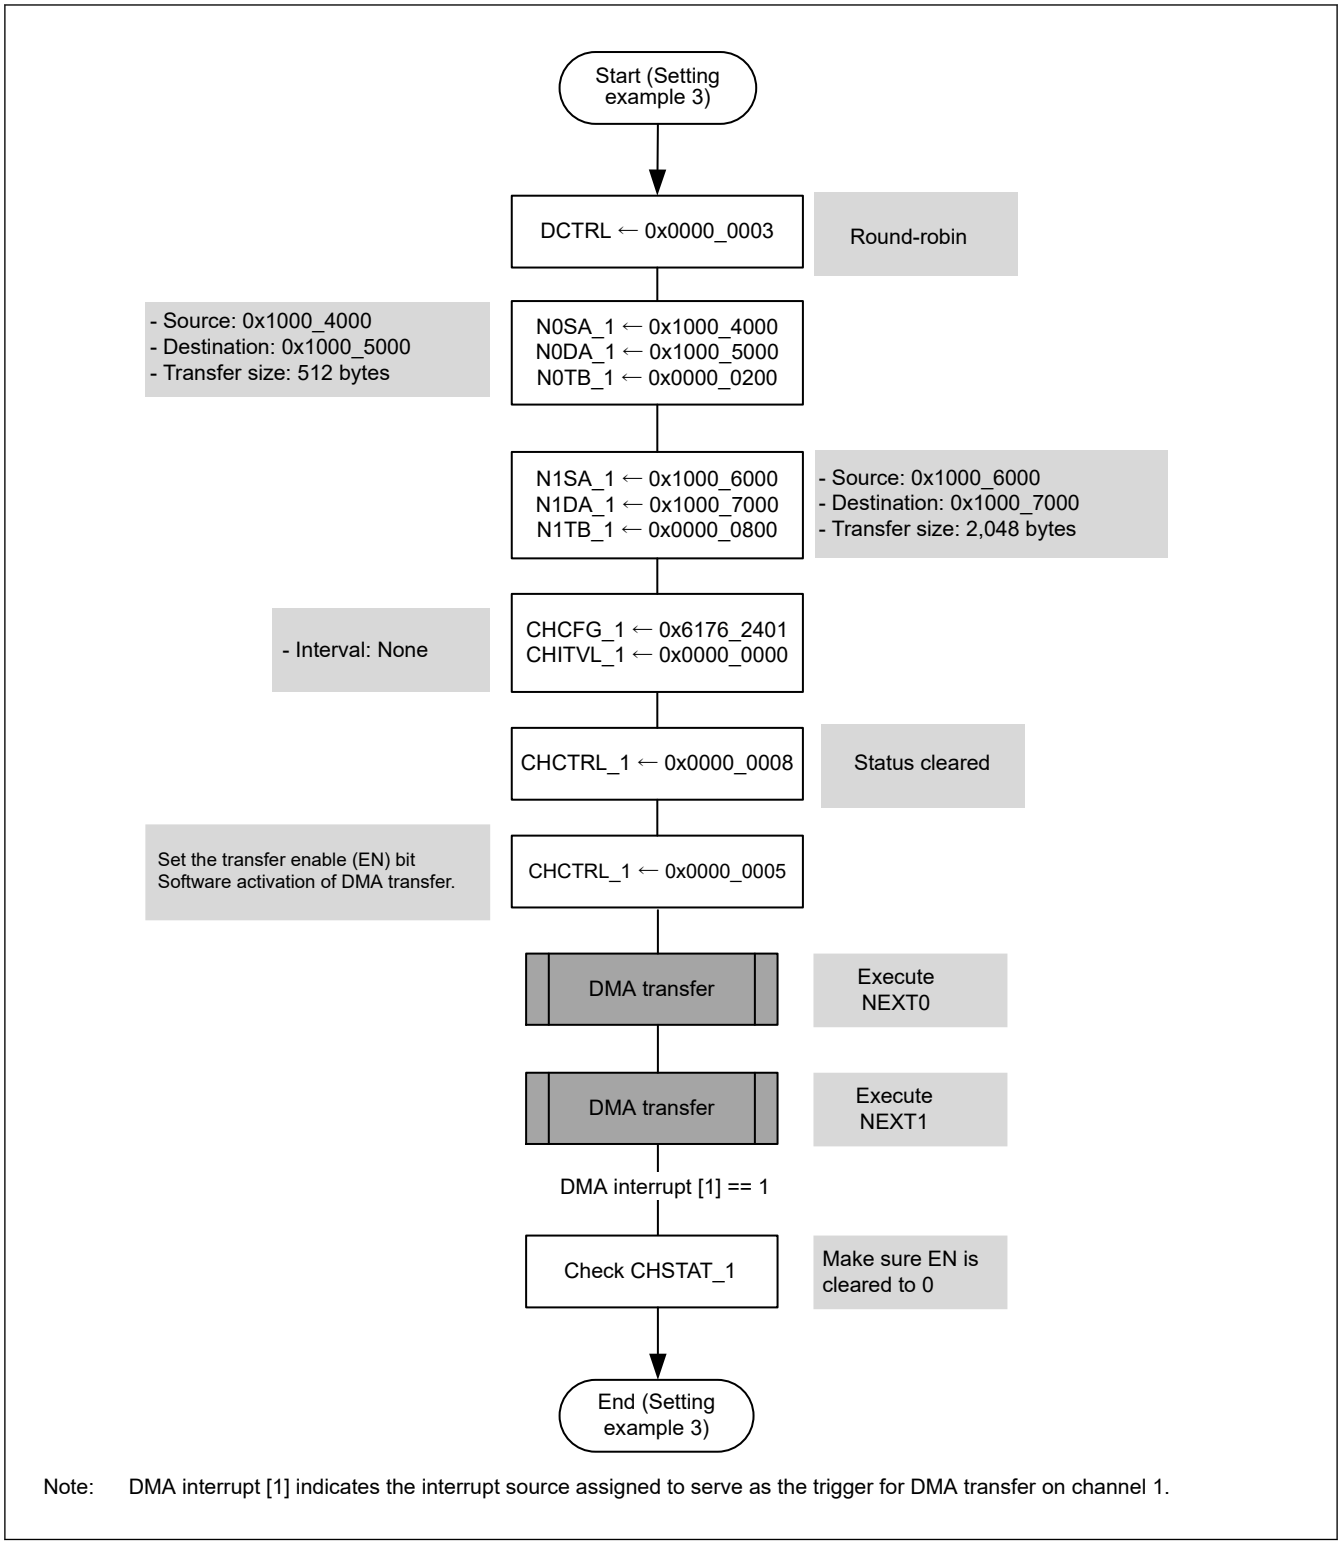
N1SA = 0x1000_6000 (transfer source address)

N1DA = 0x1000_7000 (transfer destination address)

N1TB = 0x0000_0800 (number of transfer bytes)

CHCFG = 0x6176_2401 (configuration)

CHITVL = 0x0000_0000 (interval)



Note: DMA interrupt [1] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 1.

Figure 15.40 Setting example 3

15.6.4 Setting Example 4 (Link Mode)

This section provides a setting example when a DMA transfer is performed in link mode.

Table 15.28 DMA transfer setting example 4 (1 of 2)

Parameter	Description
Channel to use	DMAC0 channel 0

Table 15.28 DMA transfer setting example 4 (2 of 2)

Parameter	Description
Priority control	Round-robin
DMA mode	Link mode
Transfer mode	Block transfer mode
Descriptor start address	0x1080_0000

Table 15.29 DMA transfer setting example 4 (descriptor 1)

Parameter		Description
Descriptor start address		0x1080_0000
Next descriptor start address		0x1080_1000
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_0000
	Address direction	Increment
	Data size	32 bits
Transfer destination	Start address	0x1000_1000
	Address direction	Increment
	Data size	32 bits
Number of DMA transfer bytes		2048 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt output mask		Masks when a DMA transfer on descriptor 1 completes
Descriptor header	DMA interrupt when LV =1	Issued (DIM = 0)
	LV write back	Done (WBD = 0)
	Next link address	Available (LE = 0)
	Descriptor valid	Valid (LV = 1)

Table 15.30 DMA transfer setting example 4 (descriptor 2) (1 of 2)

Parameter		Description
Descriptor start address		0x1080_1000
Next descriptor start address		0x1080_2000
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_2000
	Address direction	Increment
	Data size	256 bits
Transfer destination	Start address	0x1000_3000
	Address direction	Increment
	Data size	256 bits
Number of DMA transfer bytes		1024 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt output mask		Masks when a DMA transfer on descriptor 2 completes

Table 15.30 DMA transfer setting example 4 (descriptor 2) (2 of 2)

Parameter		Description
Descriptor header	DMA interrupt when LV =1	Issued (DIM = 0)
	LV write back	Done (WBD = 0)
	Next link address	Available (LE = 0)
	Descriptor valid	Valid (LV = 1)

Table 15.31 DMA transfer setting example 4 (descriptor 3)

Parameter		Description
Descriptor start address		0x1080_2000
Next descriptor start address		—
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_4000
	Address direction	Increment
	Data size	512 bits
Transfer destination	Start address	0x1000_6000
	Address direction	Increment
	Data size	512 bits
Number of DMA transfer bytes		4096 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt output mask		Do not mask
Descriptor header	DMA interrupt when LV =1	Issued (DIM = 0)
	LV write back	Done (WBD = 0)
	Next link address	Not available (LE = 1)
	Descriptor valid	Valid (LV = 1)

Setting Example 4

DCTRL = 0x0000_0003 (DMA setting)

NXLA = 0x1080_0000 (descriptor start address)

CHCFG = 0x8000_0000 (configuration)

Table 15.32 Descriptor settings

Parameter	Descriptor 1	Descriptor 2	Descriptor 3
Header	0x0000_0001	0x0000_0001	0x0000_0003
SA (Source Address)	0x1000_0000	0x1000_2000	0x1000_4000
DA (Destination Address)	0x1000_1000	0x1000_3000	0x1000_6000
TB (Transaction Bytes)	0x0000_0800	0x0000_0400	0x0000_1000
CFG (Configuration)	0x8142_2220	0x8145_5220	0x8046_6220
ITVL (Interval)	0x0000_0000	0x0000_0000	0x0000_0000
EXT (Extension)	0x0000_0000	0x0000_0000	0x0000_0000
NXLA (Next Link Address)	0x1080_1000	0x1080_2000	0x0000_0000

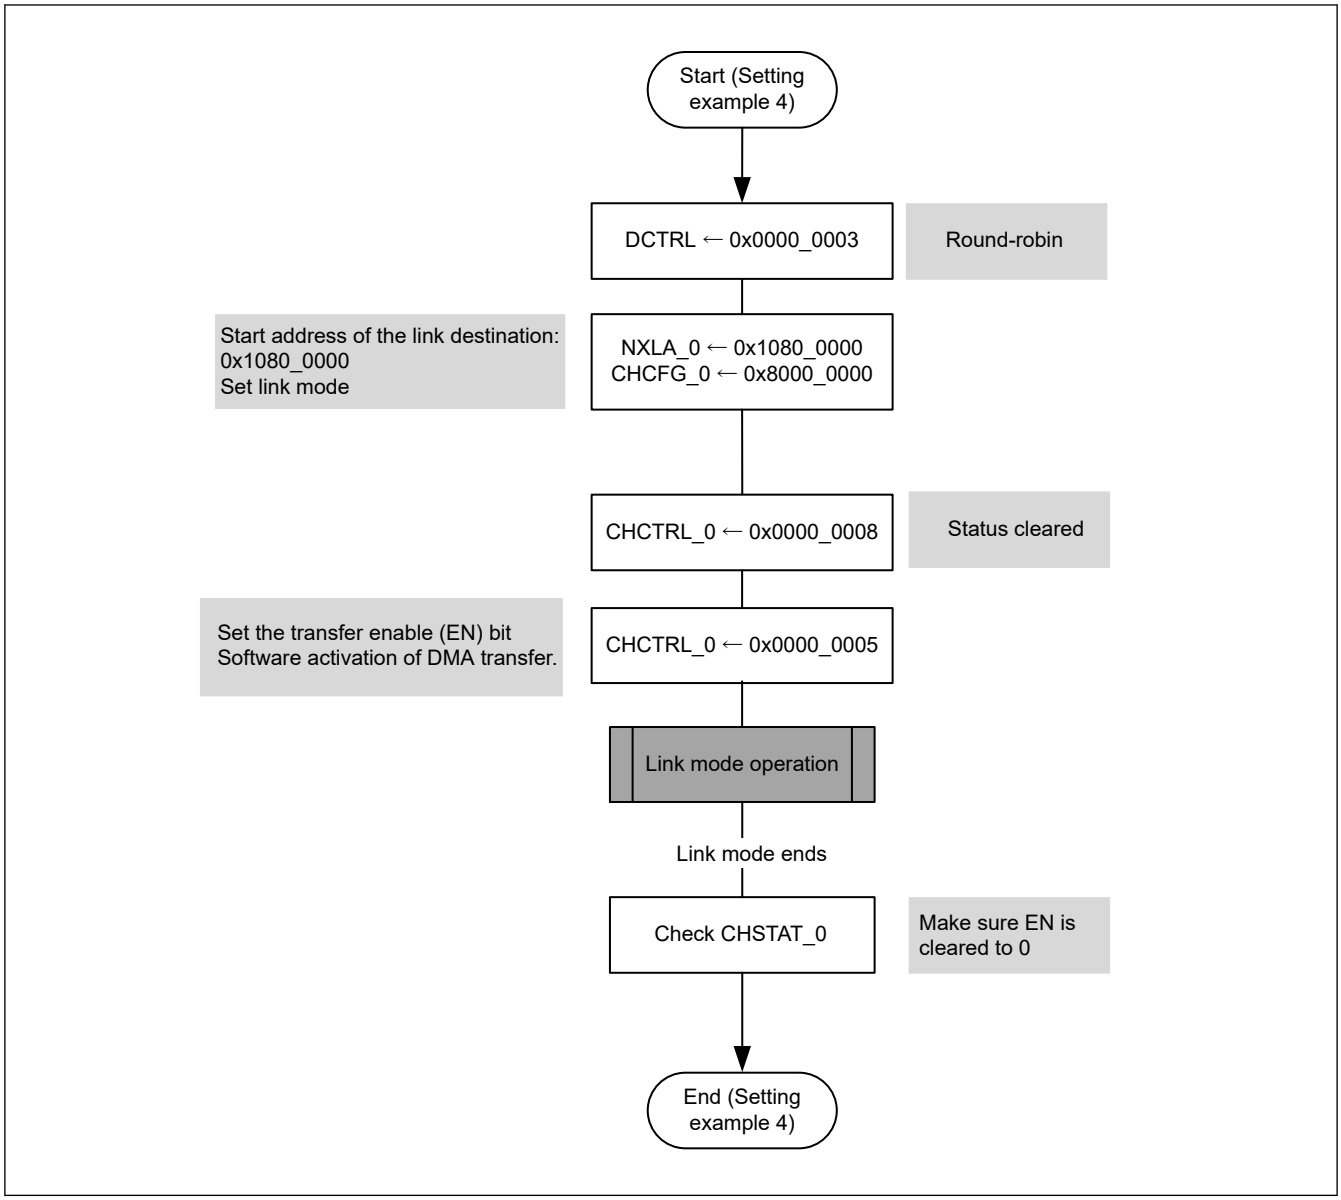


Figure 15.41 Setting example 4

15.6.5 Next Register Continuous Execution Settings

Figure 15.42 shows the flow when using two Next register sets to continue DMA transfers in register mode.

While performing a DMA transfer of a Next register, set the other Next register, and perform the DMA transfers in series.

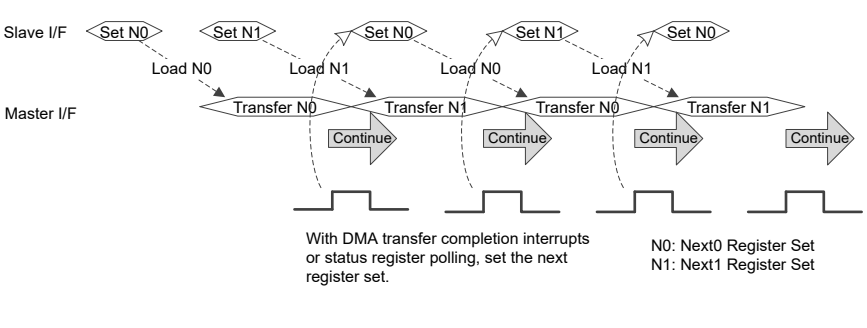

Figure 15.42 Flow for Next register continuous execution setting

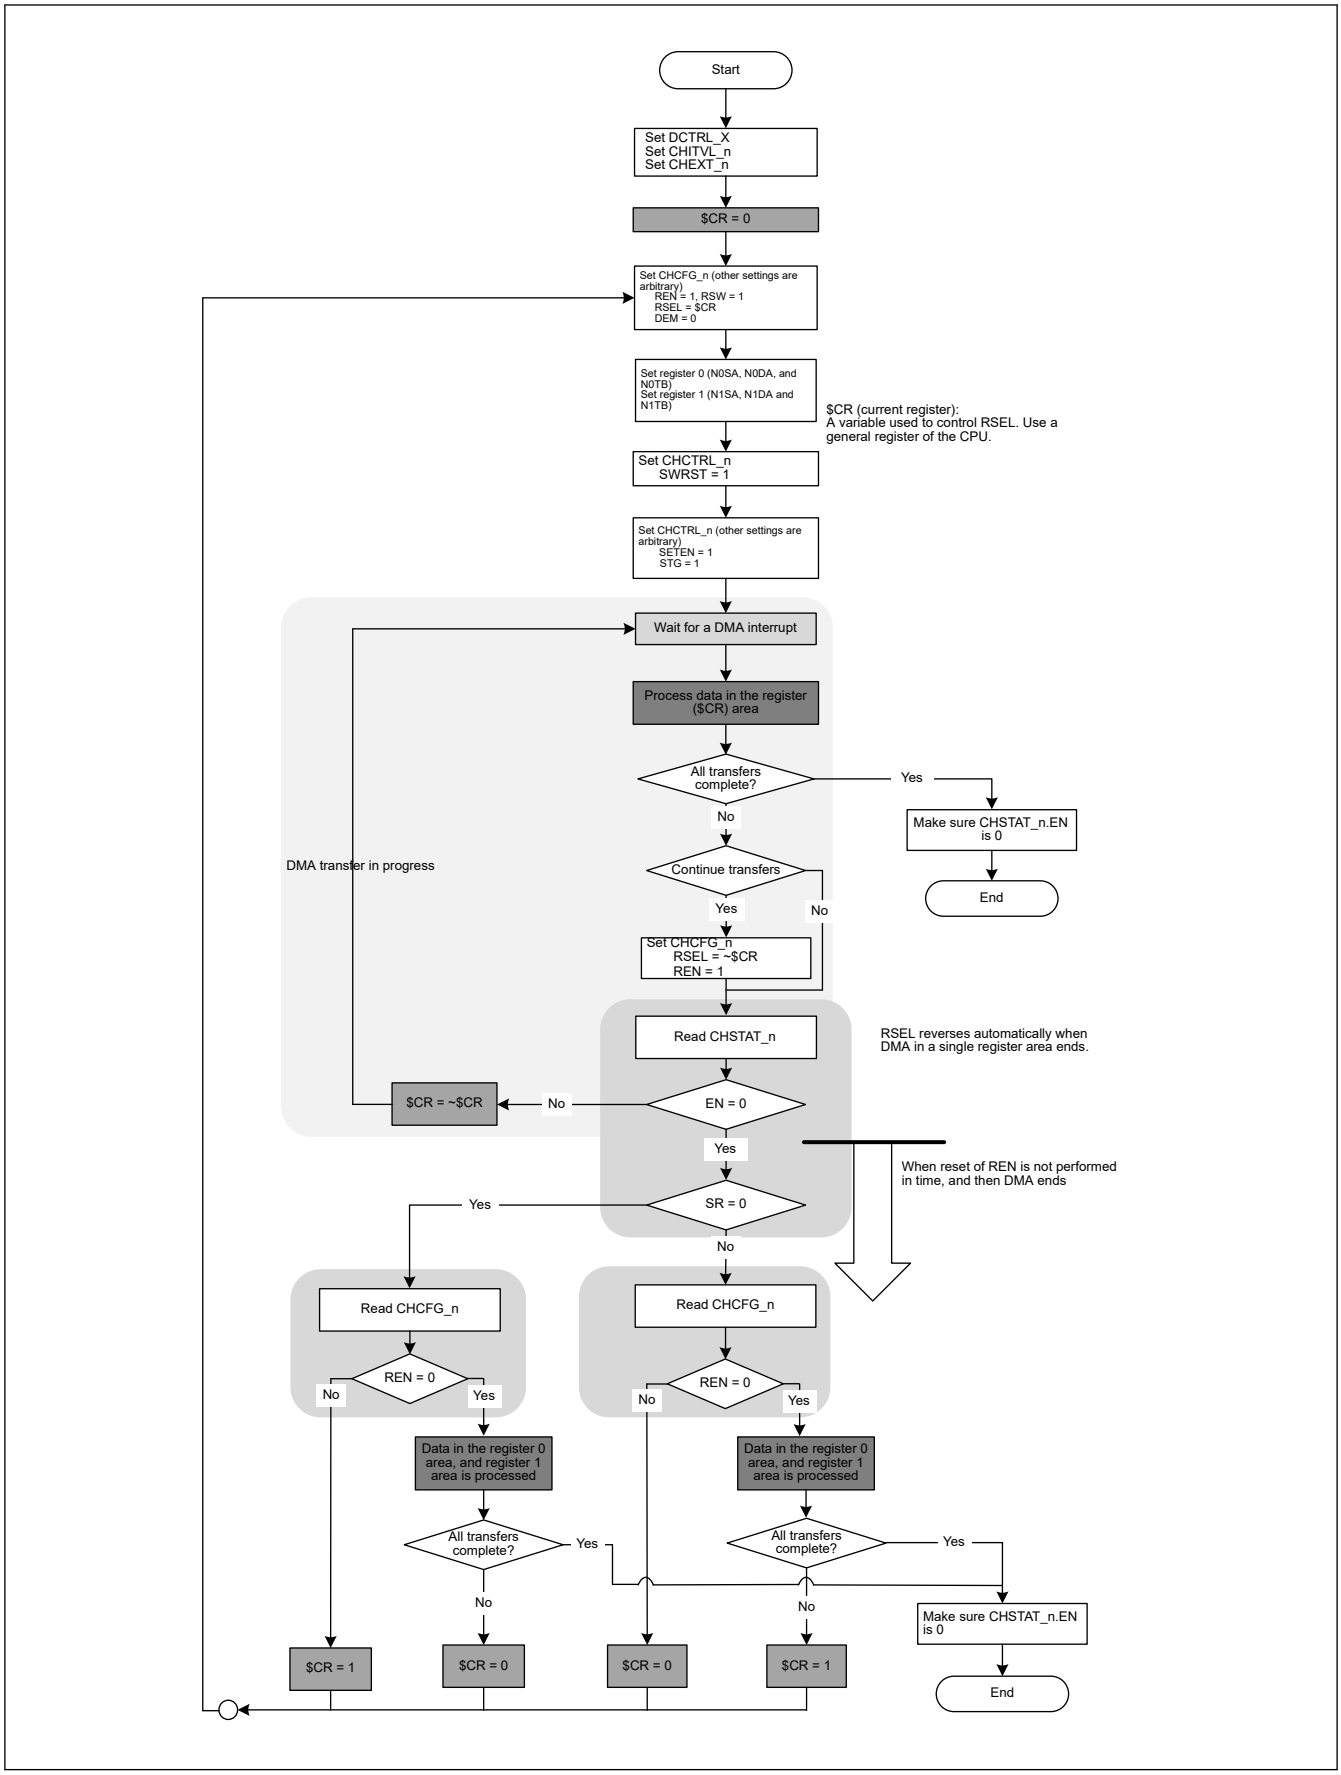

Figure 15.43 Setting example 5

(1) Supplementary information

Save the register sets 0 (N0SA_n, N0DA_n, and N0TB_n registers) and 1 (N1SA_n, N1DA_n, and N1TB_n registers) in a general register (call this register value $CR for convenience).

Every time a DMA transfer of a register set completes (a DMA transfer completion interrupt is generated), the REN bit in the CHCFG_n register is cleared to 0 automatically. To perform transfers in series, write 1 to the REN bit in the CHCFG_n register.

In this mode, two Next registers are executed in series. However, if the REN bit is not set before a DMA transfer completes (before the next DMA transfer completion interrupt is generated), the continuous execution stops. In this case, by reading the SR and EN bits in the CHSTAT_n register, and the REN bit in the CHCFG_n register, you can check how far the transfer has performed. To resume the transfer, perform the procedure described in Figure 15.43.

15.7 Usage Notes

This section provides notes on the DMA Controller module.

- When a transfer of which source and destination are the same, or partially shared area is performed, consistency of data cannot be guaranteed. Therefore, do not perform a transfer of which source and destination address areas overlap.
- For hardware activation, if REQD = 1 (the transfer destination issues a hardware request), SBE = 1 (flush mode) then the forced ejection function cannot be used. The transfer is deactivated by hardware.

15.7.1 When the DACK Signal is Divided and Output

When 4 bytes or more of data is transferred to an 8-bit or 16-bit external device, or 2 bytes or more of data is transferred to an 8-bit external device, a DMA transfer unit is divided into multiple bus cycles. The TEND signal outputs after the last DMA access completion.

When a DMA transfer is divided into multiple bus cycles and the CS signal is deactivated between bus cycles, DACK output is divided in the same way as the CS signal.

Figure 15.44 provides an example of DACK/TEND.

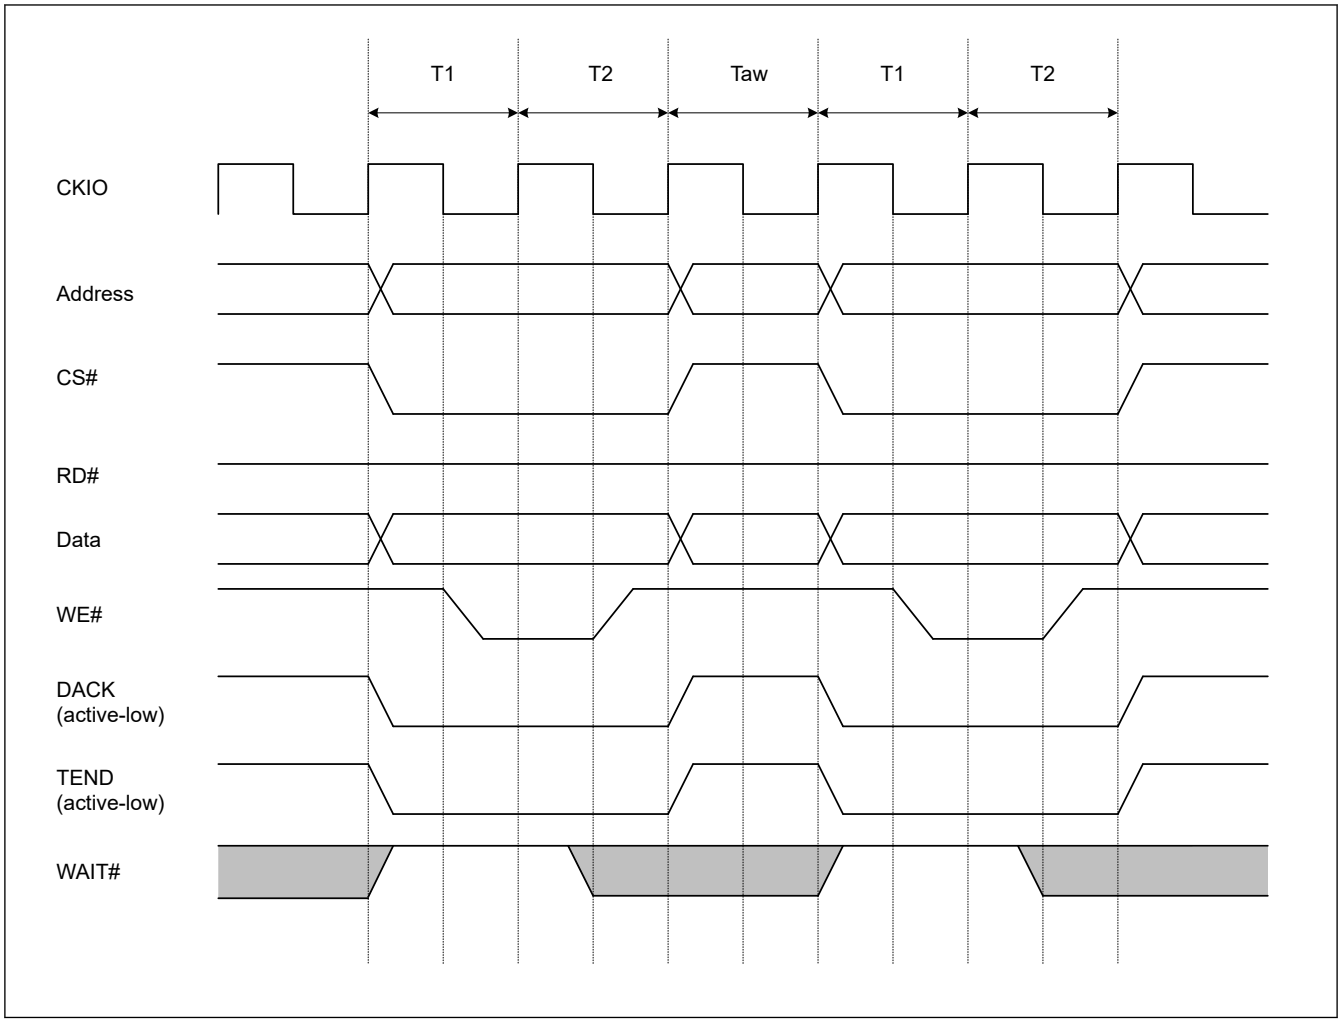

Figure 15.44 DACK divided output example

16. Event Link Controller (ELC)

16.1 Overview

The event link controller (ELC) connects (links) events generated by various peripheral modules to other modules. Event link allows direct cooperation among modules without CPU intervention.

Table 16.1 lists the specifications of the ELC and Figure 16.1 shows a block diagram.

Table 16.1 ELC specifications

Parameter	Specifications
Event link function	• 648 types of event signals can be directly connected to modules. • The operation of timer modules can be selected when an event is input to the timer module. • Event link operation is possible for Port 14 and Port 30. Single port*1: An event link can be set for a single bit specified in a port. Port group*1: An event link can be set for a group of single bits specified within eight I/O ports.

Note 1. The single port and port group specified as the input generate an event according to the change in the connected signal value.

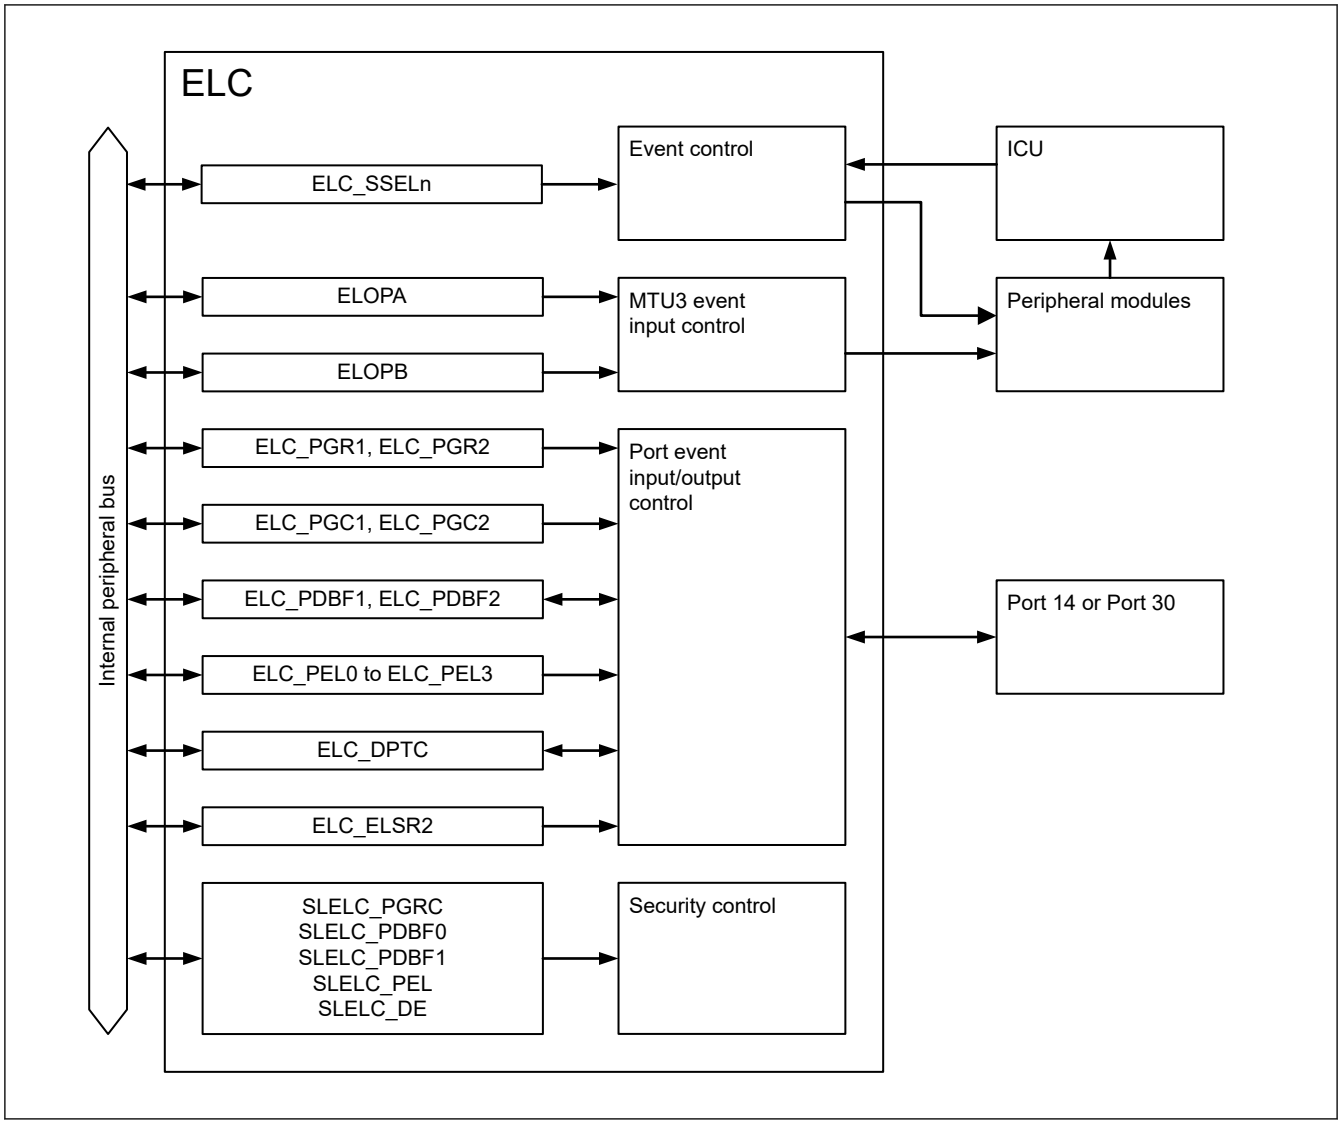

Figure 16.1 Block diagram of event link controller

16.2 Register Map

Table 16.2 ELC register map

Address	Register Symbol	Register Name	Write Protection
0x802A_0698 + 0x04 × n	ELC_SSELn	ELC Event Source Select Register n (n = 0 to 64)	—

Note 1. Access from Cortex-R52 CPU0 and CPU1 is not protected by TrustZone. This slave access control is applied to access from other masters.

16.3 Register Descriptions

This section describes details of the register functions.

16.3.1 ELC_SSELn : ELC Event Source Select Register n (n = 0 to 64)

Base address: ELC = 0x802A_0698

Offset address: 0x00 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:			ELC_SEL2[9:0]										ELC_SEL1[9:0]										ELC_SEL0[9:0]									
Value after reset:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
9:0	ELC_SEL0[9:0]	Set the number for ELC event source to be linked to the ELC destination. Event source is selectable from event table listed in section section 12.4.2. Event Table. If ELC function is not used, set 0x3FF (Disable ELC function). Setting of the number not allowed in event table is prohibited. See Table 16.4 for correspondence between register/bit assignment and ELC destination.	R/W
19:10	ELC_SEL1[9:0]		R/W
29:20	ELC_SEL2[9:0]		R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

The ELC_SSELn register specifies an event source to be linked to for each destination peripheral module. Event source number set in the ELC_SSELn register are listed in section section 12.4.2. Event Table. Table 16.4 lists the correspondence between the ELC_SSELn register/bits and the destination peripheral modules.

Table 16.4 Correspondence between the ELC_SSELn register and ELC destination (1 of 3)

Register name	Bit name	ELC destination	Register name	Bit name	ELC destination

16.3.2 ELOPA : Event Link Option Setting Register A

Base address: ELO = 0x8029_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MTU3MD[1:0]		—	—	—	—	MTU0MD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
1:0	MTU0MD[1:0]	MTU0 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU0.TCNT value is captured into MTU0.TGRA.) 1 1: Event is disabled.	R/W
5:2	—	These bits are read as 1. The write value should be 1.	R/W
7:6	MTU3MD[1:0]	MTU3 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU3.TCNT value is captured into MTU3.TGRA.) 1 1: Event is disabled.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ELOPA register determines the operation of MTU0 and MTU3 when an event is input. The event setting should be disabled when the ELC function is not used.

16.3.3 ELOPB : Event Link Option Setting Register B

Base address: ELO = 0x8029_0000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MTU4MD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
1:0	MTU4MD[1:0]	MTU4 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU4.TCNT value is captured into MTU4.TGRA.) 1 1: Event is disabled.	R/W
7:2	—	These bits are read as 1. The write value should be 1.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ELOPB register determines the operation of MTU4 when an event is input. The event setting should be disabled when the ELC function is not used.

16.3.4 ELC_PGRn : ELC Port Group Setting Register n (n = 1, 2)

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE00 + 0x01 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PG7	PG6	PG5	PG4	PG3	PG2	PG1	PG0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PG7 to PG0	Port Group Setting 0: The port bit is not specified as a member of the same group. 1: The port bit is specified as a member of the same group.	R/W

The ELC_PGRn register specifies a group for I/O port bits. This register specifies each port bit in the same eight I/O ports as the member of a group. One to eight port bits can be specified as the members of the same group as required.

Table 16.5 Registers related to port groups and corresponding port numbers

Port number	Port Group Setting Register (ELC_PGRn)	Port Group Control Register (ELC_PGCn)	Port Buffer Register (ELC_PDBFn)
Port 14	ELC_PGR1 register	ELC_PGC1 register	ELC_PDBF1 register
Port 30	ELC_PGR2 register	ELC_PGC2 register	ELC_PDBF2 register

16.3.5 ELC_PGCn : ELC Port Group Control Register n (n = 1, 2)

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE02 + 0x01 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PGCO[2:0]			—	PGCOVE	PGCI[1:0]	
Value after reset:	1	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
1:0	PGCI[1:0]	Event Output Edge Select 0 0: Event is generated on detection of the rising edge of the external input signal. 0 1: Event is generated on detection of the falling edge of the external input signal. 1 x: Event is generated on detection of both the rising and falling edges of the external input signal.	R/W
2	PGCOVE	PDBF Overwrite 0: Overwriting ELC_PDBFn register is disabled. 1: Overwriting ELC_PDBFn register is enabled.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
6:4	PGCO[2:0]	Port Group Operation Select 0 0 0: 0 is output when the event is input. 0 0 1: 1 is output when the event is input. 0 1 0: The toggled (inverted) value is output when the event is input. The target Port m Mode register should be set to 11b: Output (Output data is input to input buffer) 0 1 1: The buffer value is output when the event is input. 1 x x: Setting prohibited	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

For the output port group, the ELC_PGCn register specifies the form of outputting the signal externally via the port when the event signal is input. For the input port group, this register enables/disables overwriting of the ELC_PDBFn register and specifies the conditions of event generation (edge of the externally input signal).

16.3.6 ELC_PDBFn : ELC Port Buffer Register n (n = 1, 2)

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE04 + 0x04 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PB7	PB6	PB5	PB4	PB3	PB2	PB1	PB0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PB7 to PB0	Port Buffer n ● In case Port is output Data is transferred from ELC_PDBFn register to Pm register when an event is input. ● In case Port is input External input data is transferred to ELC_PDBFn register when an event is input. Write access to the bit specified as a member of the input port group is invalid.	R/W

The ELC_PDBFn register is an 8-bit readable/writable register used in combination with the ELC_PGRn register.

16.3.7 ELC_PELn : ELC Port Setting Register n (n = 0 to 3)

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE0C+ 0x01 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PSM[1:0]		PSP[1:0]		PSB[2:0]		
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	PSB[2:0]	Bit Number Specification A bit number in eight I/O ports is specified.	R/W
4:3	PSP[1:0]	Port Number Specification 0 0: Setting prohibited 0 1: Port 14 (corresponding to ELC_PGR1) 1 0: Port 30 (corresponding to ELC_PGR2) 1 1: Setting prohibited	R/W
6:5	PSM[1:0]	Event Link Specification For the output port, data to be output from the port is specified. For the input port, the edge on which the event is to be output is specified. 0 0: For the output port, 0 is output when the event is input. For the input port, the event is output on detection of the rising edge. 0 1: For the output port, 1 is output when the event is input. For the input port, the event is output on detection of the falling edge. 1 x: For the output port, the toggled (inverted) value is output when the event is input. For the input port, the event is output on detection of both the rising and falling edges. The target Port m Mode register should be set to 11b: Output (Output data is input to input buffer)	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

The ELC_PELn register specifies the single port to which an event is to be linked, the port operation on the event signal input, and the conditions of event generation. In this LSI, a total of 4 bits in Port 14 or Port 30 can be specified as single ports.

16.3.8 ELC_DPTC : ELC Edge Detection Control Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	PTC3	PTC2	PTC1	PTC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	PTC3 to PTC0	Single Input Port n Edge Detection 0: Disable edge detection for Single Input Port n 1: Enable edge detection for Single Input Port n	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

The ELC_DPTC register specifies input edge detection function for single input port linked to the event.

16.3.9 ELC_ELSR2 : ELC Port Event Control Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0xE11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PES3	PES2	PES1	PES0	PEG2	PEG1	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
3:2	PEG2 to PEG1	ELC Port Buffer Register (ELC_PDBFn) write access control. When set to 1, writing to the ELC_PDBFn register via Internal peripheral bus is disabled, preventing overwriting. 0: When not use event link function of input port group n 1: When use event link function of input port group n	R/W
7:4	PES3 to PES0	Single Port n Event Link Function Enable 0: Disable Single Port event link function 1: Enable Single Port event link function	R/W

The ELC_ELSR2 register specifies input port function linked to ELC. When enabled in this register, corresponding ELC_SSELn should be enabled.

16.3.10 SLELC_PGRC : ELC_PGR/ELC_PGC Security Level Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0x1E00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	ELC_PGC2_SL		—	—	—	—	—	—	ELC_PGC1_SL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ELC_PGR2_SL		—	—	—	—	—	—	ELC_PGR1_SL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ELC_PGR1_SL	ELC_PGR1 register Security Level	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	ELC_PGR2_SL	ELC_PGR2 register Security Level	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	ELC_PGC1_SL	ELC_PGC1 register Security Level	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	ELC_PGC2_SL	ELC_PGC2 register Security Level	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The SLELC_PGRC register is used to select the security level of the ELC_PGRn and ELC_PGCn registers. For details of security level, see section section 13.4.4.2. TrustZone Slave (TZS).

16.3.11 SLELC_PDBFn : ELC_PDBFn Security Level Register n (n = 1, 2)

Base address: PORT_NSR = 0x802C_0000

Offset address: 0x1E04 + 0x04 × (n − 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ELC_PDBF_SL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ELC_PDBF_SL	ELC_PDBFn register Security Level	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The SLELC_PDBFn register is used to select the security level of the ELC_PDBFn register. For details of security level, see section section 13.4.4.2. TrustZone Slave (TZS).

16.3.12 SLELC_PEL : ELC_PEL Security Level Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0x1E0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	ELC_PEL3_SL		—	—	—	—	—	—	ELC_PEL2_SL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ELC_PEL1_SL		—	—	—	—	—	—	ELC_PEL0_SL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ELC_PEL0_SL	ELC_PEL0 register Security Level	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	ELC_PEL1_SL	ELC_PEL1 register Security Level	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	ELC_PEL2_SL	ELC_PEL2 register Security Level	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	ELC_PEL3_SL	ELC_PEL3 register Security Level	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The SLELC_PEL register is used to select the security level of the ELC_PELn registers. For details of security level, see section section 13.4.4.2. TrustZone Slave (TZS).

16.3.13 SLELC_DE : ELC_DPTC/ELC_ELSR2 Security Level Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0x1E10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ELC_ELSR2_SL[1:0]		—	—	—	—	—	—	ELC_DPTC_SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ELC_DPTC_SL[1:0]	ELC_DPTC register Security Level	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	ELC_ELSR2_SL[1:0]	ELC_ELSR2 register Security Level	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

The SLELC_DE register is used to select the security level of the ELC_DPTC and ELC_DLSR2 registers. For details of security level, see section section 13.4.4.2. TrustZone Slave (TZS).

16.4 Operation

16.4.1 Event Linkage

ELC connects events generated by various source peripheral modules to other destination modules. It allows direct interlinked operation among source and destination modules without using software.

When source events are specified in the ELC_SSELn registers, the corresponding destination peripheral modules can be operated at generation of the specified events. A single destination peripheral module can link only with a single event source. Set the ELC_SSELn register after completing the initialization of the destination peripheral module to operate by an event. Table 16.6 lists the operations of destination peripheral modules when an event signal is input. When ELC is not used in the destination peripheral module, set 0x3FF to the corresponding ELC_SSELn register.

Table 16.6 ELC destination and operation (1 of 6)

No.	ELC destination	Operation
0	MTU0	The following operations can be selected by setting the ELOPA and ELOPB registers: ● Starts counting when an event signal is input ● Restarts counting when an event signal is input ● Performs input-capture operation when an event signal is input
1	MTU3	
2	MTU4	
3	GPT00 event A	The following operations can be selected by setting GPT registers in GPT00: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
4	GPT00 event B	
5	GPT00 event C	
6	GPT00 event D	
7	GPT00 event E	
8	GPT00 event F	
9	GPT01 event A	The following operations can be selected by setting GPT registers in GPT01: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
10	GPT01 event B	
11	GPT01 event C	
12	GPT01 event D	
13	GPT01 event E	
14	GPT01 event F	

Table 16.6 ELC destination and operation (2 of 6)

No.	ELC destination	Operation
15	GPT02 event A	The following operations can be selected by setting GPT registers in GPT02: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
16	GPT02 event B	
17	GPT02 event C	
18	GPT02 event D	
19	GPT02 event E	
20	GPT02 event F	
21	GPT03 event A	The following operations can be selected by setting GPT registers in GPT03: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
22	GPT03 event B	
23	GPT03 event C	
24	GPT03 event D	
25	GPT03 event E	
26	GPT03 event F	
27	GPT04 event A	The following operations can be selected by setting GPT registers in GPT04: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
28	GPT04 event B	
29	GPT04 event C	
30	GPT04 event D	
31	GPT04 event E	
32	GPT04 event F	
33	GPT05 event A	The following operations can be selected by setting GPT registers in GPT05: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
34	GPT05 event B	
35	GPT05 event C	
36	GPT05 event D	
37	GPT05 event E	
38	GPT05 event F	
39	GPT06 event A	The following operations can be selected by setting GPT registers in GPT06: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
40	GPT06 event B	
41	GPT06 event C	
42	GPT06 event D	
43	GPT06 event E	
44	GPT06 event F	
45	GPT07 event A	The following operations can be selected by setting GPT registers in GPT07: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input

16.4.2 Operation of MTU When Event is Input

The operations are performed depending on the ELOPA and ELOPB registers when an event is input.

16.4.2.1 Count Start Operation

When an event is input, the timer starts counting, which sets the count start bit[*1] in each timer control register to 1. An event that is input while the count start bit is 1 is invalid.

Note 1. Refer to the register descriptions on starting the timer in the relevant Peripheral Timer Module section.

16.4.2.2 Count Restart Operation

When an event is input, the timer counter is initialized. Since the count start bit*1 in each timer control register is retained, counting is restarted when an event signal is input while the count start bit is 1.

Note 1. Refer to the register descriptions on starting the timer in the relevant Peripheral Timer Module section.

16.4.2.3 Input Capture Operation

When an event is input, the timer performs input-capture operation.

16.4.3 Operation of GPT When Event is Input

Six event signals for each GPT00 to GPT08 and eight event signals for GPT09 are connected to every channel of each GPT unit as GPT event source A to F for GPT00 to GPT08 and A to H for GPT09. To set GPT operation when inputting an event signal, enable any of the event sources A to F for GPT00 to GPT08 and A to H for GPT09 by a corresponding bit in registers listed in Table 16.7.

Table 16.7 Operations when event is input and corresponding source select registers

Operations on event	Register symbol	Register name
Count start	GTSSR	General PWM Timer Start Source Select Register
Count stop	GTPSR	General PWM Timer Stop Source Select Register
Counter clear	GTCSR	General PWM Timer Clear Source Select Register
Up-count	GTUPSR	General PWM Timer Count-Up Source Select Register
Down-count	GTDNSR	General PWM Timer Count-Down Source Select Register
Input capture A	GTICASR	General PWM Timer Input Capture Source Select Register A
Input capture B	GTICBSR	General PWM Timer Input Capture Source Select Register B

16.4.4 Operation of A/D Converter When Event is Input

The A/D converter starts A/D conversion when the ADCSR.ADST bit*1 is set to 1.

Note 1. For details, see section 41, 12-Bit A/D converter (ADC12).

16.4.5 I/O Port Operation on Event Input and Event Generation

The I/O port operation to be performed on event input to the port and the operation causing the port to generate an event can be set.

16.4.5.1 Single Ports and Port Groups

There are two event link modes:

- Event link to single ports
- Event link to port groups

In the former mode, events can be connected to eight I/O ports. In the latter mode, events can be connected to port groups consisting of any two or more bits in the same eight I/O ports.

A single port can be set by specifying any bit in the I/O port*1 to which an event can be connected using the ELC_PELn register. A port group can be set by specifying any one or more bits in the I/O port*1 to which an event can be connected using the ELC_PGRn register. One input port group and one output port group can be set in the same I/O port.

If the I/O port bit is specified as both a single port and a member of a port group, both functions are enabled when the relevant port is input, whereas only the port group function is enabled when the relevant port is output.

Set the PMm register to select the direction of the I/O ports.

Note 1. Port 14 and Port 30

16.4.5.2 Single Input Port Operation on Event Generation

A single input port which is specified by the PMm register generates an event when the signal value of the external pin connected to the relevant port changes. The event generation condition is specified using the ELC_PELn register. An example of event linking operation by a single input port is shown as [1] in Figure 16.2.

16.4.5.3 Single Output Ports Operation on Event Input

When an event is input to a single output port which is specified by the PMm register, the signal of the external pin connected to the relevant port changes according to the settings of the ELC_PELn register. This changes the signal value of the external pin connected to the relevant port. An example of event linking operation by a single output port is shown as [2] in Figure 16.2.

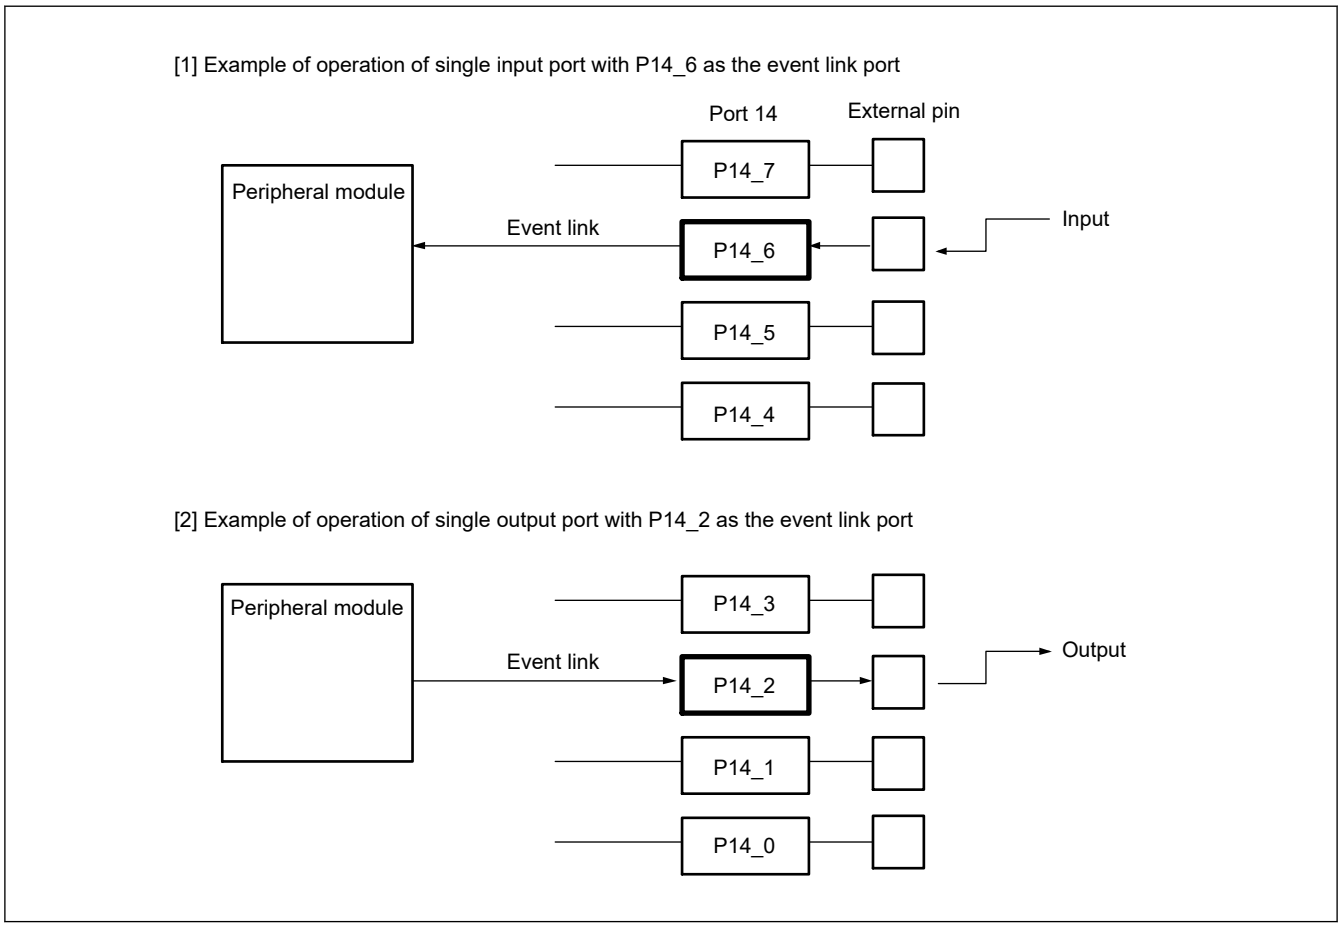

Figure 16.2 Event linkage related to single ports (port 14)

16.4.5.4 Input Port Group Operation on Event Generation

An input port group which is specified by the PMm register generates an event when the signal value of any one of the external pins connected to the relevant port group changes. The event generation condition is specified using the PGCIn bit of the ELC_PGCn register.

16.4.5.5 Input Port Group Operation on Event Input

When an event is input to an input port group, the signal value of the external pin on event input is transferred to the ELC_PDBFn register. In this case, only the values of the bits specified as members of the input port group are transferred. If another event is input to the input port group in this state, operations are performed depending on the ELC_PGCn.PGCOVE bit setting as described below. An example of operation is shown in Figure 16.3.

- ELC_PGCn.PGCOVE = 0 (overwriting is disabled)

If the value that was transferred to the ELC_PDBFn register on the previous event input has already been read by the CPU, the signal value of the external pin is transferred to the ELC_PDBFn register. If not read, the signal value of the external pin is not transferred and the input event is invalid.

- ELC_PGCn.PGCOVE = 1 (overwriting is enabled)
  When another event is input to an input port group, the signal value of the external pin is transferred to the ELC_PDBFn register.

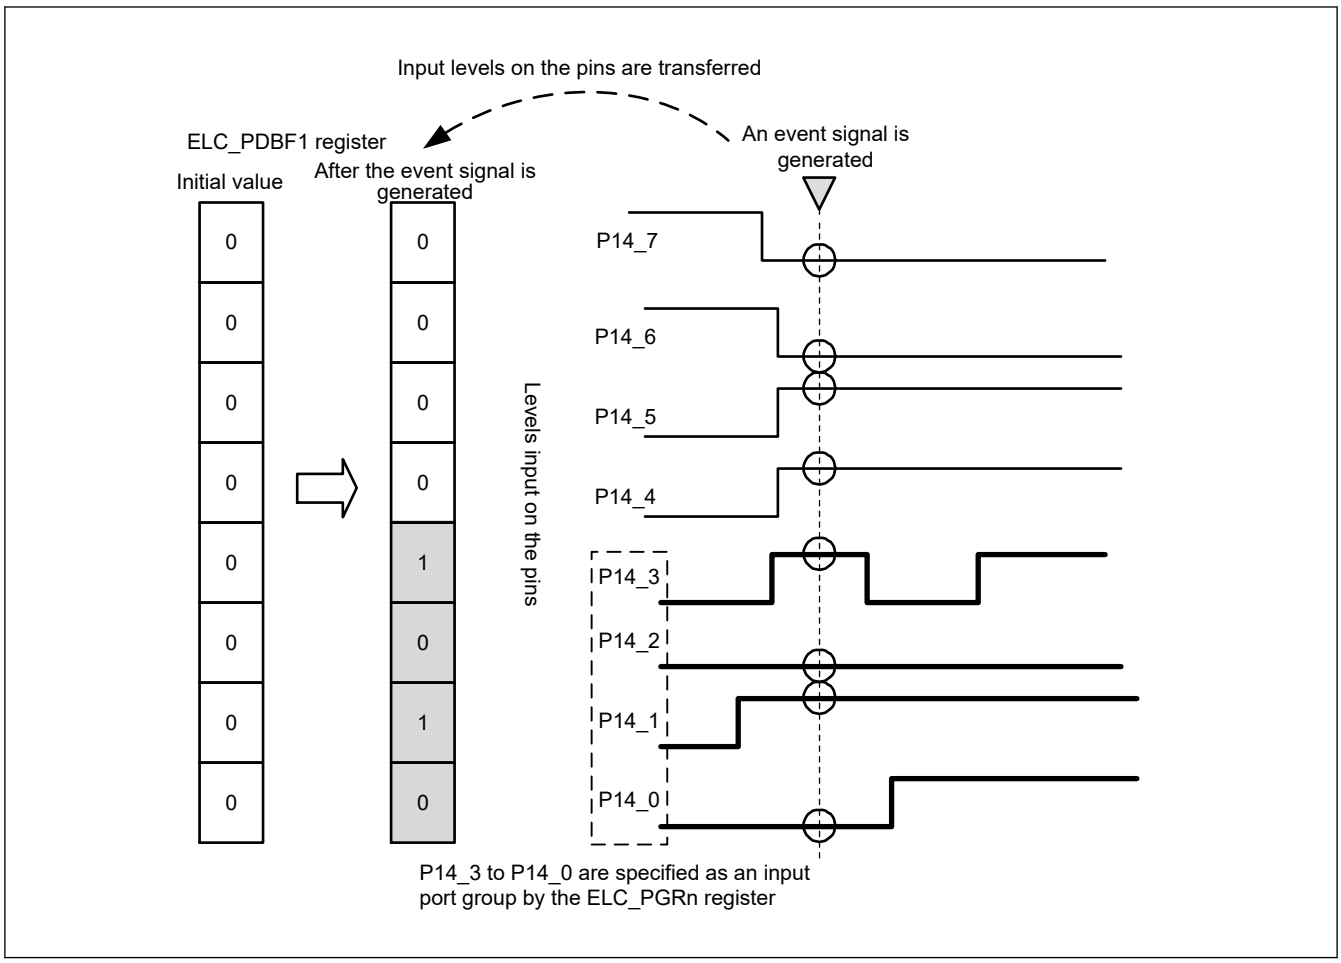

Figure 16.3 Input port group operation on event input (port 14)

16.4.5.6 Output Port Group Operation on Event Input

If an event is input to an output port group while the ELC_PGCn.PGCOn bit is 000b, 001b, or 010b, the Pm register value is changed to the value which was specified in the ELC_PGCn register.

If an event is input to an output port group while the ELC_PGCn.PGCOn bit is 011b, the ELC_PDBFn value is transferred to the Pm register of the port which was specified in the ELC_PGRn register. Example of operation of the output port group on an event input (when ELC_PGCn.PGCOn = 011b) is shown in Figure 16.4.

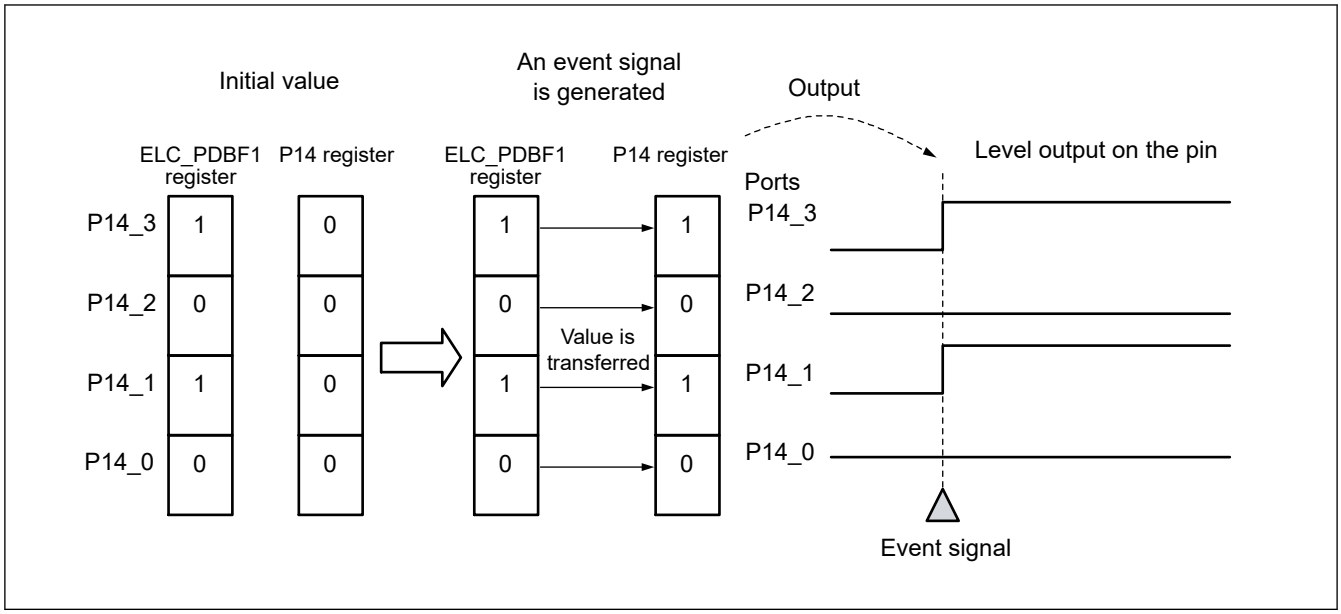

Figure 16.4 Event linkage operation of output port group (port 14)

16.4.5.7 Restrictions on Writing to Pm and ELC_PDBFn Registers by a CPU

For event linkage through the I/O ports, following restrictions apply when a CPU writes the Pm and ELC_PDBFn registers.

- If port bits are specified as members of the input port group, write access to the relevant bits in the ELC_PDBFn register is invalid.
- If port bits are specified as members of the output port group, write access to the relevant bits in the Pm register is invalid.
- If a port bit is specified as a single output port and the event linkage is set (by the ELC_SSELn register) for the port, write access to the relevant bit in the Pm register is invalid.

16.4.6 Example of Procedure for Linking Events

The following procedure describes the steps for linking events.

1. Set the operation of the module to which an event is to be linked.
2. If events are linked to ports, set the registers associated with the ports as follows:
   - I/O port setting
     Pm: Set the initial values of the output ports.
     PMm: Set the I/O direction of the ports.
   - ELC setting
     ELC_PGRn: If ports are used as a port group, set the ports (in bit units) to be grouped.
     ELC_PGCn: Set the operation of the port group.
     ELC_PELn: If ports are used as single ports, set the ports, the operation of the ports when an event is input, and the condition when an event is generated.
     ELC_DPTC: If pots are used as single input port edge detection, set the ports.
     ELC_ELSR2: If ports are used as input port groups, set the PEGn bits. If ports are used as single ports, set the PESn bits.
3. For the ELC_SSELn register associated with the module to which an event signal is to be linked, set the number of the event signal.
4. If events are to be linked to timer modules, set the ELOPA and ELOPB registers corresponding to the timers as required.
5. Set the operation of the module from which an event is output, and activate the module. This allows the event output from the module to start the module to which an event is linked as preset.
6. To stop event linkage of independent modules, set 0x3FF to ELC_SELx bits in the ELC_SSEL register corresponding to the modules.

Note: Setting the ELC_PDBFn register
- Output port groups
  Set the ELC_PGCn register before setting the ELC_PDBFn register. The value of the ELC_PGCn register can be modified if this precedes an event trigger which causes the value of the Pm register to change.
- Input port groups
  Setting the ELC_PDBFn is not required. However, since the value after a reset is 0x00, if the ELC_PDBFn register is used to confirm changes from H to L due to an event input, set the ELC_PDBFn bit for the pin for which you want to confirm this to be 1.

16.5 Usage Notes

16.5.1 Setting Clocks

To link events, it is necessary for the ELC and the related modules to be enabled. The modules cannot operate if the related modules are in the module-stop state or if the low power consumption mode causes the modules to stop (all-module stop mode).

17. I/O Ports

17.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, or interrupt input pins. All pins are set to non-use immediately after a reset (Hi-Z input protection) excluding P08_1 to P08_5 which are shared with JTAG pins and reset output pin. The pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

The configuration of the I/O ports differs depending on the package.

Table 17.1 shows the specifications of I/O ports.

Table 17.1 Specifications of I/O ports for 729/576-pin FCBGA (1 of 2)

17.4 Register Descriptions

17.4.1 Pm : Port m Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x000 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	POUT_7	POUT_6	POUT_5	POUT_4	POUT_3	POUT_2	POUT_1	POUT_0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W[*1]
7:0	POUT_0 to POUT_7	Pm_n Output Data Store (n: bit position) 0: Low output 1: High output	R/W

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. If access address is not region selected by RSELPm register, the bit is read only. (m = 00 to 12)

The Pm register holds the data to be output from the pins used for general I/O.

17.4.2 PMm : Port m Mode Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x200 + 0x002 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PM7[1:0]		PM6[1:0]		PM5[1:0]		PM4[1:0]		PM3[1:0]		PM2[1:0]		PM1[1:0]		PM0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
1:0	PM0[1:0]	Pm_0 I/O Select 0 0: Hi-Z 0 1: Input 1 0: Output (Output data is not input to input buffer) 1 1: Output (Output data is input to input buffer)	R/W
3:2	PM1[1:0]	Pm_1 I/O Select This function is the same as PM0[1:0].	R/W
5:4	PM2[1:0]	Pm_2 I/O Select This function is the same as PM0[1:0].	R/W
7:6	PM3[1:0]	Pm_3 I/O Select This function is the same as PM0[1:0].	R/W
9:8	PM4[1:0]	Pm_4 I/O Select This function is the same as PM0[1:0].	R/W
11:10	PM5[1:0]	Pm_5 I/O Select This function is the same as PM0[1:0].	R/W
13:12	PM6[1:0]	Pm_6 I/O Select This function is the same as PM0[1:0].	R/W
15:14	PM7[1:0]	Pm_7 I/O Select This function is the same as PM0[1:0].	R/W

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. If access address is not region selected by RSELPm register, the bit is read only. (m = 00 to 12)

The PMm register is used to select I/O function for the pins used for general I/O.

17.4.3 PMCm : Port m Mode Control Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x400 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PMC7	PMC6	PMC5	PMC4	PMC3	PMC2	PMC1	PMC0
Value after reset:	0	0	0*2	0*2	0*2	0*2	0*2	0

Bit	Symbol	Function	R/W*1
7:0	PMC0 to PMC7	Pm_n Pin Mode Control (n: bit position) 0: Uses the pin as a general I/O pin. 1: Uses the pin as an I/O port for peripheral functions.	R/W

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. If access address is not region selected by RSELPm register, the bit is read only. (m = 00 to 12)
Note 2. Value after reset is 1 for PMC1 to PMC5 bits in PMC08 register since JTAG (TMS, TDI, TDO and TCK) and RSTOUT# pins are selected at initial state.

The PMCm register is used to select the function of the pins of the port.

17.4.4 PFCm : Port m Function Control Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x600 + 0x008 × m

Bit position:	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
Bit field:	—	—	PFC7[5:0]						—	—	PFC6[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Bit field:	—	—	PFC5[5:0]						—	—	PFC4[5:0]					
Value after reset:	0	0	0	0	0	0	0	0*2	0	0	0	0	0	0	0	0*2

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	PFC3[5:0]						—	—	PFC2[5:0]					
Value after reset:	0	0	0	0	0	0	0	0*2	0	0	0	0	0	0	0	0*2

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PFC1[5:0]						—	—	PFC0[5:0]					
Value after reset:	0	0	0	0	0	0	0	0*2	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
5:0	PFC0[5:0]	Pm_0 Pin function Select Select one function from maximum 64 shared functions. For details of pin multiplex mapping, see section 17.5. Multiplexed Pin Configurations.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
13:8	PFC1[5:0]	Pm_1 Pin function Select This function is the same as PFC0[5:0].	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
21:16	PFC2[5:0]	Pm_2 Pin function Select This function is the same as PFC0[5:0].	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
29:24	PFC3[5:0]	Pm_3 Pin function Select This function is the same as PFC0[5:0].	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W
37:32	PFC4[5:0]	Pm_4 Pin function Select This function is the same as PFC0[5:0].	R/W
39:38	—	These bits are read as 0. The write value should be 0.	R/W
45:40	PFC5[5:0]	Pm_5 Pin function Select This function is the same as PFC0[5:0].	R/W
47:46	—	These bits are read as 0. The write value should be 0.	R/W
53:48	PFC6[5:0]	Pm_6 Pin function Select This function is the same as PFC0[5:0].	R/W
55:54	—	These bits are read as 0. The write value should be 0.	R/W
61:56	PFC7[5:0]	Pm_7 Pin function Select This function is the same as PFC0[5:0].	R/W
63:62	—	These bits are read as 0. The write value should be 0.	R/W

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. If access address is not region selected by RSELPm register, the bit is read only. (m = 00 to 12)

Note 2. Value after reset is 1 for PFC1[0] to PMC5[0] bits in PFC08 register since JTAG (TMS, TDI, TDO and TCK) and RSTOUT# pins are selected at initial state.

The PFCm register is used to select peripheral function for the pins.

17.4.5 PINm : Port m Input Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x800 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PIN7	PIN6	PIN5	PIN4	PIN3	PIN2	PIN1	PIN0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PIN0 to PIN7	Pm_n Pin Input (n: bit position) 0: Low input 1: High input	R

Note: Available pins depend on port group. For details, see Table 17.1.

The PINm register reflects the states of the individual input port pins.

17.4.6 DRCTLm : I/O Buffer m Function Switching Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0xA00 + 0x008 × m

Bit position:	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
Bit field:	—	—	SR7	SMT7	PUD7[1:0]		DRV7[1:0]		—	—	SR6	SMT6	PUD6[1:0]		DRV6[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Bit field:	—	—	SR5	SMT5	PUD5[1:0]		DRV5[1:0]		—	—	SR4	SMT4	PUD4[1:0]		DRV4[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	SR3	SMT3	PUD3[1:0]		DRV3[1:0]		—	—	SR2	SMT2	PUD2[1:0]		DRV2[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	SR1	SMT1	PUD1[1:0]		DRV1[1:0]		—	—	SR0	SMT0	PUD0[1:0]		DRV0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
1:0	DRV0[1:0]	Pm_0 Driving Ability Control 0 0: Low 0 1: Middle 1 0: High 1 1: Ultra High	R/W

Bit	Symbol	Function	R/W*1
3:2	PUD0[1:0]	Pm_0 Pull-Up/Down Control 0 0: No pull-up/down 0 1: Pull-up 1 0: Pull-down 1 1: Setting prohibited	R/W
4	SMT0	Pm_0 Schmitt Trigger Control 0: Disable Schmitt Trigger input 1: Enable Schmitt Trigger input	R/W
5	SR0	Pm_0 Slew Rate Control 0: Slow 1: Fast	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
9:8	DRV1[1:0]	Pm_1 Driving Ability Control This function is the same as DRV0[1:0].	R/W
11:10	PUD1[1:0]	Pm_1 Pull-Up/Down Control This function is the same as PUD0[1:0].	R/W
12	SMT1	Pm_1 Schmitt Trigger Control This function is the same as SMT0.	R/W
13	SR1	Pm_1 Slew Rate Control This function is the same as SR0.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
17:16	DRV2[1:0]	Pm_2 Driving Ability Control This function is same as DRV0[1:0].	R/W
19:18	PUD2[1:0]	Pm_2 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
20	SMT2	Pm_2 Schmitt Trigger Control This function is the same as SMT0.	R/W
21	SR2	Pm_2 Slew Rate Control This function is the same as SR0.	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
25:24	DRV3[1:0]	Pm_3 Driving Ability Control This function is same as DRV0[1:0].	R/W
27:26	PUD3[1:0]	Pm_3 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
28	SMT3	Pm_3 Schmitt Trigger Control This function is the same as SMT0.	R/W
29	SR3	Pm_3 Slew Rate Control This function is the same as SR0.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W
33:32	DRV4[1:0]	Pm_4 Driving Ability Control This function is same as DRV0[1:0].	R/W
35:34	PUD4[1:0]	Pm_4 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
36	SMT4	Pm_4 Schmitt Trigger Control This function is the same as SMT0.	R/W
37	SR4	Pm_4 Slew Rate Control This function is the same as SR0.	R/W
39:38	—	These bits are read as 0. The write value should be 0.	R/W
41:40	DRV5[1:0]	Pm_5 Driving Ability Control This function is same as DRV0[1:0].	R/W
43:42	PUD5[1:0]	Pm_5 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W

Bit	Symbol	Function	R/W*1
44	SMT5	Pm_5 Schmitt Trigger Control This function is the same as SMT0.	R/W
45	SR5	Pm_5 Slew Rate Control This function is the same as SR0.	R/W
47:46	—	These bits are read as 0. The write value should be 0.	R/W
49:48	DRV6[1:0]	Pm_6 Driving Ability Control This function is same as DRV0[1:0].	R/W
51:50	PUD6[1:0]	Pm_6 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
52	SMT6	Pm_6 Schmitt Trigger Control This function is the same as SMT0.	R/W
53	SR6	Pm_6 Slew Rate Control This function is the same as SR0.	R/W
55:54	—	These bits are read as 0. The write value should be 0.	R/W
57:56	DRV7[1:0]	Pm_7 Driving Ability Control This function is same as DRV0[1:0].	R/W
59:58	PUD7[1:0]	Pm_7 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
60	SMT7	Pm_7 Schmitt Trigger Control This function is the same as SMT0.	R/W
61	SR7	Pm_7 Slew Rate Control This function is the same as SR0.	R/W
63:62	—	These bits are read as 0. The write value should be 0.	R/W

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. If access address is not region selected by RSELPm register, the bit is read only. (m = 00 to 12)

The DRCTLm register is used to control function of I/O buffers. This register is valid even if the pin is used as either general I/O pin or an I/O port for peripheral functions in PMCm register.

17.4.7 RSELPm : Port m Region Select Register (m = 00 to 12)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)

Offset address: 0xC00 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RS7	RS6	RS5	RS4	RS3	RS2	RS1	RS0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RS0 to RS7	Pm_n pin I/O port registers Region Select (n = bit position) 0: Safety region (Address is 0x812C_0xxx) 1: Non safety region (Address is 0x802B_0xxx)	R/W*1

Note: Available pins depend on port group. For details, see Table 17.1.
Note 1. Access from 0x802B_0C00 + 0x001 × m is read only.

The RSELPm register is used to specify which is the attribution of the I/O port, Safety or Non safety. I/O ports registers except Non-safety dedicated I/O ports (m = 13 to 35) registers are defined two address, Safety region and Non safety region. When Safety region is selected in this register, access to Non safety region in I/O ports registers is limited to read-only though access to Safety region is allowed R/W. On the other hand, when Non safety region is selected in this register, access to Safety region in I/O ports registers is limited to read-only though access to Non safety region is allowed R/W. (Except PINm register due to read-only originally.)

17.4.8 SLPORTm : Port m Access Control Register (m = 00 to 35)

Base address: PORT_SRS = 0x812C_0000 (m = 00 to 12)
PORT_SRN = 0x802B_0000 (m = 00 to 12)
PORT_NSR = 0x802C_0000 (m = 13 to 35)

Offset address: 0x1000 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SL[1:0]	Pm group I/O ports registers Security Level 0 0: Security Level 0 0 1: Security Level 1 1 0: Security Level 2 1 1: Security Level 3	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

The SLPORTm register is used to specify the security level for Pm group I/O port registers (Pm, PMm, PMCm, PFCm, PINm, and DRCTLm). I/O port registers for all the pins in the same port group are set to the same security level which is specified in this register.

17.4.9 SLRSELP : RSELP Access Control Register

Base address: PORT_SRS = 0x812C_0000
PORT_SRN = 0x802B_0000

Offset address: 0x1C00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SL[1:0]	RSELPm (m = 00 to 12) register Security Level 0 0: Security Level 0 0 1: Security Level 1 1 0: Security Level 2 1 1: Security Level 3	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

The SLRSELP register is used to specify the security level for RSELPm registers (m = 00 to 12). All RSELPm registers (m = 00 to 12) are set to the same security level which is specified in this register.

17.4.10 SLPSR : Port Security Register Access Control Register

Base address: PORT_SRS = 0x812C_0000
PORT_SRN = 0x802B_0000

Offset address: 0x1F00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
1:0	SL[1:0]	Port security control register Security Level 0 0: Security Level 0 0 1: Security Level 1 1 0: Security Level 2 1 1: Security Level 3	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The SLPSR register is used to specify the security level for Port security control registers (SLPORTm (m = 00 to 12), SLRSELP, and RSELPSR). All the target registers are set to the same security level which is specified in this register.

17.4.11 SLPSRNS : Port NS Security Register Access Control Register

Base address: PORT_NSR = 0x802C_0000

Offset address: 0x1F00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
1:0	SL[1:0]	Port security control register and ELC security control register Security Level 0 0: Security Level 0 0 1: Security Level 1 1 0: Security Level 2 1 1: Security Level 3	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The SLPSRNS register is used to specify the security level for Port security control registers (SLPORTm (m = 13 to 35)) and ELC security control registers (SLELC_PGRC, SLELC_PDBFn, SLELC_PEL and SLELC_DE). All the target registers are set to the same security level which is specified in this register.

17.4.12 RSELPSR : Port Security Register Access Region Select Register

Base address: PORT_SRS = 0x812C_0000
PORT_SRN = 0x802B_0000

Offset address: 0x1F04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RS	Port security control register Region Select 0: Safety region (Address is 0x812C_1xxx) 1: Non-safety region (Address is 0x802B_1xxx)	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Access from 0x802B_1F04 is read only.

The RSELPSR register is used to specify which is the attribution of the Port security control registers (SLPORTm, SLRSELP, and SLPSR), Safety or Non-safety. Port security control registers are defined two address, Safety region and Non-safety region. When Safety region is selected in this register, access to Non-safety region in Port security control registers is limited to read-only though access to Safety region is allowed R/W. On the other hand, when Non-safety region is selected in this register, access to Safety region in Port security control registers is limited to read-only though access to Non-safety region is allowed R/W.

17.5 Multiplexed Pin Configurations

Select the function number with PFCn bit of Port m Function Control Register (PFCm: m = 00 to 35).

One of three types of IO buffers, Type A, B, or C is used each port. Depending on the IO type, recommended DRCTLm register setting may be different each peripheral function. For details, see Table 58.11.

Each port belongs to one voltage domain. Voltage domain VCC1833_n (n = 0 to 7) are selectable from 1.8 V or 3.3 V according to the selected peripheral function. When using Ethernet with RGMII, 1.8 V xSPI, or 1.8 V eMMC, supply 1.8 V to the corresponding voltage domain (VCC1833_n). When using SD, corresponding voltage domain (VCC1833_n) can be changed between 1.8 V and 3.3 V during operation. In other cases, supply 3.3 V to the corresponding voltage domain (VCC1833_n). Note that 1.8 V operation is not supported for other peripheral function than Ethernet with RGMII, xSPI, and SDHI.

17.6 Handling of Unused Pins

Details on the handling of unused pins are given in Table 17.41.

Table 17.41 Handling of unused pins (1 of 2)

Item	Pin name	Handling
Clock	XTAL	Keep this pin open when external clock signal is used.
	EXTAL	Connect this pin to VSS via a resistor (pulling down) when external clock signal is used.
	EXTCLKIN	Connect this pin to VSS via a resistor (pulling down) when a crystal resonator is connected.
Debug	TRST#	Connect these pins to VSS via a resistor (pulling down), or input the same signal as that on the RES# pin.
	TCK (P08_3)	Connect this pin to VSS via a resistor (pulling down).
	TMS (P08_1)	Connect this pin to VDD33 via a resistor (pulling up).
	TDI (P08_2)	Connect this pin to VDD33 via a resistor (pulling up).
	TDO (P08_4)	Keep this pin open.
System	RSTOUT# (P08_5)	Keep this pin open.
	MDX	— (Always connect this pin to VSS via a resister (pull down).)
	BSCANP	— (Use this as a boundary scan enable pin.)
ADC12*1	AN000 to AN003, AN100 to AN103, AN200 to AN214	Keep these pins open.
	AVDDREF_ADC0	Connect this pin to AVDDIO_ADC0.
	AVDDREF_ADC1	Connect this pin to AVDDIO_ADC1.
	AVDDREF_ADC2	Connect this pin to AVDDIO_ADC2.
USB*1	USB_QDP, USB_QDM, USB_OTG_ID	Keep these pins open.
	USB_VUBUSIN, USB_TXRTUNE	Connect these pins to VSS via a resistor (pulling down) or keep these pins open.
PCIE*1	PCIE_REFCLK_P0, PCIE_REFCLK_N0, PCIE_REFCLK_P1, PCIE_REFCLK_N1, PCIE_RXDP_L0, PCIE_RXDN_L0, PCIE_RXDP_L1, PCIE_RXDN_L1, PCIE_TXDP_L0, PCIE_TXDN_L0, PCIE_TXDP_L1, PCIE_TXDN_L1	Keep these pins open.
DDRSS*1	DDR_ZN	Connect this pin to DDR_VDDQ.
	DDR_DTEST, DDR_ATEST, DDR_RESET_N, DDR_CKA_T, DDR_CKA_C, DDR_CKB_T, DDR_CKB_C, DDR_CKEA[1:0], DDR_CKEB[1:0], DDR_CSA[1:0], DDR_CSB[1:0], DDR_CAA[5:0], DDR_CAB[5:0], DDR_DQA[15:0], DDR_DQB[15:0], DDR_DMIA[1:0], DDR_DMIB[1:0], DDR_DQSA_T[1:0], DDR_DQSB_T[1:0], DDR_DQSA_C[1:0], DDR_DQSB_C[1:0]	Keep these pins open.

Table 17.41 Handling of unused pins (2 of 2)

Item	Pin name	Handling
Other	Other Pins*2	Keep these pins open, connect them to VDD33 via a resistor (pulling up), or connect them to VSS via a resistor (pulling down).

Note 1. Set the module to the standby or low power mode. They are in such state after reset released. Do not change the state of the module.
Note 2. When handling them as unused pins, set the corresponding bits of Port m Mode Register (PMm: m = 00 to 35) to "Non-use (Hi-Z input protection)" which is the value after reset release.

17.7 Usage Notes

17.7.1 Release of Register Write Protection

PMCm, PFCm, DRCTLm, RSELPm, SLPORTm, SLRSELP, SLPSR, SLPSRNS, and RSELPSR registers are write protected. To release write protection, follow the steps below.

In case of access to 0x812C_xxxx and RSELPm = 0 for PMCm, PFCm, DRCTLm, and SLPORTm (m = 00 to 12),

In case of access to 0x802B_xxxx and RSELPm = 1 for PMCm, PFCm, DRCTLm, and SLPORTm (m = 00 to 12),

In case of access to 0x812C_xxxx or 0x802B_xxxx for RSELPm, SLRSELP, SLPSR, and RSELPSR:

1. Write 0x0000A504 to PRCRS register (Release write protection by PRC2 bit)
2. Write value to target registers
3. Write 0x0000A500 to PRCRS register (Set write protection by PRC2 bit)

In case of access to 0x802C_xxxx for PMCm, PFCm, DRCTLm, SLPORTm (m = 13 to 35), and SLPSRNS:

1. Write 0x0000A504 to PRCRN register (Release write protection by PRC2 bit)
2. Write value to target registers
3. Write 0x0000A500 to PRCRN register (Set write protection by PRC2 bit)

17.7.2 Safety and Non-safety I/O Port, and Region Select

I/O port consists of two types, Safety I/O and Non-safety I/O. Port 00 to 12 are Safety I/O port and Port 13 to 35 are Non-safety I/O port. Table 17.42 shows the features each I/O port type. Safety I/O port supports access from two separate addresses. Access attribute is controlled by region select register, RSELPm. Access attribute to TrustZone access control registers is controlled by RSELPSR register. Table 17.43 shows the access attribute by region select register.

Table 17.42 I/O Port type

Port	Type	Register address	Features
Port 00 to 12	Safety I/O Port	0x812C_xxxx or 0x802B_xxxx	• Access is possible from two separate addresses. • Selectable access attribute each address and each port. One is R/W and the other is Read only. • DMAC access is not available.
Port 13 to 35	Non-safety I/O Port	0x802C_0000	• DMAC access is available.

Table 17.43 Access attribute by Region Select register

Registers		Region Select	Access attribute each address	
			0x812C_xxxx (Safety region)	0x802B_xxxx (Non-safety region)
Port registers	Pm, PMm, PMCm, PFCm, DRCTLm	RSELPm = 0	R/W	R
		RSELPm = 1	R	R/W
	PINm	—	R	R
TrustZone Access Control registers	SLPORTm, SLRSELP, SLPSR	RSELPSR = 0	R/W	R
		RSELPSR = 1	R	R/W
Region Select registers	RSELPm, RSELPSR	—	R/W	R

Note: m = 00 to 12

17.7.3 Port Register TrustZone Access Control

Access to the Port registers is protected by TrustZone access control. Figure 17.2 shows the overview of the access control. Security level of access to the SLPSR and SLPSRNS register is fixed to 3. It cannot be changed. SLPSR controls the security level of access to the SLPORTm (m = 00 to 12), SLRSELP, and RSELPSR registers. SLPSRNS controls the security level of access to the SLPORTm (m = 13 to 35) registers. SLPORTm registers control the security level of access to the Pm, PMm, PMCm, PFCm, PINm, and DRCTLm registers (m = 00 to 35). SLRSELP register controls the security level of access to the RSELPm register.

SLPSRNS also controls the security level of access to the ELC registers. See section 16, Event Link Controller (ELC) for ELC registers.

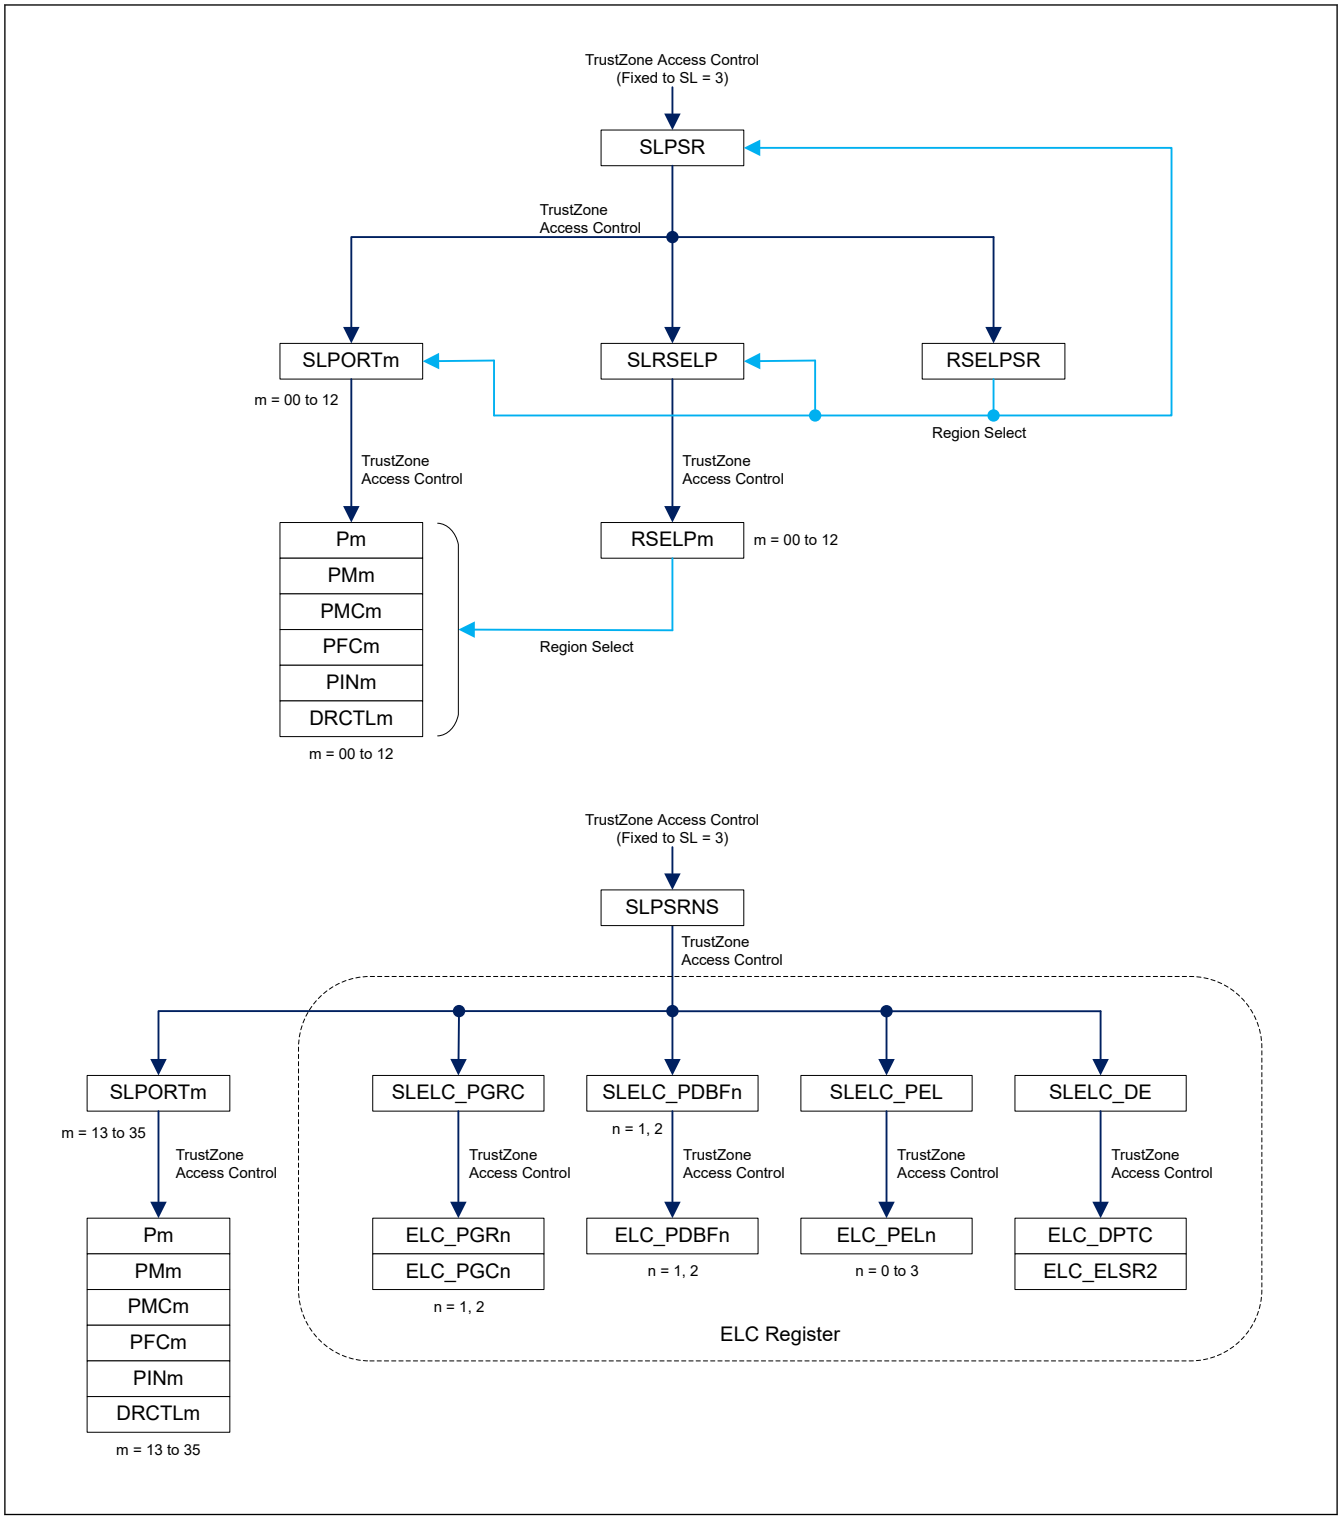

Figure 17.2 Overview of the port register TrustZone access control and Region Select

17.7.4 Examples of Port Setting

The registers to be controlled are shown in Table 17.44.

Table 17.44 Port register configuration

Register name		Bit name	Description
GPIO control register	Pm	POUT_n	Port register
	PMm	PMn	Port mode register
	PINm	PINn	Port input register
Multiplexed function select register	PMCm	PMCn	Port mode control register
	PFCm	PFCn	Port function control register
I/O Buffer function switching register	DRCTLm	DRVn	Port driving ability control
		PUDn	Port Pull-Up/Down control
		SMTn	Port Schmitt trigger control
		SRn	Port slew rate control

Note: m: 00 to 35, n: 0 to 7

Table 17.45 is overview of the mode register settings for the pin function.

Table 17.45 Pin function configuration overview

Mode	PMCm.PMCn	PMm.PMn	Pm.POUT_n	PINm.PINn	I/O
General I/O input	0	01	x	Input value	I
General I/O output	0	1x	Output value	(Input value)	O
I/O port for peripheral functions*1	1	x	—	—	I/O

Note: m: 00 to 35, n: 0 to 7
Note 1. When PMCm.PMCn = 1, select pin function by PFCm.PFCn.

Figure 17.3 is an example flow of setting the Port Pm_n.

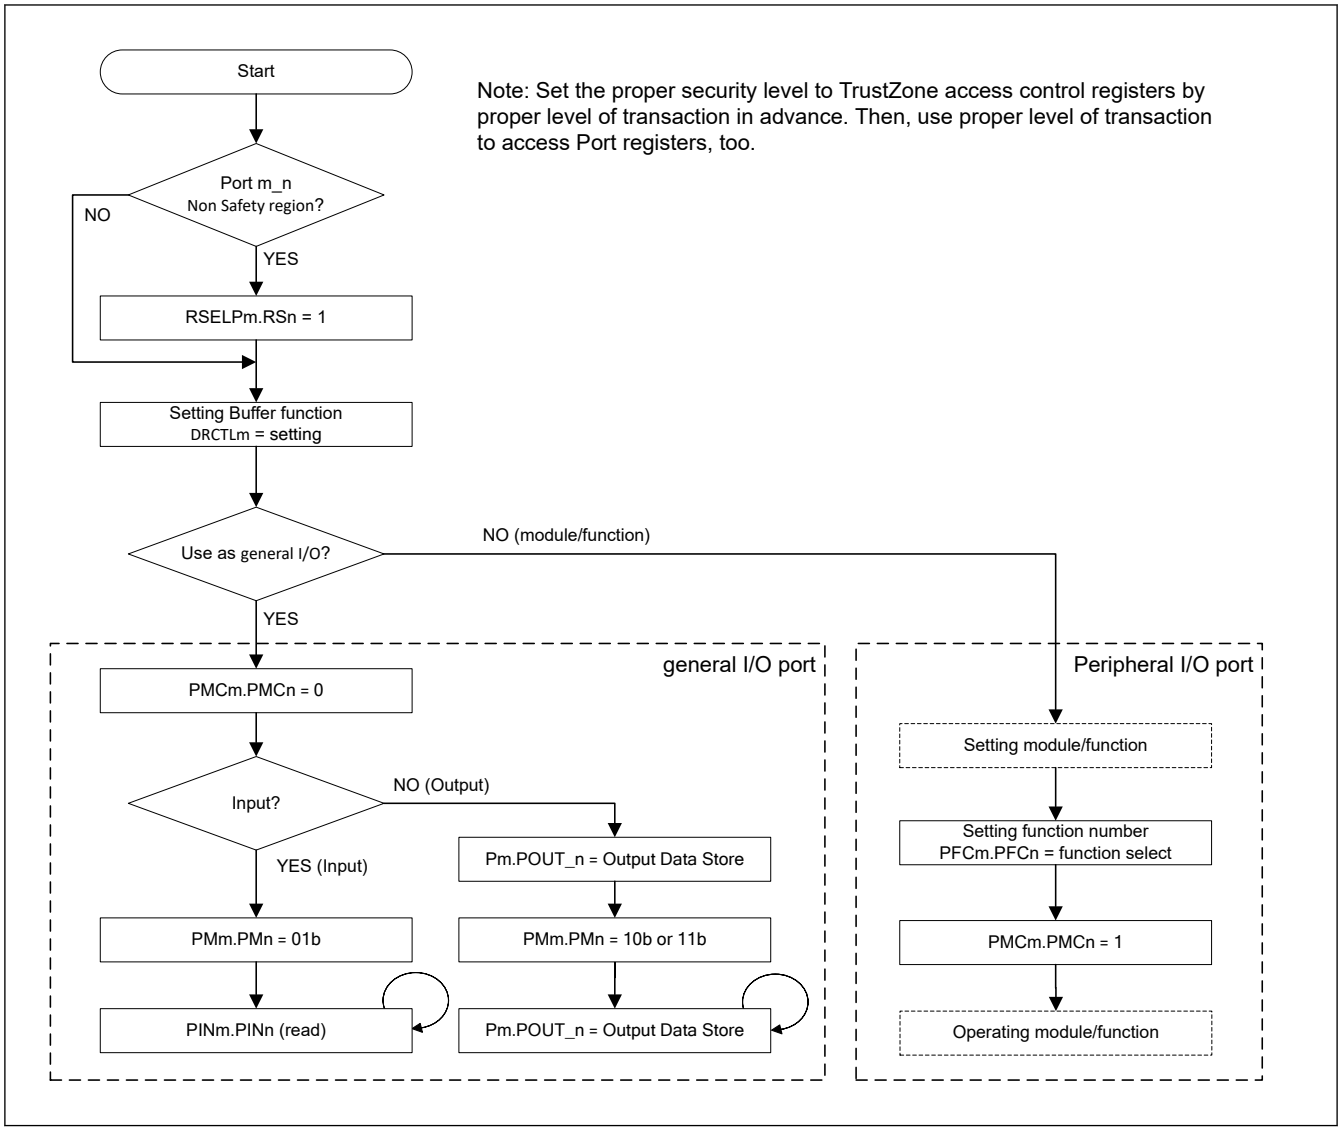

Figure 17.3 Example flow of Safety I/O port setting

17.7.5 Notes on Port Register Setting

1. If the multiplexed function is switched, a spike pulse may be generated in the signal of the on-chip peripheral function multiplexed with port due to the pin state immediately before the switching or other reasons. Take general measures shown below against spike pulses by software.
   - Switch the multiplexed function while the on-chip function is not working.
   - Clear the interrupt request flags, and then release the mask for pins multiplexed with interrupt signals.
   - Determine the output value, and then change the mode.
2. Only the allowed functions should be specified for the PFCm register. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
3. Do not assign a single function to multiple pins through the PFCm registers.

17.7.6 Pin Assignment of each Boot Mode

Functional pin is shared with multiple ports for flexibility of pin assignment. However, pins to be used at booting are uniquely determined each boot mode. These pin assignments are automatically set, and they can't be changed. PMCm and PFCm registers related to function pins at selected boot mode are changed from the initial values and stay after boot processing. If RESTORE_FLG is set to 0x2236_0679 in the boot parameter, these registers are changed back to the initial value after boot processing.

17.7.6.1 Pin Assignment for xSPI Boot Mode

Table 17.46 Pins to be used for xSPI boot mode

	xSPI0			xSPI1
Function pin	x1 boot	x8 boot	Function pin	x1 boot

18. Multi-Function Timer Pulse Unit 3 (MTU3)

18.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3), consisting of eight 16-bit timer channels and one 32-bit timer channel.

Table 18.1 shows the specifications of the MTU and Table 18.2 lists the functions of the MTU. Figure 18.1 and Figure 18.2 show block diagrams of the MTU.

Table 18.1 MTU specifications

Item	Description
Pulse input/output	28 lines maximum
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU1 and MTU2, 10 clocks for MTU5)
Operating frequency	PCLKH (250 MHz)
Available operations	[MTU0 to MTU4, MTU6, MTU7, MTU8] ● Waveform output on compare match ● Input capture function (noise filter setting available) ● Counter-clearing operation ● Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) ● Simultaneous clearing on compare match or input capture (excluding MTU8) ● Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) ● Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0, MTU3, MTU4, MTU6, MTU7, MTU8] ● Buffer operation specifiable
	[MTU1, MTU2] ● Phase counting mode can be specified independently ● 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1) ● Cascade connection operation available
	[MTU3, MTU4, MTU6, MTU7] ● Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation. ● In complementary PWM mode, transfer of values from buffer registers to temporary registers on crests and troughs of the timer-counter values or writing to the buffer registers (MTU4.TGRD and MTU7.TGRD) ● Double-buffering selectable in complementary PWM mode
	[MTU3, MTU4] ● Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU0/MTU5, MTU1, MTU2, MTU8] ● 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8
Interrupt skipping function	● In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low power consumption function	Module stop mode can be set

Table 18.2 MTU functions (1 of 3)

Module stop function	Module stop setting by the MSTPCRC.MSTPCRC00 bit									

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following an input from MTIOC1A or MTU0.TRGA compare match/input capture event. The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TRGC compare match/input capture event, or MTU8.TGRC compare match event.

Note 2. Capture in MTU8 is supported only in normal mode.

Table 18.6 MTU3 related system control register

Unit	Module Reset Control Register	Module Stop Control Register	Slave Access Control Register
0	—	MSTPCRC.MSTPCRC00	SLVACCCTL7.LLPP_SL*1

Note 1. Access from Cortex-R52 CPU0 and CPU1 is not protected by TrustZone. This slave access control is applied to access from other masters.

18.3 Register Descriptions

18.3.1 TCR : Timer Control Register

Base address: MTU0 = 0x9000_1300, MTU1 = 0x9000_1380, MTU2 = 0x9000_1400, MTU3 = 0x9000_1100
MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00, MTU8 = 0x9000_1600

Offset address: 0x000 (MTU0, MTU1, MTU2, MTU8), 0x100 (MTU3, MTU6), 0x001 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC[2:0]	Time Prescaler Select See section 18.3.3. TCR2 — Timer Control Registers.	R/W

Bit	Symbol	Function	R/W
4:3	CKEG[1:0]	Clock Edge Select 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges	R/W
7:5	CCLR[2:0]	Counter Clear Source Select See Table 18.7 and Table 18.8.	R/W

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. TCR values should be specified only while TCNT operation is stopped.

TPSC[2:0] bits (Time Prescaler Select)

These bits select the TCNT counter clock. The count clock source can be selected independently for each channel. For details, see section 18.3.3. TCR2 — Timer Control Registers.

CKEG[1:0] bits (Clock Edge Select)

The CKEG[1:0] bits select the input clock edge, including the MTIOC1A pin. When the input clock is counted at both edges, the input clock period is halved (e.g. PCLKH/4 at both edges = PCLKH/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is PCLKH/2 or slower. When PCLKH/1 or the overflow/underflow in another channel is selected for the input clock, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See Table 18.7 and Table 18.8 for details.

Table 18.7 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, MTU8)

Channel	Bit 7 CCLR[2]	Bit 6 CCLR[1]	Bit 5 CCLR[0]	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*2
	1	1	0	TCNT cleared by TGRD compare match/input capture*2
	1	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC or TSYRB.SYNC bit to 1 except for MTU8.
Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 18.8 CCLR[2:0] (MTU1 and MTU2)

Channel	Bit 7 Reserved*2	Bit 6 CCLR[1]	Bit 5 CCLR[0]	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC and TSYRB.SYNC bits to 1.
Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

18.3.2 TCRx : Timer Control Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x084 (TCRU)
0x094 (TCRV)
0x0A4 (TCRW)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TPSC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	TPSC[1:0]	Time Prescaler Select See Table 18.14.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

TPSC[1:0] bits (Time Prescaler Select)

The TPSC[1:0] bits select the TCNT counter clock. For details, see Table 18.14.

18.3.3 TCR2 — Timer Control Registers

18.3.3.1 MTU0.TCR2 : Timer Control Register 2

Base address: MTU0 = 0x9000_1300

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.9.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. For details, see Table 18.9.

Table 18.9 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU0)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU0	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	External clock: counts on MTCLKC pin input
	0	0	0	1	1	1	External clock: counts on MTCLKD pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/256
	1	0	1	x	x	x	Internal clock: counts on PCLKH/1024
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	External clock: counts on MTIOC1A pin input

18.3.3.2 MTU1.TCR2 : Timer Control Register 2

Base address: MTU1 = 0x9000_1380

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.10.	R/W
4:3	PCB[1:0]	Functional Expansion Control for Phase Counting Modes 2, 3, and 5 Controls expansion of functionality to modes 2, 3, and 5 of phase-counting mode	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. For details, see Table 18.10.

PCB[1:0] bits (Functional Expansion Control for Phase Counting Modes 2, 3, and 5)

The PCB[1:0] bits control extended functions for phase counting modes 2, 3, and 5 in MTU1 and MTU2. For details, see section 18.4.6. Phase Counting Mode.

Table 18.10 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU1)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU1	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	Internal clock: counts on PCLKH/256
	0	0	0	1	1	1	Overflow/underflow of MTU2.TCNT
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/1024
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

Note: This setting has no effect when MTU1 is in phase counting mode.

18.3.3.3 MTU2.TCR2 : Timer Control Register 2

Base address: MTU2 = 0x9000_1400

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.11.	R/W
4:3	PCB[1:0]	Functional Expansion Control for Phase Counting Modes 2, 3, and 5 Controls expansion of functionality to modes 2, 3, and 5 of phase-counting mode.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 18.11 for details.

PCB[1:0] bits (Functional Expansion Control for Phase Counting Modes 2, 3, and 5)

The PCB[1:0] bits control extended functions for phase counting modes 2, 3, and 5 in MTU1 and MTU2. See section 18.4.6. Phase Counting Mode for details.

Table 18.11 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU2)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU2	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	External clock: counts on MTCLKC pin input
	0	0	0	1	1	1	Internal clock: counts on PCLKH/1024
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/256
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

Note: This setting has no effect when the MTU2 is in phase counting mode.

18.3.3.4 MTUm.TCR2 : Timer Control Register 2 (m = 3, 4, 6, 7)

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x4D (MTU4, MTU7)
0x14C (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.12.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 18.12 for details.

Table 18.12 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU3, MTU4, MTU6, MTU7)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU3 MTU4 MTU6 MTU7	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	Internal clock: counts on PCLKH/256
	0	0	0	1	0	1	Internal clock: counts on PCLKH/1024
	0	0	0	1	1	0	External clock: counts on MTCLKA pin input
	0	0	0	1	1	1	External clock: counts on MTCLKB pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2

18.3.3.5 MTU8.TCR2 : Timer Control Register 2

Base address: MTU8 = 0x9000_1600

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.12.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 18.12 for details.

Table 18.13 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU8)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU8	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	Internal clock: counts on PCLKH/256
	0	0	0	1	0	1	Internal clock: counts on PCLKH/1024
	0	0	0	1	1	0	External clock: counts on MTCLKA pin input
	0	0	0	1	1	1	External clock: counts on MTCLKB pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Setting prohibited
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

18.3.3.6 MTU5.TCR2x : Timer Control Register 2x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x85 (TCR2U)
0x95 (TCR2V)
0xA5 (TCR2W)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CKEG[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 18.14.	R/W
4:3	CKEG[1:0]	Clock Edge Select 0 0: Counts at the rising edge 0 1: Counts at the falling edge 1 x: Counts at both edges	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. See Table 18.14 for details.

CKEG[1:0] bits (Clock Edge Select)

The CKEG[1:0] bits select the edge of the count clock signal input from the MTIOC1A pin.

Table 18.14 TPSC[1:0], CKEG[1:0], TPSC2[2:0] (MTU5)

Channel	TCR2 register					TCR register		Description
	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 1	Bit 0	
	CKEG[1]	CKEG[0]	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[1]	TPSC[0]	
MTU5	x	x	0	0	0	0	0	Internal clock: counts on PCLKH/1
	x	x	0	0	0	0	1	Internal clock: counts on PCLKH/4
	x	x	0	0	0	1	0	Internal clock: counts on PCLKH/16
	x	x	0	0	0	1	1	Internal clock: counts on PCLKH/64
	x	x	0	0	1	x	x	Internal clock: counts on PCLKH/2
	x	x	0	1	0	x	x	Internal clock: counts on PCLKH/8
	x	x	0	1	1	x	x	Internal clock: counts on PCLKH/32
	x	x	1	0	0	x	x	Internal clock: counts on PCLKH/256
	x	x	1	0	1	x	x	Internal clock: counts on PCLKH/1024
	x	x	1	1	0	x	x	Setting prohibited
	0	0	1	1	1	x	x	Counts at the rising edge on MTIOC1A pin input
	0	1	1	1	1	x	x	Counts at the falling edge on MTIOC1A pin input
	1	x	1	1	1	x	x	Counts at the both edges on MTIOC1A pin input

Note: Bits 7 to 2 in the TCR register are reserved for MTU5. These bits are read as 0. The write value should be 0.

18.3.4 TMDR1 : Timer Mode Register 1

Base address: MTU0 = 0x9000_1300

Offset address: 0x001

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BFE	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x001

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00
MTU8 = 0x9000_1600

Offset address: 0x102 (MTU3, MTU6), 0x003 (MTU4, MTU7), 0x001 (MTU8)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	MD[3:0]	Mode Select These bits specify the timer operating mode. See Table 18.15 for details.	R/W

Bit	Symbol	Function	R/W
4	BFA	Buffer Operation A 0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation	R/W
5	BFB	Buffer Operation B 0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation	R/W
6	BFE	Buffer Operation E 0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

MD[3:0] bits (Mode Select)

Table 18.15 Operating mode setting by MD[3:0] bits (MTU0 to MTU4 and MTU6 to MTU8)

MD[3]	MD[2]	MD[1]	MD[0]	Description	MTU0	MTU1	MTU2	MTU3	MTU4	MTU6	MTU7	MTU8
0	0	0	0	Normal mode	✓	✓	✓	✓	✓	✓	✓	✓
0	0	0	1	Setting prohibited								
0	0	1	0	PWM mode 1	✓	✓	✓	✓	✓	✓	✓	
0	0	1	1	PWM mode 2	✓	✓	✓					
0	1	0	0	Phase counting mode 1		✓	✓					
0	1	0	1	Phase counting mode 2		✓	✓					
0	1	1	0	Phase counting mode 3		✓	✓					
0	1	1	1	Phase counting mode 4		✓	✓					
1	0	0	0	Reset-synchronized PWM mode*1				✓		✓		
1	0	0	1	Phase counting mode 5		✓	✓					
1	0	1	0	Setting prohibited								
1	0	1	1	Setting prohibited								
1	1	0	0	Setting prohibited								
1	1	0	1	Complementary PWM mode 1 (transfer at crest)*1				✓		✓		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*1				✓		✓		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*1				✓		✓		

Note: Only set the corresponding operating mode listed above for each channel.
Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

BFA bit (Buffer Operation A)

The BFA bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in a mode other than complementary PWM mode, but TGRC compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIEC bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode, buffer operation in MTU3 and MTU4 (MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1. The BFA bit of MTU4.TMDR1 should be set to 0. In complementary PWM mode, buffer

operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the BFA bit setting in MTU3.TMDR1 (MTU6.TMDR1). Set the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 18.50.

BFB bit (Buffer Operation B)

The BFB bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not usually take place, but TGRD compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIED bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode, buffer operation in MTU3 and MTU4 (MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1. The BFB bit of MTU4.TMDR1 should be set to 0. In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the BFB bit setting in MTU3.TMDR1 (MTU6.TMDR1). Set the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 18.50.

BFE bit (Buffer Operation E)

The BFE bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. TGRF compare match takes place even when TGRF is used as a buffer register.

In MTU1 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

18.3.5 TMDR2x : Timer Mode Register 2x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x270 (TMDR2A)
0xA70 (TMDR2B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DRS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DRS	Double Buffer Select 0: Double buffer function is disabled 1: Double buffer function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, and one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

DRS bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

18.3.6 TMDR3 : Timer Mode Register 3

Base address: MTU1 = 0x9000_1380

Offset address: 0x011

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PHCK SEL	LWA
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	LWA	MTU1/MTU2 Combination Longword Access Control 0: 16-bit access is enabled. 1: 32-bit access is enabled.	R/W
1	PHCKSEL	External Input Phase Clock Select Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

The TMDR3 register controls access in longword units to the combination of MTU1 and MTU2, and there is only one register, which is in MTU1. Such access can proceed when the LWA bit is set in the ways listed in Table 18.16.

LWA bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in combination of MTU1 and MTU2. Set this bit only in 32-bit phase counting mode.

When LWA is set to 0, the MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers cannot be accessed. These bits are read as 0x00000000.

When LWA is set to 1, the MTU1.TCNT, MTU2.TCNT, MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers cannot be accessed. These bits are read as 0x0000.

The settings of the control registers (TCR, TCR2, TIOR, and TMDR1) in MTU1 take priority because MTU1 and MTU2 operates together while LWA = 1.

In this case, the settings of the control registers in MTU2 are ignored. Furthermore, MTU2 input capture and compare match are disabled, which in turn disables any linked operation with the ELC.

The cascaded connection of MTU1 and MTU2 with the LWA bit set to 1 can only be used in phase counting mode, but not in normal mode, PWM mode 1, or PWM mode 2. Select phase counting mode when LWA = 1.

Initialize the counters and general registers in MTU1 and MTU2 prior to rewriting to the LWA bit.

PHCKSEL bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects the external input clock pin on which A- or B-phase signal is to be input. See Table 18.63 for details.

Table 18.16 Setting and combination of the TMDR3 register

Register	TMDR3.LWA = 0		TMDR3.LWA = 1	
	Symbol	Access mode	Symbol	Access mode
Counter in MTU1*1	MTU1.TCNT	Word	MTU1.TCNTLW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRALW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRBLW	Longword
General register B in MTU2	MTU2.TGRB	Word		

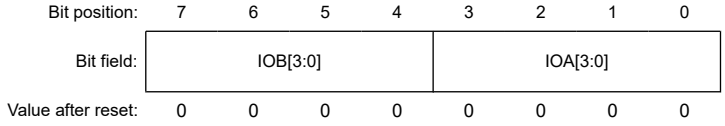
Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

18.3.7 TIOR — Timer I/O Control Registers

18.3.7.1 MTUm.TIOR : Timer I/O Control Register (m = 1, 2)

Base address: MTU1 = 0x9000_1380
MTU2 = 0x9000_1400

Offset address: 0x002



Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 For MTU1, see Table 18.17. For MTU2, see Table 18.19.	R/W
7:4	IOB[3:0]	I/O Control B*1 For MTU1, see Table 18.18. For MTU2, see Table 18.20.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIOR register controls the TGR register. The TIOR register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIOR is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIOR is affected by the TMDR1 setting.

Table 18.17 IOA[3:0] bits enumerated value and function for MTU1

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC1A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Input capture at generation of MTU0.TGRA compare match/ input capture.

Table 18.18 IOB[3:0] bits enumerated value and function for MTU1

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC1B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Input capture at occurrence of compare match or input capture in the MTU0.TGRC register
1	1	1	x		Input capture at occurrence of compare match or input capture in the MTU8.TGRC register

Table 18.19 IOA[3:0] bits enumerated value and function for MTU2

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC2A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.20 IOB[3:0] bits enumerated value and function for MTU2 (1 of 2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC2B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.

Table 18.20 IOB[3:0] bits enumerated value and function for MTU2 (2 of 2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC2B pin function
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

18.3.7.2 MTU0.TIORH : Timer I/O Control Register H

Base address: MTU0 = 0x9000_1300

Offset address: 0x002

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.21.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.22.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 18.21 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC0A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*1
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

Note 1. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

Table 18.22 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC0B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*1

Note 1. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

18.3.7.3 MTU3.TIORH : Timer I/O Control Register H

Base address: MTU3 = 0x9000_1100

Offset address: 0x104

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.23.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.24.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 18.23 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC3A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.24 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC3B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

18.3.7.4 MTU4.TIORH : Timer I/O Control Register H

Base address: MTU4 = 0x9000_1200

Offset address: 0x006

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.25.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.26.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 18.25 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC4A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.26 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC4B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

18.3.7.5 MTU6.TIORH : Timer I/O Control Register H

Base address: MTU6 = 0x9000_1900

Offset address: 0x104

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.27.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.28.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 18.27 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC6A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.28 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC6B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

18.3.7.6 MTU7.TIORH : Timer I/O Control Register H

Base address: MTU7 = 0x9000_1A00

Offset address: 0x006

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.29.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.30.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC7A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.30 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC7B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

18.3.7.7 MTU8.TIORH : Timer I/O Control Register H

Base address: MTU8 = 0x9000_1600

Offset address: 0x002

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 18.31.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 18.32.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 18.31 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC8A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 18.32 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC8B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).

18.3.7.8 MTU0.TIORL : Timer I/O Control Register L

Base address: MTU0 = 0x9000_1300

Offset address: 0x003

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.33.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.34.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.33 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC0C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*2

Note 1. When the MTU0.TMDR1.BFA bit is set to 1 and MTU0.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.
Note 2. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

Table 18.34 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC0D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*2

Note 1. When the MTU0.TMDR1.BFB bit is set to 1 and MTU0.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.
Note 2. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

18.3.7.9 MTU3.TIORL : Timer I/O Control Register L

Base address: MTU3 = 0x9000_1100

Offset address: 0x105

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.35.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.36.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.35 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC3C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU3.TMDR1.BFA bit is set to 1 and MTU3.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 18.36 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC3D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU3.TMDR1.BFB bit is set to 1 and MTU3.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

18.3.7.10 MTU4.TIORL : Timer I/O Control Register L

Base address: MTU4 = 0x9000_1200

Offset address: 0x007

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.37.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.38.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.37 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC4C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU4.TMDR1.BFB bit is set to 1 and MTU4.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 18.38 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC4D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU4.TMDR1.BFB bit is set to 1 and MTU4.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

18.3.7.11 MTU6.TIORL : Timer I/O Control Register L

Base address: MTU6 = 0x9000_1900

Offset address: 0x105

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.39.	R/W

Bit	Symbol	Function	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.40.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.39 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC6C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU6.TMDR1.BFA bit is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 18.40 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC6D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU6.TMDR1.BFB bit is set to 1 and MTU6.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

18.3.7.12 MTU7.TIORL : Timer I/O Control Register L

Base address: MTU7 = 0x9000_1A00

Offset address: 0x007

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.41.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.42.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.41 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC7C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU7.TMDR1.BFA bit is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 18.42 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC7D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU7.TMDR1.BFB bit is set to 1 and MTU7.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

18.3.7.13 MTU8.TIORL : Timer I/O Control Register L

Base address: MTU8 = 0x9000_1600

Offset address: 0x003

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 18.43.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 18.44.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 18.43 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC8C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 18.44 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC8D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU8.TMDR1.BFB bit is set to 1 and MTU8.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

18.3.7.14 MTU5.TIORx : Timer I/O Control Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x086 (TIORU)
0x096 (TIORV)
0x0A6 (TIORW)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	IOC[4:0]				
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	IOC[4:0]	I/O Control C For details, see Table 18.45.	R/W

Bit	Symbol	Function	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TIORx register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORx is valid when the counter is stopped (the CST5 bit in TSTR is set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORx is affected by the TMDR1 setting.

Table 18.45 IOC[4:0] bits enumerated value and function for MTU5

Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[4]	IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRU, TGRV, TGRW register function	MTIC5U, MTIC5V, MTIC5W pin function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

18.3.8 TCNTCMPCLR : Timer Compare Match Clear Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CMPCLR5W	TCNT Compare Clear 5W 0: Disables MTU5.TCNTW to be cleared to 0x0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to 0x0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture	R/W
1	CMPCLR5V	TCNT Compare Clear 5V 0: Disables MTU5.TCNTV to be cleared to 0x0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to 0x0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture	R/W
2	CMPCLR5U	TCNT Compare Clear 5U 0: Disables MTU5.TCNTU to be cleared to 0x0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to 0x0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

18.3.9 TIER — Timer Interrupt Enable Registers

18.3.9.1 MTUm.TIER : Timer Interrupt Enable Register (m = 0 to 4, 6 to 8)

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x004 (MTU1, MTU2)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU0 = 0x9000_1300, MTU3 = 0x9000_1100, MTU6 = 0x9000_1900

Offset address: 0x004 (MTU0), 0x108 (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x009 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU8 = 0x9000_1600

Offset address: 0x004 (MTU8)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGIEA	TGR Interrupt Enable A 0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled	R/W
1	TGIEB	TGR Interrupt Enable B 0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled	R/W
2	TGIEC	TGR Interrupt Enable C 0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled	R/W
3	TGIED	TGR Interrupt Enable D 0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled	R/W
4	TCIEV	Overflow Interrupt Enable 0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled	R/W
5	TCIEU	Underflow Interrupt Enable 0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled	R/W
6	TTGE2	A/D Converter Start Request Enable 2 0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled	R/W
7	TTGE	A/D Converter Start Request Enable 0: A/D converter start request generation disabled 1: A/D converter start request generation enabled	R/W

Note: n = 4 or 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

TGIEA and TGIEB bits (TGR Interrupt Enable A and TGR Interrupt Enable B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

TGIEC and TGIED bits (TGR Interrupt Enable C and TGR Interrupt Enable D)

Each bit enables or disables interrupt requests (TGIn) (n = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

TCIEV bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

TCIEU bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE2 bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4 or 7).

In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match.

MTU8 is a reserved bit. It is read as 0. The write value should be 0.

18.3.9.2 MTU0.TIER2 : Timer Interrupt Enable Register 2

Base address: MTU0 = 0x9000_1300

Offset address: 0x024

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGIEE	TGR Interrupt Enable E 0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled	R/W
1	TGIEF	TGR Interrupt Enable F 0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled	R/W
6:2	—	The read values are undefined. The write value should be 0.	R/W
7	TTGE2	A/D Converter Start Request Enable 2 0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled	R/W

TGIEE bit (TGR Interrupt Enable E)

The TGIEE bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRE.

TGIEF bit (TGR Interrupt Enable F)

The TGIEF bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRF.

TTGE2 bit (A/D Converter Start Request Enable 2)

The TTGE2 bit enables or disables A/D converter start requests by compare match between MTU0.TCNT and MTU0.TGRE.

18.3.9.3 MTU5.TIER : Timer Interrupt Enable Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	TGIE5W	TGR Interrupt Enable 5W 0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled	R/W
1	TGIE5V	TGR Interrupt Enable 5V 0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled	R/W
2	TGIE5U	TGR Interrupt Enable 5U 0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TGIE5x bits (TGR Interrupt Enable 5x)

Each bit enables or disables interrupt requests (TGIx5) (x = U, V, W).

18.3.10 TSR : Timer Status Register

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400
MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x005 (MTU1, MTU2), 0x02D (MTU4, MTU7), 0x12C (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCFD	—	TCFU	TCFV	TGFD	TGFC	TGFB	TGFA
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGFA	Input Capture/Output Compare Flag A 0: TGRA input capture or compare match has not occurred 1: TGRA input capture or compare match has occurred	R/W*1
1	TGFB	Input Capture/Output Compare Flag B 0: TGRB input capture or compare match has not occurred 1: TGRB input capture or compare match has occurred	R/W*1
2	TGFC	Input Capture/Output Compare Flag C 0: TGRC input capture or compare match has not occurred 1: TGRC input capture or compare match has occurred	R/W*1
3	TGFD	Input Capture/Output Compare Flag D 0: TGRD input capture or compare match has not occurred 1: TGRD input capture or compare match has occurred	R/W*1
4	TCFV	Overflow flag 0: TCNT overflow has not occurred 1: TCNT overflow has occurred	R/W*1
5	TCFU	Underflow flag 0: TCNT underflow has not occurred when MTU1 and MTU2 are in phase counting mode 1: TCNT underflow has occurred when MTU1 and MTU2 are in phase counting mode	R/W*1
6	—	This bit is read as 1. The write value should be 1.	R/W
7	TCFD	Count Direction Flag 0: TCNT counts down 1: TCNT counts up	R

Note 1. Only writing 0 to this bit after reading 1 from this bit in order to clear the flag is possible. After 1 is read from this bit, if the next flag is set before 0 is written to this bit, writing 0 to this bit does not clear the flag. In this case, read 1 again from this bit, and then write 0 to this bit.

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

TGFA flag (Input Capture/Output Compare Flag A)

The TGFA flag indicates generation of TGRA input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFA = 1, the TGFA flag is read, and then 0 is written to the TGFA flag.

[Setting conditions]

- TCNT = TGRA when the TGRA register functions as an output compare register.
- The value of TCNT is transferred to TGRA due to the input capture signal when the TGRA register functions as an input capture register.

TGFB flag (Input Capture/Output Compare Flag B)

The TGFB flag indicates generation of TGRB input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFB = 1, the TGFB flag is read, and then 0 is written to the TGFB flag.

[Setting conditions]

- TCNT = TGRB when the TGRB register functions as an output compare register.
- The value of TCNT is transferred to the TGRB register due to the input capture signal when the TGRB register functions as an input capture register.

TGFC flag (Input Capture/Output Compare Flag C)

The TGFC flag indicates generation of TGRC input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFC = 1, the TGFC flag is read, and then 0 is written to the TGFC flag.

[Setting conditions]

- TCNT = TGRC when the TGRC register functions as an output compare register.
- The value of TCNT is transferred to the TGRC register due to the input capture signal when the TGRC register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TGFD flag (Input Capture/Output Compare Flag D)

The TGFD flag indicates generation of TGRD input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFD = 1, the TGFD flag is read, and then 0 is written to the TGFD flag.

[Setting conditions]

- TCNT = TGRD when the TGRD register functions as the output compare register.
- The value of TCNT is transferred to the TGRD register due to the input capture signal when the TGRD register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TCFV flag (Overflow flag)

The TCFV flag indicates generation of TCNT overflow. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFV = 1, the TCFV flag is read, and then 0 is written to the TCFV flag.

[Setting conditions]

- The value of TCNT overflows (changed from 0xFFFF to 0x0000).

For MTU4 or MTU7, the TCFV flag is also set to 1 when the value of TCNT of MTU4 or MTU7 underflows (changed from 0x0001 to 0x0000) in complementary PWM mode.

TCFU flag (Underflow flag)

The TCFU flag indicates generation of TCNT underflow when MTU1 and MTU2 are in phase counting mode. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFU = 1, TCFU is read, and then 0 is written to TCFU.

[Setting conditions]

- The value of TCNT underflows (changed from 0x0000 to 0xFFFF).

This bit is reserved for MTU3, MTU4, MTU6, and MTU7. This bit is read as 0. The write value should be 0.

TCFD flag (Count Direction Flag)

The TCFD flag indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

18.3.11 TBTM : Timer Buffer Operation Transfer Mode Register

Base address: MTU0 = 0x9000_1300

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TTSE	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x138 (MTU3, MTU6), 0x039 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TTSA	Timing Select A 0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA	R/W
1	TTSB	Timing Select B 0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB	R/W
2	TTSE	Timing Select E 0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE	R/W
7:37:2	—	These bits are read as 0. The write value should be 0.	R/W

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

TTSA bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

18.3.12 TICCR : Timer Input Capture Control Register

Base address: MTU1 = 0x9000_1380

Offset address: 0x010

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	I1AE	Input Capture Enable 0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions	R/W
1	I1BE	Input Capture Enable 0: Does not include the MTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions	R/W
2	I2AE	Input Capture Enable 0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions	R/W
3	I2BE	Input Capture Enable 0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

18.3.13 TSYCR : Timer Synchronous Clear Register

Base address: MTU6 = 0x9000_1900

Offset address: 0x150

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CE2B	Clear Enable 2B 0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.	R/W
1	CE2A	Clear Enable 2A 0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing.*1 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing.*1	R/W
2	CE1B	Clear Enable 1B 0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing.*1 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing.*1	R/W

Bit	Symbol	Function	R/W
3	CE1A	Clear Enable 1A 0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing.*1 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing.*1	R/W
4	CE0D	Clear Enable 0D 0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing.*1	R/W
5	CE0C	Clear Enable 0C 0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing.*1	R/W
6	CE0B	Clear Enable 0B 0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing.*1	R/W
7	CE0A	Clear Enable 0A 0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing.*1	R/W

Note 1. This does not depend on the MTUn.TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU6.

18.3.14 TCNT — Timer Counters

18.3.14.1 MTUn.TCNT : Timer Counter (n = 0 to 4, 6, 7)

Base address: MTU0 = 0x9000_1300, MTU1 = 0x9000_1380, MTU2 = 0x9000_1400, MTU3 = 0x9000_1100
MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x006 (MTU0, MTU1, MTU2), 0x110 (MTU3, MTU6), 0x012 (MTU4, MTU7)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15	n/a	Timer Counter	R/W

Note: The TCNT counters should be accessed in 16-bit units.

18.3.14.2 MTU5.TCNTx : Timer Counter x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x080 (TCNTU)
0x090 (TCNTV)
0x0A0 (TCNTW)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

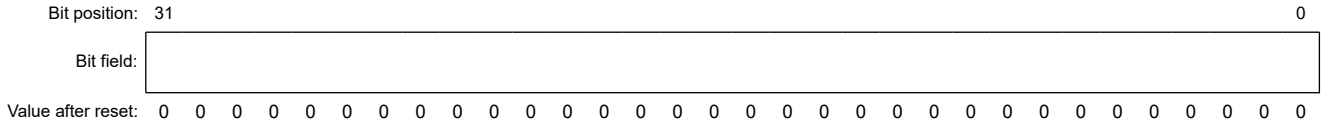
Bit	Symbol	Function	R/W
15	n/a	Timer Counter	R/W

Note: The TCNT counters should be accessed in 16-bit units.

18.3.14.3 MTU8.TCNT : Timer Counter

Base address: MTU8 = 0x9000_1600

Offset address: 0x008



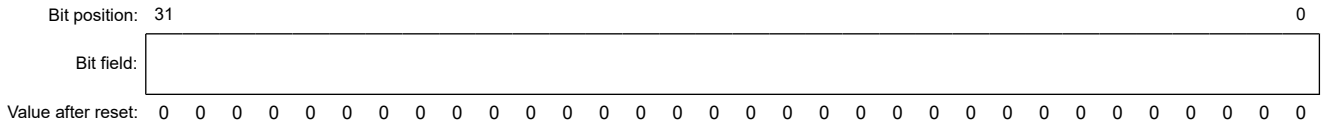
Bit	Symbol	Function	R/W
31:0	n/a	Timer Counter	R/W

Note: The TCNT counters should be accessed in 32-bit units.

18.3.15 TCNTLW : Timer Longword Counter

Base address: MTU1 = 0x9000_1380

Offset address: 0x020



Bit	Symbol	Function	R/W
31:0	n/a	The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA = 1. The TCNTLW counter is initialized to 0x00000000 by a reset. See section 18.3.6. TMDR3 : Timer Mode Register 3 for details. This register can only be used in 32-bit phase counting mode.	R/W

18.3.16 TGR — Timer General Registers

18.3.16.1 MTU0.TGRx : Timer General Register x (x = A, B, C, D, E, F)

Base address: MTU0 = 0x9000_1300

Offset address: 0x008 (TGRA), 0x00A (TGRB), 0x00C (TGRC), 0x00E (TGRD), 0x020 (TGRE), 0x022 (TGRF)

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD. TGRE and TGRF function as compare registers. When the MTU0.TCNT count matches the TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF.	R/W

Note: TGR should be accessed in 16-bit units.

18.3.16.2 MTU1/2.TGRx : Timer General Register x (x = A, B)

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x008 (TGRA), 0x00A (TGRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA and TGRB registers function as either output compare or input capture registers. The TGRA and TGRB registers are read as 0x0000 when TMDR3.LWA = 1. For details, see section 18.3.6. TMDR3 : Timer Mode Register 3.	R/W

Note: TGR should be accessed in 16-bit units.

18.3.16.3 MTU3/6.TGRx : Timer General Register x (x = A, B, C, D, E)

Base address: MTU3 = 0x9000_1100, MTU6 = 0x9000_1900

Offset address: 0x118 (TGRA), 0x11A (TGRB), 0x124 (TGRC), 0x126 (TGRD), 0x172 (TGRE)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU3 and MTU6 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 16-bit units.

18.3.16.4 MTU4/7.TGRx : Timer General Register x (x = A, B, C, D, E, F)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x01C (TGRA), 0x01E (TGRB), 0x028 (TGRC), 0x02A (TGRD), 0x074 (TGRE), 0x076 (TGRF)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

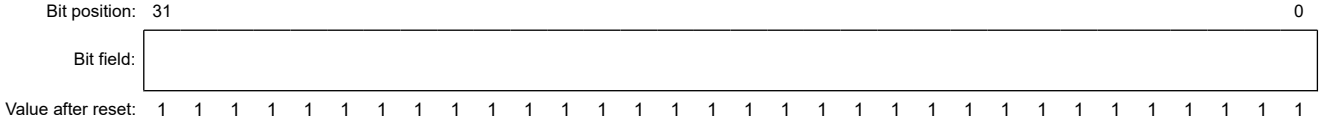
Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU4 and MTU7 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 16-bit units.

18.3.16.5 MTU8.TGRx : Timer General Register x (x = A, B, C, D)

Base address: MTU8 = 0x9000_1600

Offset address: 0x00C (TGRA), 0x010 (TGRB), 0x014 (TGRC), 0x018 (TGRD)



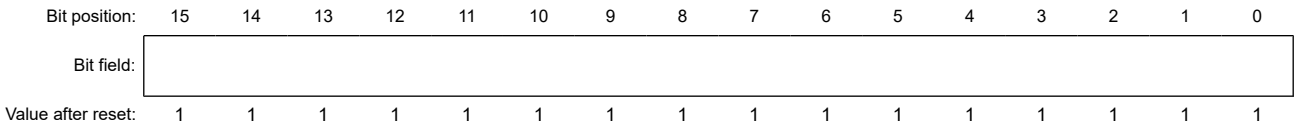
Bit	Symbol	Function	R/W
31:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 32-bit units.

18.3.16.6 MTU5.TGRx : Timer General Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x082 (TGRU), 0x092 (TGRV), 0x0A2 (TGRW)



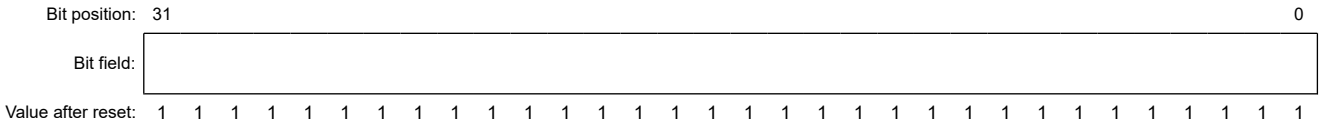
Bit	Symbol	Function	R/W
15:0	n/a	MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.	R/W

Note: TGR should be accessed in 16-bit units.

18.3.17 TGRxLW : Timer Longword General Register x (x = A, B)

Base address: MTU1 = 0x9000_1380

Offset address: 0x024 (TGRALW)
0x028 (TGRBLW)



Bit	Symbol	Function	R/W
31:0	n/a	The TGRnLW register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining MTU1.TGRn and MTU2.TGRn. Such operation is only effective when TMDR3.LWA = 1. See section 18.3.6. TMDR3 : Timer Mode Register 3 for details. The TGRnLW register functions as an output compare or input capture register when TMDR3.LWA = 1. This register can only be used in 32-bit phase counting mode.	R/W

18.3.18 TSTR — Timer Start Registers

18.3.18.1 TSTRA : Timer Start Register A

Base address: MTU = 0x9000_1000

Offset address: 0x280

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CST0	Counter Start 0 0: MTU0.TCNT counting is stopped 1: MTU0.TCNT performs count operation	R/W
1	CST1	Counter Start 1 0: MTU1.TCNT counting is stopped 1: MTU1.TCNT performs count operation	R/W
2	CST2	Counter Start 2 0: MTU2.TCNT counting is stopped 1: MTU2.TCNT performs count operation	R/W
3	CST8	Counter Start 8 0: MTU8.TCNT counting is stopped 1: MTU8.TCNT performs count operation	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	CST3	Counter Start 3 0: MTU3.TCNT counting is stopped 1: MTU3.TCNT performs count operation	R/W
7	CST4	Counter Start 4 0: MTU4.TCNT counting is stopped 1: MTU4.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

CSTn bits (Counter Start n (n = 0 to 4, 8))

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time the MTIOC pin outputs the initial output level set in the TOCR1A or TOCR2A register in complementary PWM mode or reset-synchronized PWM mode, but the output compare signal level from the MTIOC pin is retained in the other modes. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

18.3.18.2 TSTRB : Timer Start Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA80

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CST7	CST6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	CST6	Counter Start 6 0: MTU6.TCNT counting is stopped 1: MTU6.TCNT performs count operation	R/W
7	CST7	Counter Start 7 0: MTU7.TCNT counting is stopped 1: MTU7.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn bits (Counter Start n (n = 6, 7))

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time the MTIOC pin outputs the initial output level set in the TOCR1B or TOCR2B register in complementary PWM mode or reset-synchronized PWM mode, but the output compare signal level from the MTIOC pin is retained in the other modes. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

18.3.18.3 MTU5.TSTR : Timer Start Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CSTW5	Counter Start W5 0: MTU5.TCNTW counting is stopped 1: MTU5.TCNTW performs count operation	R/W
1	CSTV5	Counter Start V5 0: MTU5.TCNTV counting is stopped 1: MTU5.TCNTV performs count operation	R/W
2	CSTU5	Counter Start U5 0: MTU5.TCNTU counting is stopped 1: MTU5.TCNTU performs count operation	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

18.3.19 TSYRA : Timer Synchronous Register A

Base address: MTU = 0x9000_1000

Offset address: 0x281

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SYNC0	Timer Synchronous Operation 0 0: MTU0.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

Bit	Symbol	Function	R/W
1	SYNC1	Timer Synchronous Operation 1 0: MTU1.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
2	SYNC2	Timer Synchronous Operation 2 0: MTU2.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	SYNC3	Timer Synchronous Operation 3 0: MTU3.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
7	SYNC4	Timer Synchronous Operation 4 0: MTU4.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4. A channel performs synchronous operation when the corresponding bit in TSYRA is set to 1.

SYNCn bits (Timer Synchronous Operation n)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible. To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

18.3.20 TSYRB : Timer Synchronous Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA81

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SYNC 7	SYNC 6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	SYNC6	Timer Synchronous Operation 6 0: MTU6.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
7	SYNC7	Timer Synchronous Operation 7 0: MTU7.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7. A channel performs synchronous operation when the corresponding bit in TSYRB is set to 1.

SYNCn bits (Timer Synchronous Operation n)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible. To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

18.3.21 TCSYSTR : Timer Counter Synchronous Start Register

Base address: MTU = 0x9000_1000

Offset address: 0x282

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SCH7	Synchronous Start 7 0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT	R/W*1
1	SCH6	Synchronous Start 6 0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT	R/W*1
2	—	This bit is read as 0. The write value should be 0.	R/W
3	SCH4	Synchronous Start 4 0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT	R/W*1
4	SCH3	Synchronous Start 3 0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT	R/W*1
5	SCH2	Synchronous Start 2 0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT	R/W*1
6	SCH1	Synchronous Start 1 0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT	R/W*1
7	SCH0	Synchronous Start 0 0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT	R/W*1

Note 1. Only 1 can be written to this bit, and doing so sets the register. TCSYSTR is automatically cleared to 0 after 1 is written to.

TCSYSTR specifies synchronous start of the counters.

SCH7 bit (Synchronous Start 7)

This bit controls synchronous start of MTU7.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST7 bit while SCH7 = 1

SCH6 bit (Synchronous Start 6)

This bit controls synchronous start of MTU6.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST6 bit while SCH6 = 1

SCH4 bit (Synchronous Start 4)

This bit controls synchronous start of MTU4.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST4 bit while SCH4 = 1

SCH3 bit (Synchronous Start 3)

This bit controls synchronous start of MTU3.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST3 bit while SCH3 = 1

SCH2 bit (Synchronous Start 2)

This bit controls synchronous start of MTU2.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST2 bit while SCH2 = 1

SCH1 bit (Synchronous Start 1)

This bit controls synchronous start of MTU1.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST1 bit while SCH1 = 1

SCH0 bit (Synchronous Start 0)

This bit controls synchronous start of MTU0.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST0 bit while SCH0 = 1

18.3.22 TRWERx : Timer Read/Write Enable Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x284 (TRWERA)
0xA84 (TRWERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RWE
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	RWE	Read/Write Enable 0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

RWE bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.

[Clearing condition]

- When 0 is written to the RWE bit after reading RWE = 1

Note:
- **Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)** 24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, and MTUn.TCNT (n = 3, 4)
- **Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)** 23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTUn.MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, MTU.TDDRB, and MTUn.TCNT (n = 6, 7)

18.3.23 TOERA : Timer Output Master Enable Register A

Base address: MTU = 0x9000_1000

Offset address: 0x20A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OE3B	Master Enable MTIOC3B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
1	OE4A	Master Enable MTIOC4A 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
2	OE4B	Master Enable MTIOC4B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
3	OE3D	Master Enable MTIOC3D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
4	OE4C	Master Enable MTIOC4C 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
5	OE4D	Master Enable MTIOC4D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
7:6	—	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 18.3.25. TOCR1x : Timer Output Control Register 1x (x = A, B) and section 18.3.26. TOCR2x : Timer Output Control Register 2x (x = A, B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output correctly if the bits in the TOERA register have not been set. In MTU3 and MTU4, set TOERA prior to setting TIOR.

Set MTU.TOERA after setting the CST3 and CST4 bits in MTU.TSTRA to 0 (see Figure 18.44 and Figure 18.48).

18.3.24 TOERB : Timer Output Master Enable Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OE6B	Master Enable MTIOC6B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
1	OE7A	Master Enable MTIOC7A 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
2	OE7B	Master Enable MTIOC7B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
3	OE6D	Master Enable MTIOC6D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
4	OE7C	Master Enable MTIOC7C 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
5	OE7D	Master Enable MTIOC7D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
7:6	—	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 18.3.25. TOCR1x : Timer Output Control Register 1x (x = A, B) and section 18.3.26. TOCR2x : Timer Output Control Register 2x (x = A, B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output correctly if the bits in the TOERB register have not been set. In MTU6 and MTU7, set TOERB prior to setting TIOR.

Set MTU.TOERB after setting the CST6 and CST7 bits in MTU.TSTRB to 0 (see Figure 18.44 and Figure 18.48).

18.3.25 TOCR1x : Timer Output Control Register 1x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x20E (TOCR1A)
0xA0E (TOCR1B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLSP	Output Level Select P*1 *3 See Table 18.46.	R/W

Bit	Symbol	Function	R/W
1	OLSN	Output Level Select N*1 *3 See Table 18.47.	R/W
2	TOCS	TOC Select 0: TOCR1j setting is selected (j = A, B). 1: TOCR2j setting is selected (j = A, B).	R/W
3	TOCL	TOC Register Write Protection*2 *4 0: Write access to the TOCS, OLSN, and OLSP bits is enabled. 1: Write access to the TOCS, OLSN, and OLSP bits is disabled.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	PSYE	PWM Synchronous Output Enable 0: Toggle output is disabled. 1: Toggle output is enabled.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. Setting the TOCR1j.TOCS bit to 0 makes this bit setting valid.
Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.
Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.
Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset synchronized PWM mode, and control inversion of PWM output level.

OLSP bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

OLSN bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

TOCS bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

PSYE bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM period.

Table 18.46 Output level select function

Bit 0	Function			
			Compare match output	
OLSP	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 18.47 Output level select function

Bit 1	Function			
			Compare match output	
OLSN	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 18.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

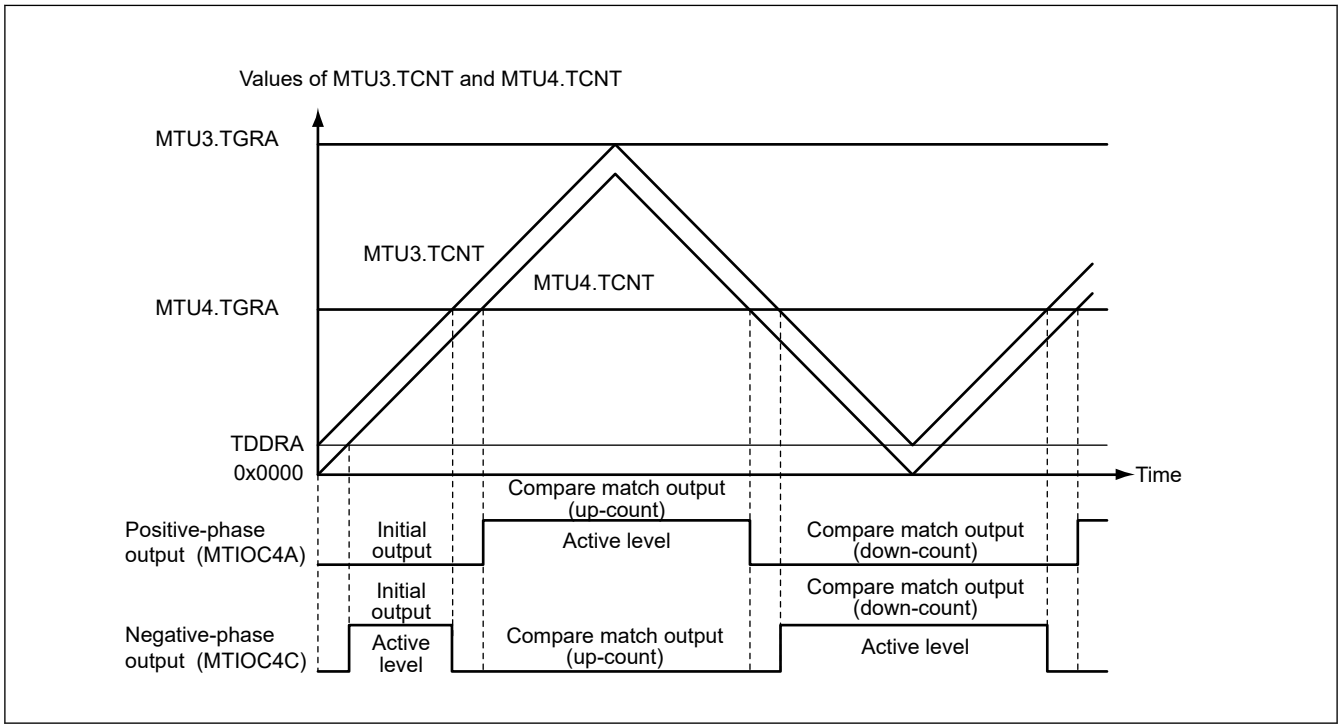


Figure 18.3 Example of output in complementary PWM mode

18.3.26 TOCR2x : Timer Output Control Register 2x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x20F (TOCR2A)
0xA0F (TOCR2B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLS1P	Output Level Select 1P*1 *2 This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See Table 18.48.	R/W
1	OLS1N	Output Level Select 1N*1 *2 This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See Table 18.49.	R/W
2	OLS2P	Output Level Select 2P*1 *2 This bit selects the output level on MTIOC4A or MTIOC7A in reset-synchronized PWM mode and complementary PWM mode. See Table 18.50.	R/W
3	OLS2N	Output Level Select 2N*1 *2 This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See Table 18.51.	R/W

Bit	Symbol	Function	R/W
4	OLS3P	Output Level Select 3P*1 *2 This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See Table 18.52.	R/W
5	OLS3N	Output Level Select 3N*1 *2 This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See Table 18.53.	R/W
7:6	BF[1:0]	TOLBR Buffer Transfer Timing Select These bits select the timing for transferring data from TOLBRj to TOCR2j. See Table 18.54 for details.	R/W

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid (j = A, B).
Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 18.48 MTIOCmB output level select function

Bit 0	Function			
			Compare match output	
OLS1P	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Note: m = 3, 6

			Compare match output	
OLS3N	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: m = 4, 7
Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 18.54 Setting of TOCR2j.BF[1:0] bits

Bit 7	Bit 6	Description	
BF[1]	BF[0]	Complementary PWM mode	Reset-synchronized PWM mode
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
0	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
1	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

Note: n = 4, 7; m = 3, 6; j = A, B

18.3.27 TOLBRx : Timer Output Level Buffer Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x236 (TOLBRA)
0xA36 (TOLBRB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLS1P	Output Level Select 1P Specify the buffer value to be transferred to the OLS1P bit in TOCR2A and TOCR2B.	R/W
1	OLS1N	Output Level Select 1N Specify the buffer value to be transferred to the OLS1N bit in TOCR2A and TOCR2B.	R/W
2	OLS2P	Output Level Select 2P Specify the buffer value to be transferred to the OLS2P bit in TOCR2A and TOCR2B.	R/W

Bit	Symbol	Function	R/W
3	OLS2N	Output Level Select 2N Specify the buffer value to be transferred to the OLS2N bit in TOCR2A and TOCR2B.	R/W
4	OLS3P	Output Level Select 3P Specify the buffer value to be transferred to the OLS3P bit in TOCR2A and TOCR2B.	R/W
5	OLS3N	Output Level Select 3N Specify the buffer value to be transferred to the OLS3N bit in TOCR2A and TOCR2B.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 18.4 shows an example of the PWM output level setting procedure in buffer operation.

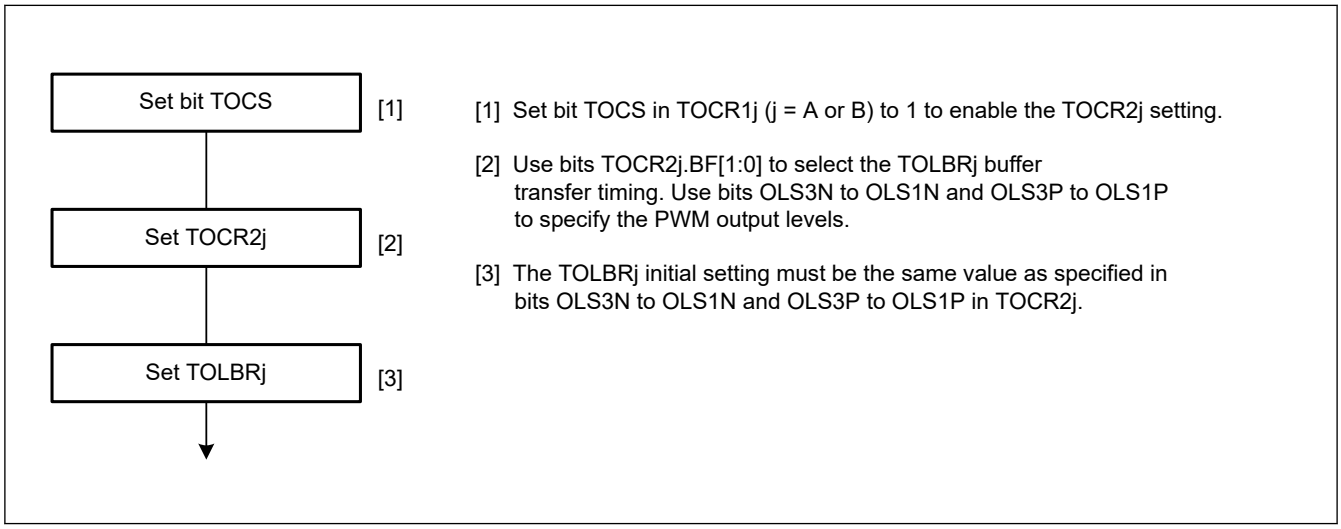

Figure 18.4 Example of PWM output level setting procedure in buffer operation

18.3.28 TGCRA : Timer Gate Control Register A

Base address: MTU = 0x9000_1000

Offset address: 0x20D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BDC	N	P	FB	WF	VF	UF
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	UF	Output Phase Switch These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when FB = 1. In this case, the setting of bit 0 to bit 2 is used instead of the external input. See Table 18.55.	R/W
1	VF	Output Phase Switch See Table 18.55.	R/W
2	WF	Output Phase Switch See Table 18.55.	R/W
3	FB	External Feedback Signal Enable 0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (UF, VF, and WF settings)	R/W

Bit	Symbol	Function	R/W
4	P	Positive-Phase Output (P) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
5	N	Negative-Phase Output (N) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
6	BDC	Brushless DC Motor 0: Ordinary output 1: Functions of this register are made effective	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

UF, VF, and WF bits (Output Phase Switch)

The setting of these bits is valid only when FB = 1. In this case, the setting of bit 0 to bit 2 is used instead of the external input. For details, see Table 18.55.

Table 18.55 Output level select function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U phase	V phase	W phase	U phase	V phase	W phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
0	0	1	ON	OFF	OFF	OFF	OFF	ON
0	1	0	OFF	ON	OFF	ON	OFF	OFF
0	1	1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
1	0	1	ON	OFF	OFF	OFF	ON	OFF
1	1	0	OFF	OFF	ON	ON	OFF	OFF
1	1	1	OFF	OFF	OFF	OFF	OFF	OFF

FB bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA. When the TGCRA.FB bit is 0, output of MTU3 and MTU4 can be switched with the TGRA, TGRB, and TGRC input capture signals in MTU0.

P bit (Positive-Phase Output (P) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

18.3.29 TCNTSx : Timer Subcounter x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x220 (TCNTSA)
0xA20 (TCNTSB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	TCNTSA and TCNTSB are 16-bit read-only counters used only in complementary PWM mode.	R

Note: TCNTSA and TCNTSB should be accessed in 16-bit units.

18.3.30 TCDRx : Timer Cycle Data Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x214 (TCDRA)
0xA14 (TCDRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier period as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count).	R/W

Note: TCDRA and TCDRB should be accessed in 16-bit units.

18.3.31 TCBRx : Timer Cycle Buffer Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x222 (TCBRA)
0xA22 (TCBRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1.	R/W

Note: TCBRA and TCBRB should be accessed in 16-bit units.

18.3.32 TDDRx : Timer Dead Time Data Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x216 (TDDRA)
0xA16 (TDDRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts.	R/W

Note: TDDRA and TDDRB should be accessed in 16-bit units.

18.3.33 TDERx : Timer Dead Time Enable Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x234 (TDERA)
0xA34 (TDERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TDER
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	TDER	Dead Time Enable 0: No dead time is generated 1: Dead time is generated*1	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. TDDRA and TDDRB should be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

TDER bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

18.3.34 TBTERx : Timer Buffer Transfer Set Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x232 (TBTERA)
0xA32 (TBTERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	BTE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	BTE[1:0]	Buffer Transfer Disable and Interrupt Skipping Link Setting These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see Table 18.56.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 18.56 Setting of TBTERA.BTE[1:0] bits and TBTERB.BTE[1:0] bits

Bit 1	Bit 0	
BTE[1]	BTE[0]	Description
0	0	Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1.
0	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2
1	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, see section 18.4.8. Complementary PWM Mode.
Note 2. When interrupt skipping is disabled the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), be sure to disable link of buffer transfer with interrupt skipping (set the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

18.3.35 TWCRx : Timer Waveform Control Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x260 (TWCRA)
0xA60 (TWCRB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CCE	—	—	—	—	—	SCC	WRE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WRE*3	Waveform Retain Enable 0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited	R/W
1	SCC*1*3	Synchronous Clearing Control (Only valid in TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2 to MTU6, and MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2 to MTU6, and MTU7 is disabled.	R/W
6:2	—	These bits are read as 0. The write value should be 0.	R/W
7	CCE*2	Compare Match Clear Enable 0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match	R/W

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.
Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

WRE bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode.

The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values specified in TOCR1A and TOCR2A are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT start operation.

For the Tb interval at the trough in complementary PWM mode, see Figure 18.50.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

SCC bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2 to MTU6, and MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do so in such a way that the values of the CCE and WRE bits are not changed.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, see Figure 18.50.

[Setting condition]

- Writing of 1 to the SCC bit after reading SCC = 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

CCE bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

- When 1 is written to the CCE bit after reading CCE = 0

18.3.36 NFCR — Noise Filter Control Registers

18.3.36.1 NFCRn : Noise Filter Control Register n (n = 0, 3, 4, 6 to 8)

Base address: MTU_NF = 0x9000_1290

Offset address: 0x000 + 0x01 × n (n = 0 to 4, 8)
0x803 + 0x01 × (n - 6) (n = 6, 7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTIOCnA pin is disabled 1: The noise filter for the MTIOCnA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTIOCnB pin is disabled 1: The noise filter for the MTIOCnB pin is enabled	R/W
2	NFCEN	Noise Filter C Enable 0: The noise filter for the MTIOCnC pin is disabled 1: The noise filter for the MTIOCnC pin is enabled	R/W
3	NFDEN	Noise Filter D Enable 0: The noise filter for the MTIOCnD pin is disabled 1: The noise filter for the MTIOCnD pin is enabled	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRn register controls noise filtering for the input pins of MTUn.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

18.3.36.2 NFCRm : Noise Filter Control Register m (m = 1, 2)

Base address: MTU_NF = 0x9000_1290

Offset address: 0x001 (NFCR1), 0x002 (NFCR2)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		—	—	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTIOCmA pin is disabled 1: The noise filter for the MTIOCmA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTIOCmB pin is disabled 1: The noise filter for the MTIOCmB pin is enabled	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRm register (m = 1, 2) controls noise filtering for the input pins of MTUm.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCmA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCmB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

18.3.36.3 NFCRC : Noise Filter Control Register C

Base address: MTU_NF = 0x9000_1290

Offset address: 0x009

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTCLKA pin is disabled 1: The noise filter for the MTCLKA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTCLKB pin is disabled 1: The noise filter for the MTCLKB pin is enabled	R/W
2	NFCEN	Noise Filter C Enable 0: The noise filter for the MTCLKC pin is disabled 1: The noise filter for the MTCLKC pin is enabled	R/W
3	NFDEN	Noise Filter D Enable 0: The noise filter for the MTCLKD pin is disabled 1: The noise filter for the MTCLKD pin is enabled	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/2 1 0: PCLKH/8 1 1: PCLKH/32	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRC register controls noise filtering for the external clock input pins of the MTU.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the counting start.

18.3.36.4 NFCR5 : Noise Filter Control Register 5

Base address: MTU_NF = 0x9000_1290

Offset address: 0x805

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFUEN	Noise Filter U Enable 0: The noise filter for the MTIC5U pin is disabled 1: The noise filter for the MTIC5U pin is enabled	R/W

Bit	Symbol	Function	R/W
1	NFVEN	Noise Filter V Enable 0: The noise filter for the MTIC5V pin is disabled 1: The noise filter for the MTIC5V pin is enabled	R/W
2	NFWEN	Noise Filter W Enable 0: The noise filter for the MTIC5W pin is disabled 1: The noise filter for the MTIC5W pin is enabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCR5 register controls noise filtering for the input pins of MTU5.

NFUEN bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

18.3.37 TADCR — Timer A/D Converter Start Request Control Registers

18.3.37.1 MTU4.TADCR : Timer A/D Converter Start Request Control Register

Base address: MTU4 = 0x9000_1200

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		—	—	—	—	—	—	UT4AE	DT4AE	UT4BE	DT4BE	ITA3AE	ITA4VE	ITB3AE	ITB4VE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ITB4VE	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are linked.	R/W

Bit	Symbol	Function	R/W
1	ITB3AE	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are linked.	R/W
2	ITA4VE	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are linked.	R/W
3	ITA3AE	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are linked.	R/W
4	DT4BE	Down-Count TRG4BN Enable*3 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT down-count operation. 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT down-count operation.	R/W
5	UT4BE	Up-Count TRG4BN Enable 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT up-count operation. 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT up-count operation.	R/W
6	DT4AE	Down-Count TRG4AN Enable*3 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation. 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation.	R/W
7	UT4AE	Up-Count TRG4AN Enable 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation. 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT up-count operation.	R/W
13:8	—	These bits are read as 0. The write value should be 0.	R/W
15:14	BF[1:0]	MTU4.TADCOBRA/TADCOBRB Transfer Timing Select These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB. For detail, see Table 18.57.	R/W

Note: MTU4.TADCR should be accessed in 16-bit units.
Note 1. When interrupt skipping is disabled (the T3AEN and T4VEN bits in TITCR1A are cleared to 0 or the T3ACOR and T4VCOR bits in TITCR1A are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 18.57 Setting of transfer timing by TADCR.BF[1:0] bits (MTU4) (1 of 2)

BF[1]	BF[0]	Description
0	0	Does not transfer data from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB).
0	1	Data is transferred from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB) when the crest of the MTU4.TCNT count is reached or the MTU4.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU3.TCNT and MTU3.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU4.TCNT and MTU4.TGRA in PWM mode 1 or normal operation mode.

Table 18.57 Setting of transfer timing by TADCR.BF[1:0] bits (MTU4) (2 of 2)

BF[1]	BF[0]	Description
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU4.TCNT count. These settings are prohibited when complementary PWM mode is not selected.
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU4.TCNT count. These settings are prohibited when complementary PWM mode is not selected.

18.3.37.2 MTU7.TADCR : Timer A/D Converter Start Request Control Register

Base address: MTU7 = 0x9000_1A00

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		—	—	—	—	—	—	UT7AE	DT7AE	UT7BE	DT7BE	ITA6AE	ITA7VE	ITB6AE	ITB7VE

6	DT7AE	Down-Count TRG7AN Enable*3 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT down-count operation. 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT down-count operation.	R/W

Bit	Symbol	Function	R/W
7	UT7AE	Up-Count TRG7AN Enable 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT up-count operation. 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT up-count operation.	R/W
13:8	—	These bits are read as 0. The write value should be 0.	R/W
15:14	BF[1:0]	MTU7.TADCOBRA/TADCOBRB Transfer Timing Select These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB. For detail, see Table 18.58.	R/W

Note: MTU7.TADCR should be accessed in 16-bit units.
Note 1. When interrupt skipping is disabled (the T6AEN and T7VEN bits in TITCR1B are cleared to 0 or the T6ACOR and T7VCOR bits in TITCR1B are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests are not issued.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function.

Table 18.58 Setting of transfer timing by TADCR.BF[1:0] bits (MTU7)

BF[1]	BF[0]	Description
0	0	Does not transfer data from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).
0	1	Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when the crest of the MTU7.TCNT count is reached or the MTU7.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU6.TCNT and MTU6.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU7.TCNT and MTU7.TGRA in PWM mode 1 or normal operation mode.
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU7.TCNT count. These settings are prohibited when complementary PWM mode is not selected.
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU7.TCNT count. These settings are prohibited when complementary PWM mode is not selected.

18.3.38 TADCORx : Timer A/D Converter Start Request Cycle Set Register x (x = A, B)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x044 (TADCORA)
0x046 (TADCORB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.	R/W

Note: The TADCORA and TADCORB registers should be accessed in 16-bit units.

When the A/D converter start request delaying function linked with skipping function 1 (for details, see section 18.4.9.4. A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1) is used, the value of this register should be 0x0002 to TCDRA setting − 2 in MTU4 and 0x0002 to TCDRB setting − 2 in MTU7.

When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

1. When skipping function 2 is specified with the skipping count set to 0
   - The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
   - The TADCORA compare interval should be equal to or greater than 4 PCLKH cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value − 4 or smaller).
   - The TADCORB compare interval should be equal to or greater than 4 PCLKH cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value − 4 or smaller).
2. When skipping function 2 is specified with the skipping count set to 1 or greater
   - The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
   - The TADCORB compare interval should be equal to or greater than 2 PCLKH cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value − 2 or smaller)

18.3.39 TADCOBRx : Timer A/D Converter Start Request Cycle Set Buffer Register x (x = A, B)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x048 (TADCOBRA)
0x04A (TADCOBRB)

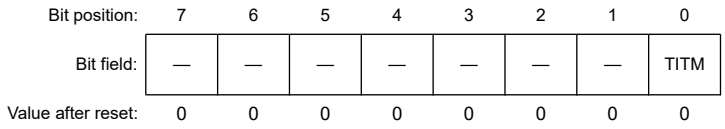
Bit	Symbol	Function	R/W
15:0	n/a	TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.	R/W

Note: TADCOBRA and TADCOBRB should be accessed in 16-bit units.

18.3.40 TITMRx : Timer Interrupt Skipping Mode Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x23A (TITMRA)
0xA3A (TITMRB)



Bit	Symbol	Function	R/W
0	TITM	Interrupt Skipping Function Select Selects one of the two types of interrupt skipping functions. 0: Selects interrupt skipping function 1 Setting the TITCR1A or TITCR1B register enables interrupt skipping function 1. 1: Selects interrupt skipping function 2 Setting the TITCR2A or TITCR2B register enables interrupt skipping function 2.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TITMRA and TITMRB are used to select either of two skipping functions.

18.3.41 TITCR1A : Timer Interrupt Skipping Set Register 1A

Base address: MTU = 0x9000_1000

Offset address: 0x230

Bit position:	7	6	5	4	3	2	1	0
Bit field:	T3AEN	T3ACOR[2:0]			T4VEN	T4VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T4VCOR[2:0]	TCIV4 Interrupt Skipping Count Setting These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TCIV4 interrupts. 0 0 1: Sets the TCIV4 interrupt skipping count to 1. 0 1 0: Sets the TCIV4 interrupt skipping count to 2. 0 1 1: Sets the TCIV4 interrupt skipping count to 3. 1 0 0: Sets the TCIV4 interrupt skipping count to 4. 1 0 1: Sets the TCIV4 interrupt skipping count to 5. 1 1 0: Sets the TCIV4 interrupt skipping count to 6. 1 1 1: Sets the TCIV4 interrupt skipping count to 7.	R/W
3	T4VEN	TCIV4 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W
6:4	T3ACOR[2:0]	TGIA3 Interrupt Skipping Count Setting These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TGIA3 interrupts. 0 0 1: Sets the TGIA3 interrupt skipping count to 1. 0 1 0: Sets the TGIA3 interrupt skipping count to 2. 0 1 1: Sets the TGIA3 interrupt skipping count to 3. 1 0 0: Sets the TGIA3 interrupt skipping count to 4. 1 0 1: Sets the TGIA3 interrupt skipping count to 5. 1 1 0: Sets the TGIA3 interrupt skipping count to 6. 1 1 1: Sets the TGIA3 interrupt skipping count to 7.	R/W
7	T3AEN	TGIA3 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed. Before changing the interrupt skipping count, be sure to set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

The TITCR1A register enables or disables interrupt skipping and specifies the interrupt skipping count. This setting is valid only while the TITMRA.TITM bit is set to 0; when the TITMRA.TITM bit is set to 1, the setting in the TITCR1A register is cleared.

18.3.42 TITCR1B : Timer Interrupt Skipping Set Register 1B

Base address: MTU = 0x9000_1000

Offset address: 0xA30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	T6AEN	T6ACOR[2:0]			T7VEN	T7VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T7VCOR[2:0]	TCIV7 Interrupt Skipping Count Setting These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TCIV7 interrupts. 0 0 1: Sets the TCIV7 interrupt skipping count to 1. 0 1 0: Sets the TCIV7 interrupt skipping count to 2. 0 1 1: Sets the TCIV7 interrupt skipping count to 3. 1 0 0: Sets the TCIV7 interrupt skipping count to 4. 1 0 1: Sets the TCIV7 interrupt skipping count to 5. 1 1 0: Sets the TCIV7 interrupt skipping count to 6. 1 1 1: Sets the TCIV7 interrupt skipping count to 7.	R/W
3	T7VEN	TCIV7 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W
6:4	T6ACOR[2:0]	TGIA6 Interrupt Skipping Count Setting These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TGIA6 interrupts. 0 0 1: Sets the TGIA6 interrupt skipping count to 1. 0 1 0: Sets the TGIA6 interrupt skipping count to 2. 0 1 1: Sets the TGIA6 interrupt skipping count to 3. 1 0 0: Sets the TGIA6 interrupt skipping count to 4. 1 0 1: Sets the TGIA6 interrupt skipping count to 5. 1 1 0: Sets the TGIA6 interrupt skipping count to 6. 1 1 1: Sets the TGIA6 interrupt skipping count to 7.	R/W
7	T6AEN	TGIA6 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

The TITCR1B register enables or disables interrupt skipping and specifies the interrupt skipping count. This setting is valid only while the TITMRB.TITM bit is set to 0; when the TITMRB.TITM bit is set to 1, the setting in the TITCR1B register is cleared.

18.3.43 TITCNT1A : Timer Interrupt Skipping Counter 1A

Base address: MTU = 0x9000_1000

Offset address: 0x231

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T4VCNT[2:0]	TCIV4 Interrupt Counter While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.	R
3	—	This bit is read as 0.	R
6:4	T3ACNT[2:0]	TGIA3 Interrupt Counter While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.	R
7	—	This bit is read as 0.	R

Note: To clear the TITCNT1A, set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A is 8-bit readable/writable counters. TITCNT1A retains their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT.

T4VCNT[2:0] bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is set to 0
- When the T4VCOR[2:0] bits in TITCR1A are set to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

T3ACNT[2:0] bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is set to 0
- When the T3ACOR[2:0] bits in TITCR1A are set to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

18.3.44 TITCNT1B : Timer Interrupt Skipping Counter 1B

Base address: MTU = 0x9000_1000

Offset address: 0xA31

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	T6ACNT[2:0]			—	T7VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T7VCNT[2:0]	TCIV7 Interrupt Counter While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.	R
3	—	This bit is read as 0.	R
6:4	T6ACNT[2:0]	TGIA6 Interrupt Counter While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.	R
7	—	This bit is read as 0.	R

Note: To clear the TITCNT1B, set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

TITCNT1B is 8-bit readable/writable counters. TITCNT1B retains their values even after stopping the count operation of MTU6.TCNT and MTU7.TCNT.

T7VCNT[2:0] bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is set to 0
- When the T7VCOR[2:0] bits in TITCR1B are set to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is set to 0
- When the T6ACOR[2:0] bits in TITCR1B are set to 000b

- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

18.3.45 TITCR2A : Timer Interrupt Skipping Set Register 2A

Base address: MTU = 0x9000_1000

Offset address: 0x23B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG4COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG4COR[2:0]	TRG4AN/TRG4BN Interrupt Skipping Count Setting These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. 0 0 0: Does not skip TRG4AN and TRG4BN interrupts. 0 0 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 1. 0 1 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 2. 0 1 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 3. 1 0 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 4. 1 0 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 5. 1 1 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 6. 1 1 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 7.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TITCR2A specifies the interrupt skipping count for TRG4AN and TRG4BN.

This setting is valid only while TITMRA is set to 1.

18.3.46 TITCR2B : Timer Interrupt Skipping Set Register 2B

Base address: MTU = 0x9000_1000

Offset address: 0xA3B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG7COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG7COR[2:0]	TRG7AN/TRG7BN Interrupt Skipping Count Setting These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. 0 0 0: Does not skip TRG7AN and TRG7BN interrupts. 0 0 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 1. 0 1 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 2. 0 1 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 3. 1 0 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 4. 1 0 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 5. 1 1 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 6. 1 1 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 7.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TITCR2B specifies the interrupt skipping count for TRG7AN and TRG7BN.

This setting is valid only while TITMRB is set to 1.

18.3.47 TITCNT2A : Timer Interrupt Skipping Counter 2A

Base address: MTU = 0x9000_1000

Offset address: 0x23C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG4CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG4CNT[2:0]	TRG4AN/TRG4BN Interrupt Counter These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.	R
7:3	—	These bits are read as 0.	R

TITCNT2A starts counting from the values set in the TRG4COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

TRG4CNT[2:0] bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are set to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

18.3.48 TITCNT2B : Timer Interrupt Skipping Counter 2B

Base address: MTU = 0x9000_1000

Offset address: 0xA3C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG7CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG7CNT[2:0]	TRG7AN/TRG7BN Interrupt Counter These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.	R
7:3	—	These bits are read as 0.	R

TITCNT2B starts counting from the values set in the TRG7COR[2:0] bits and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

TRG7CNT[2:0] bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0

- When the TRG7COR[2:0] bits in TITCR2B are set to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

18.3.49 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Always access these registers in 32-bit units.

The timer counters (MTU0.TCNT to MTU7.TCNT) excluding MTU8, general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/write is not allowed. Always access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. A 16-bit data bus to the CPU enables 16-bit read/write access. These registers can also be accessed in 8-bit units.

18.4 Operations

18.4.1 Basic Functions

Each channel has TCNT and TGR. TCNT performs up-counting, and is also capable of free-running operation, periodic counting, and external event counting.

Each TGR can be used as an input capture register or an output compare register.

18.4.1.1 Counter Operation

When one of bits CST0 to CST4 and CST8 in the TSTRA register, bits CST6 and CST7 in the TSTRB register, and bits CSTU5, CSTV5, and CSTW5 in the MTU5.TSTR register is set to 1, TCNT for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

(1) Example of Count Operation Setting Procedure

Figure 18.5 shows an example of the count operation setting procedure.

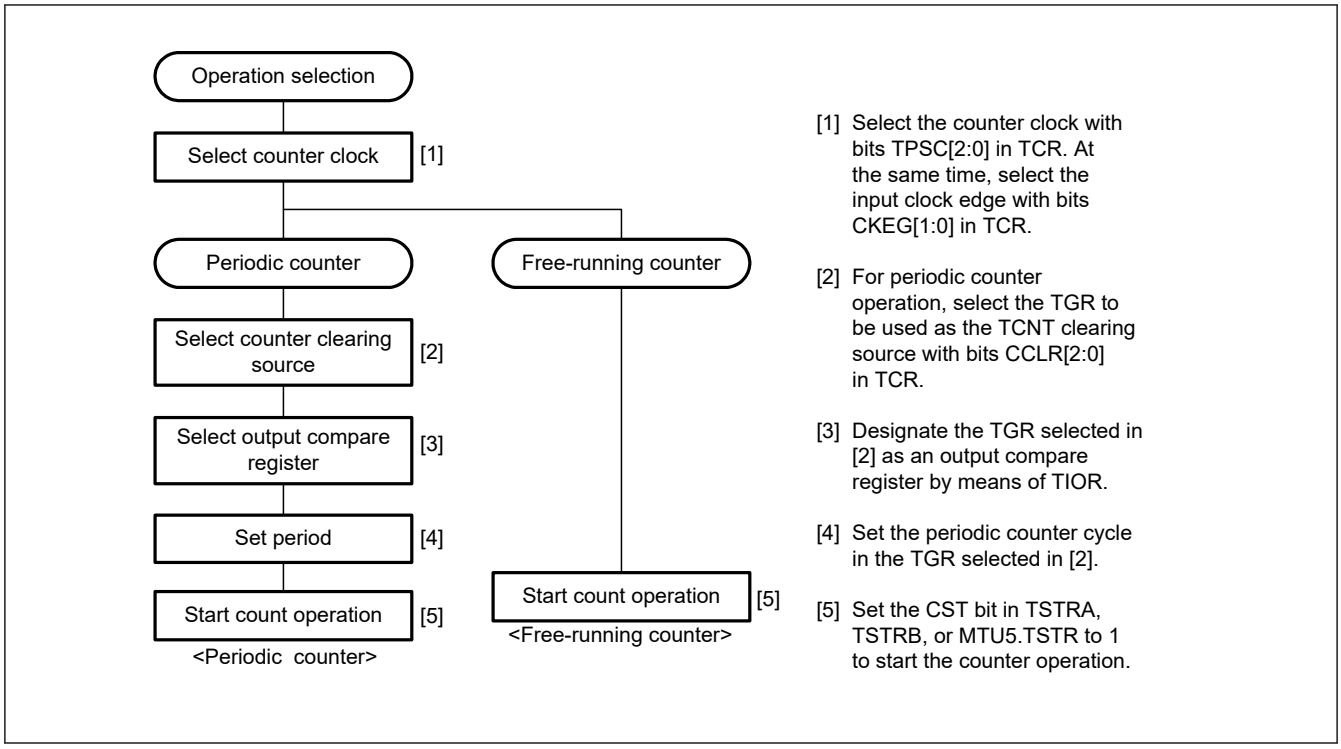


Figure 18.5 Example of count operation setting procedure

(2) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, the MTU's TCNT counters are all designated as free-running counters. When the relevant bit in TSTRA, TSTRB, or MTU5.TSTR is set to 1, the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from 0xFFFF to 0x0000), if the corresponding TIER.TCIEV bit is 1, the MTU requests an interrupt. After an overflow, TCNT starts counting up again from 0x0000.

Figure 18.6 shows free-running counter operation.

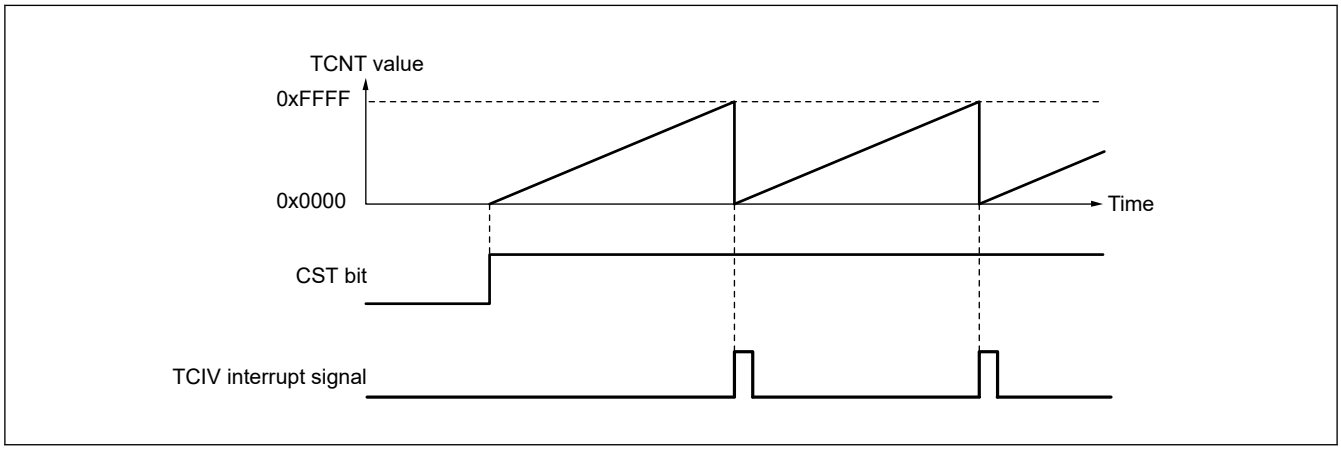

Figure 18.6 Free-running counter operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the corresponding bit in TSTRA, TSTRB or MTU5.TSTR is set to 1. When the count matches the value in TGR, TCNT is cleared to 0x0000.

If the value of the corresponding TIER.TGIE bit is 1 at this point, the MTU requests an interrupt. After a compare match, TCNT starts counting up again from 0x0000.

Figure 18.7 shows periodic counter operation.

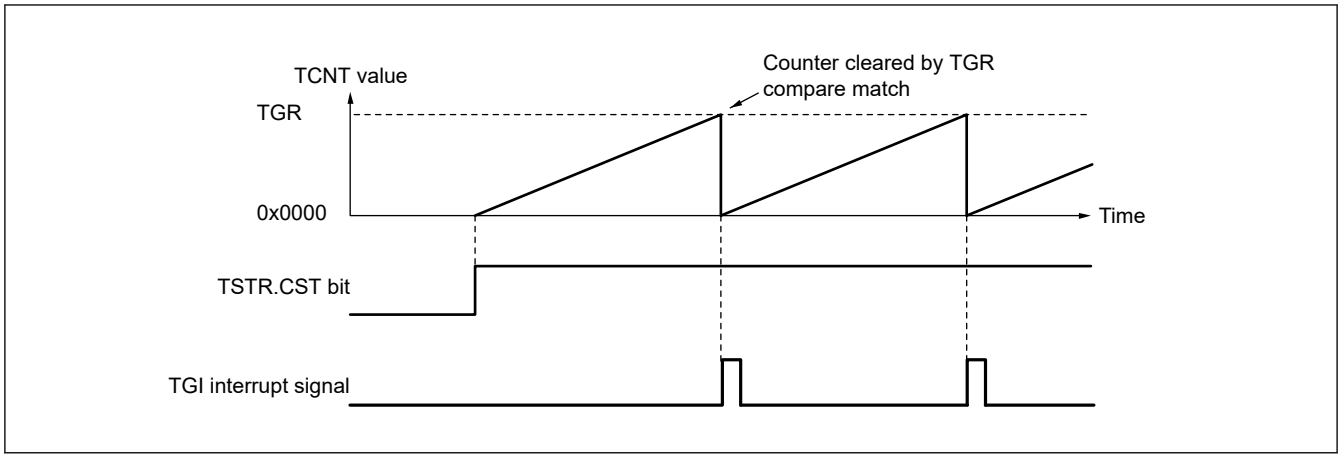

Figure 18.7 Periodic counter operation

18.4.1.2 Waveform Output by Compare Match

The MTU can output low or high or toggles output from the corresponding output pin using compare match. Note that MTU5 cannot output compare-match signals.

(1) Example of Procedure for Setting Waveform Output by Compare Match

Figure 18.8 shows an example of the procedure for setting waveform output by compare match.

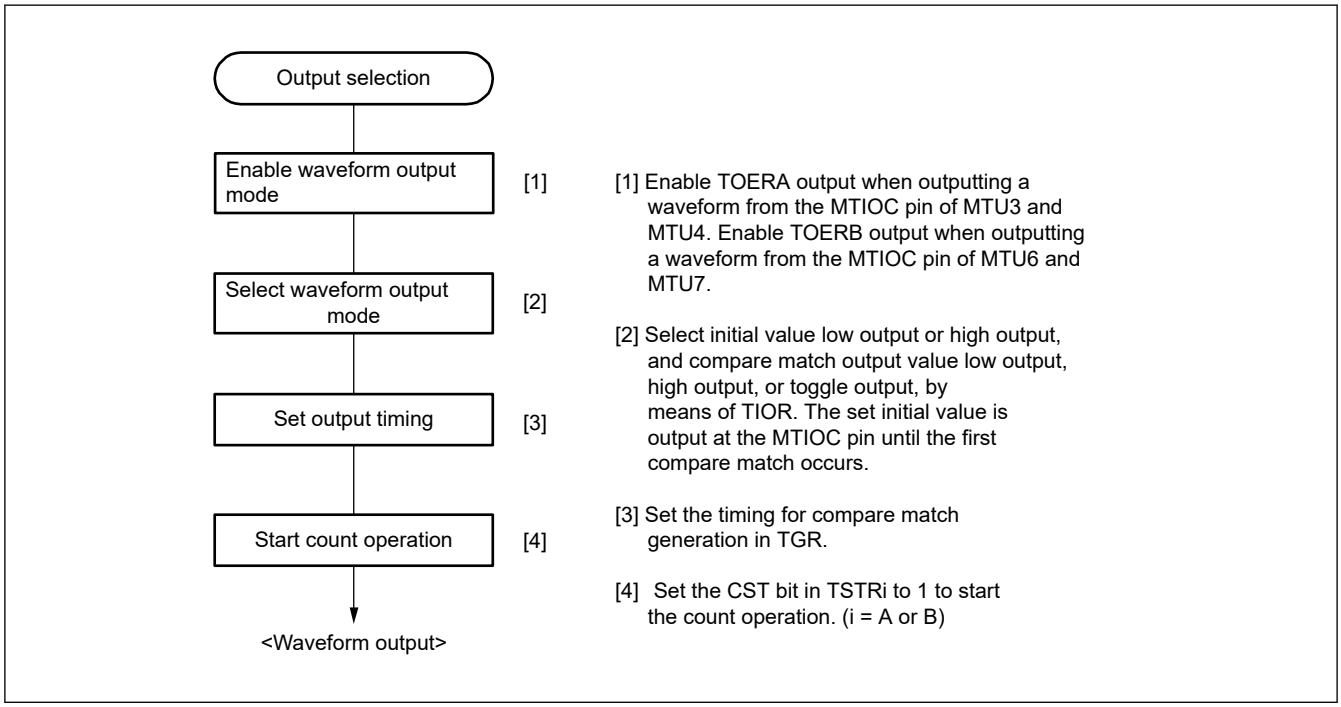

Figure 18.8 Example of procedure for setting waveform output by compare match

(2) Examples of Waveform Output Operation

Figure 18.9 shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

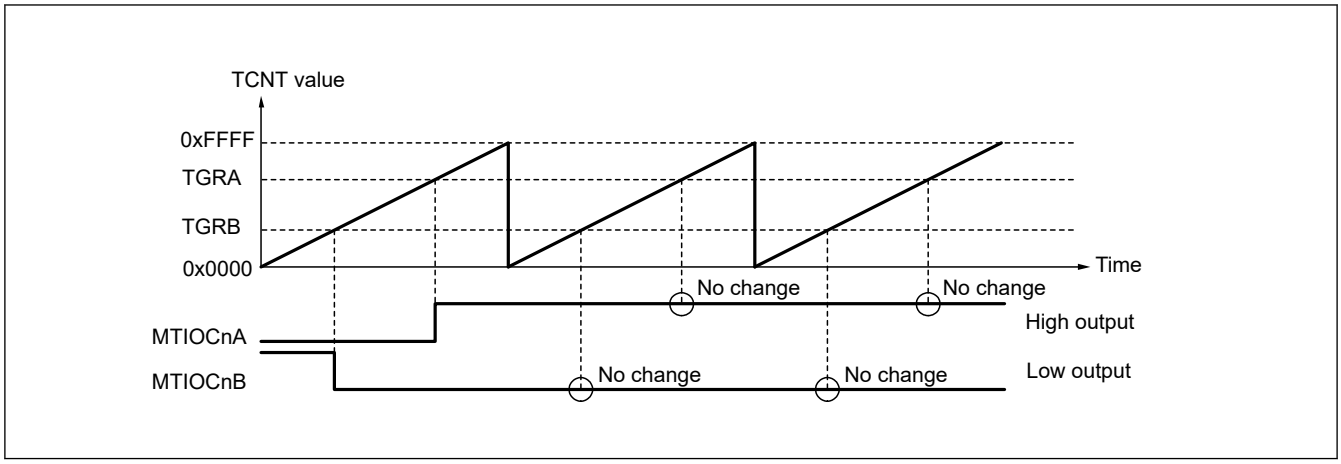

Figure 18.9 Example of low output and high output operation

Figure 18.10 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

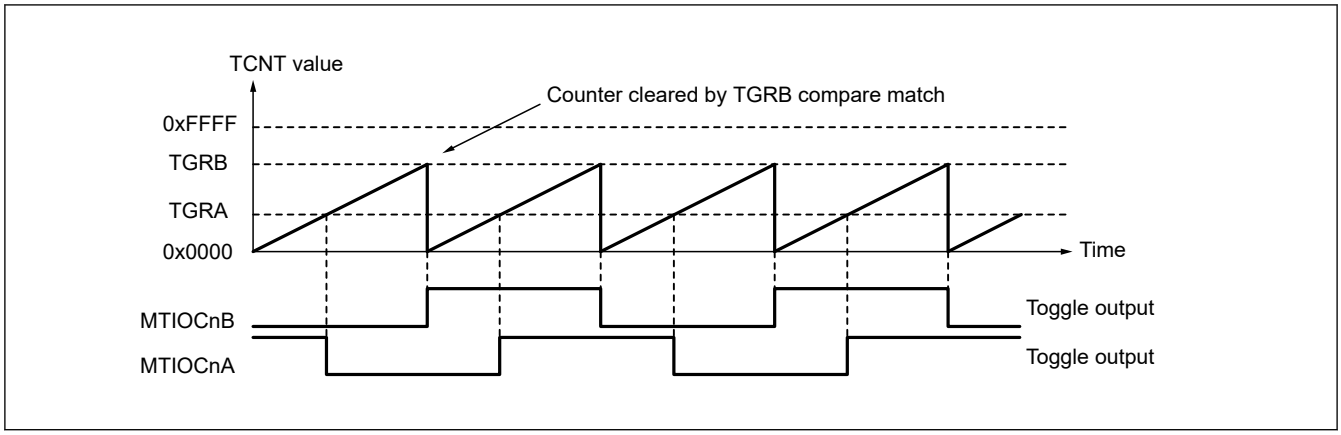

Figure 18.10 Example of toggle output operation

18.4.1.3 Input Capture Function

The TCNT value can be transferred to TGR on detection of an edge input on the MTIOCnm (n = 0 to 4, 6, 7, or 8, m = A to D), MTIC5U, MTIC5V, or MTIC5W pin.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, a count clock of another channel or compare match signal can also be specified as the input capture source.

Note: When a count input clock of another channel is used as the input capture input for MTU0 and MTU1, PCLKH/1 should not be selected as the count input clock used for input capture input. Input capture is not generated if PCLKH/1 is selected.

(1) Example of Input Capture Operation Setting Procedure

Figure 18.11 shows an example of the input capture operation setting procedure.

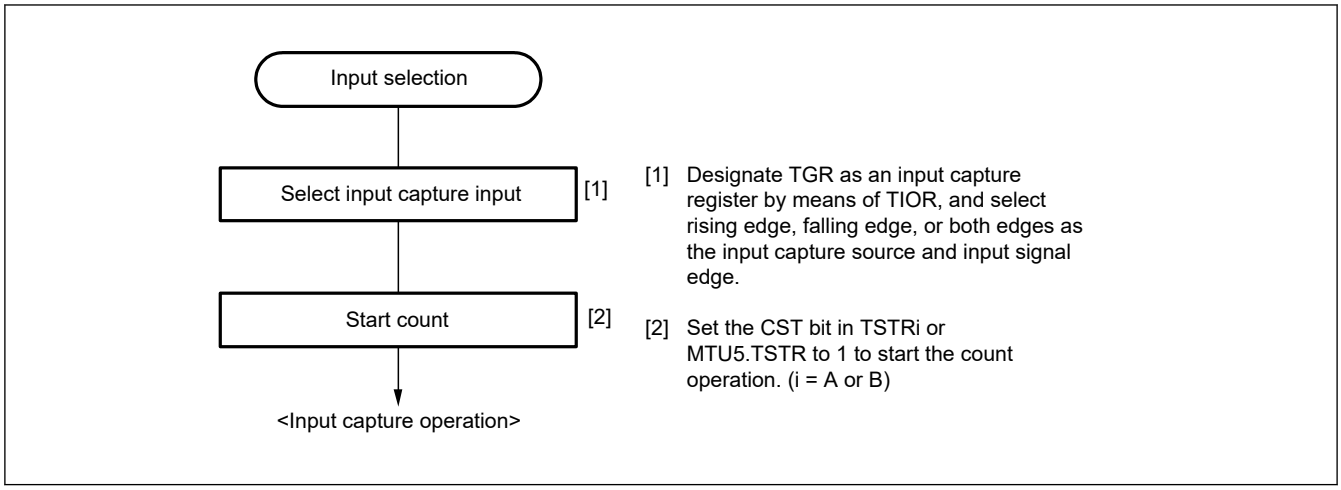

Figure 18.11 Example of input capture operation setting procedure

(2) Example of Input Capture Operation

Figure 18.12 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

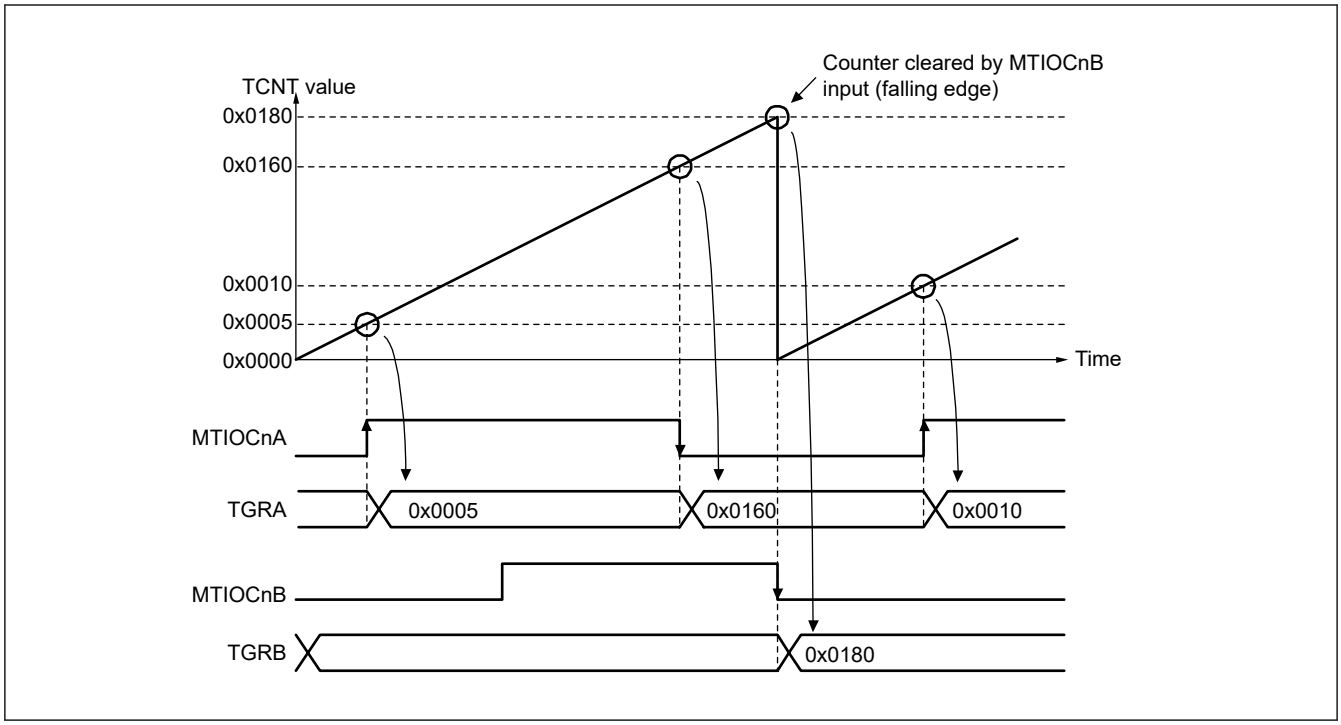

Figure 18.12 Example of input capture operation (n = 0 to 4, 6, 7, 8)

18.4.2 Synchronous Operation

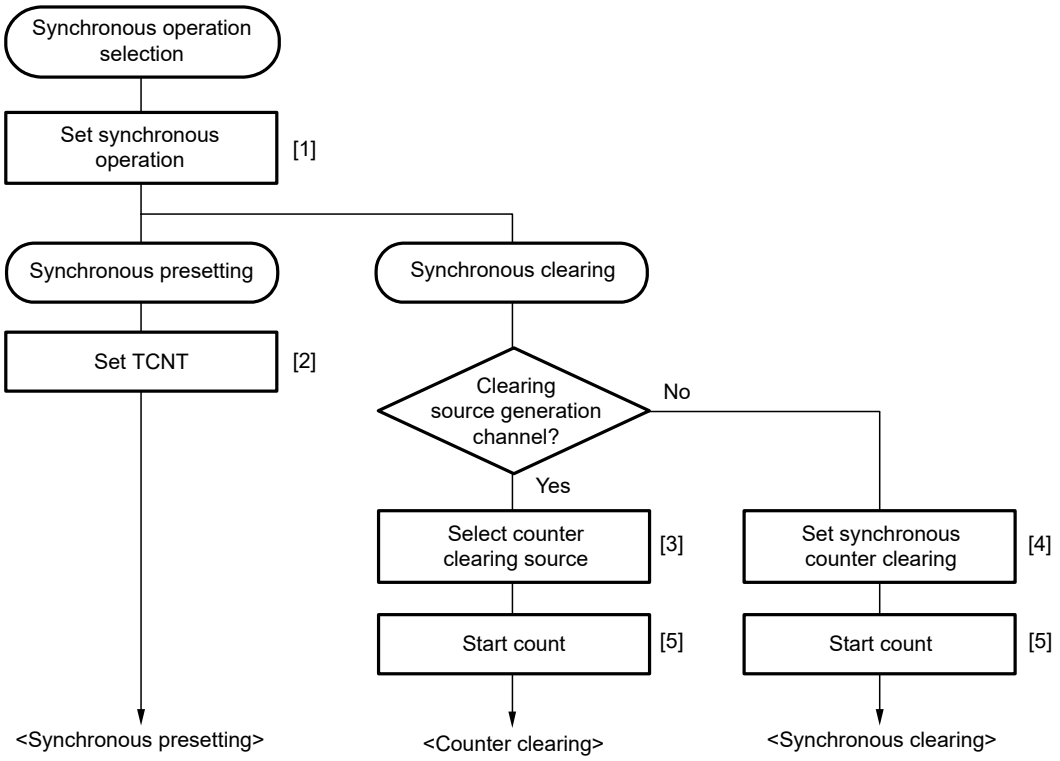
In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous presetting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation increases the number of TGR registers assigned to a single time base.

MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

18.4.2.1 Example of Synchronous Operation Setting Procedure

Figure 18.13 shows an example of the synchronous operation setting procedure.



[1] Set to 1 the SYNC bits in TSYRj corresponding to the channels to be designated for synchronous operation. (j = A or B)
[2] When the TCNT counter of any of the channels designated for synchronous operation is written to, the same value is simultaneously written to the other TCNT counters.
[3] Use bits CCLR[2:0] in TCR to specify TCNT clearing by input capture/output compare, etc.
[4] Use bits CCLR[2:0] in TCR to designate synchronous clearing for the counter clearing source.
[5] Set to 1 the CST bits in TSTRj for the relevant channels, to start the count operation. (j = A or B)

Figure 18.13 Example of synchronous operation setting procedure

18.4.2.2 Example of Synchronous Operation

Figure 18.14 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous presetting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.

For details of PWM modes, see section 18.4.5. PWM Modes.

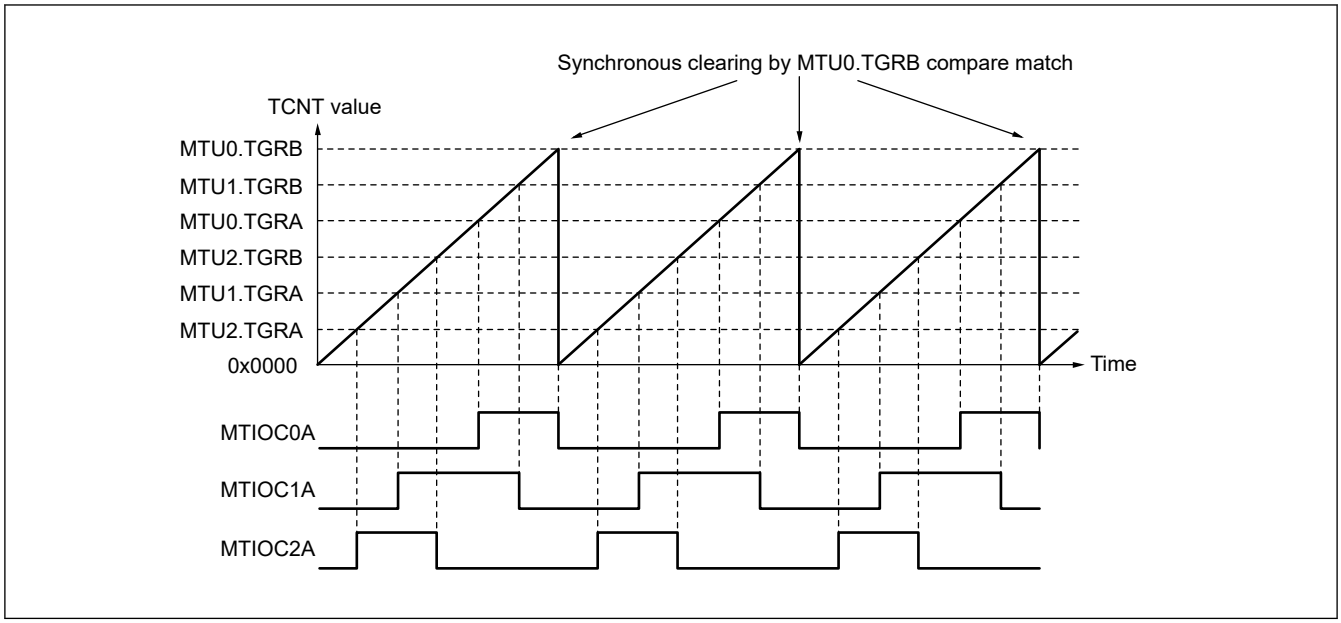


Figure 18.14 Example of synchronous operation

18.4.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 18.59 shows the register combinations used in buffer operation.

Table 18.59 Register combinations in buffer operation

Channel	Timer general register	Buffer register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

(1) When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in Figure 18.15.

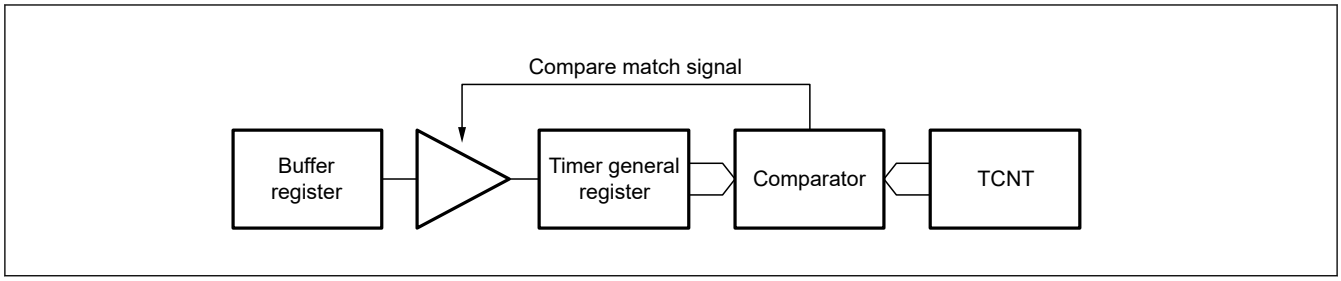

Figure 18.15 Compare match buffer operation

(2) When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in Figure 18.16.

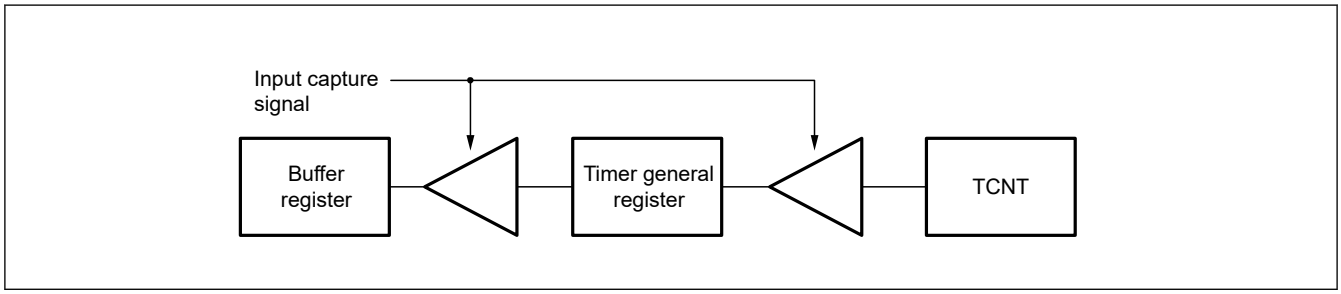

Figure 18.16 Input capture buffer operation

18.4.3.1 Example of Buffer Operation Setting Procedure

Figure 18.17 shows an example of the buffer operation setting procedure.

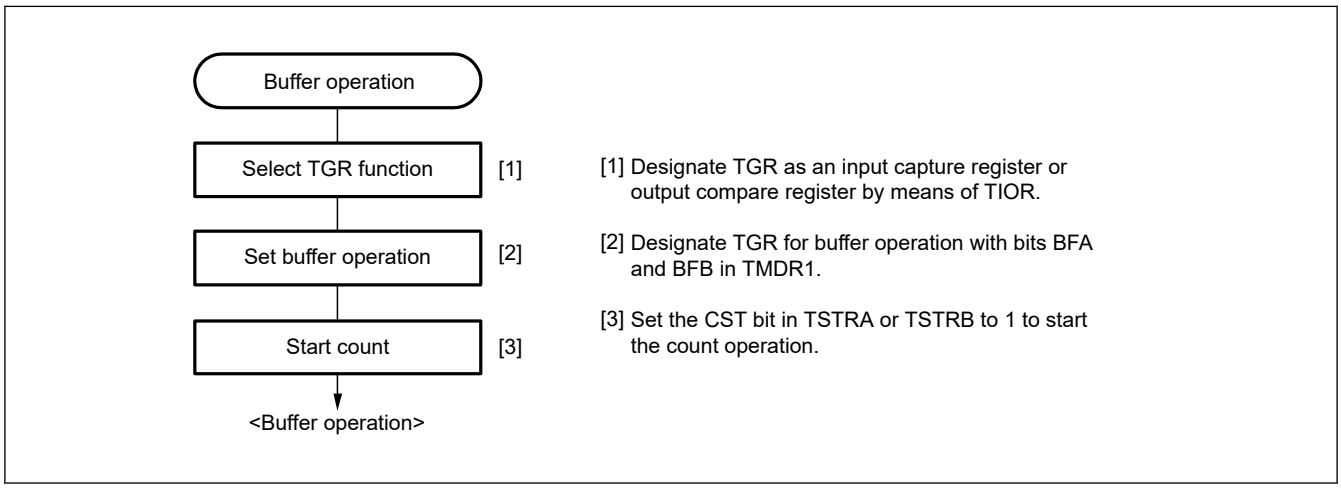

Figure 18.17 Example of buffer operation setting procedure

18.4.3.2 Examples of Buffer Operation

(1) When TGR is an Output Compare Register

Figure 18.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and TGRC has been designated as a buffer register for TGRA. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is set to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see section 18.4.5. PWM Modes.

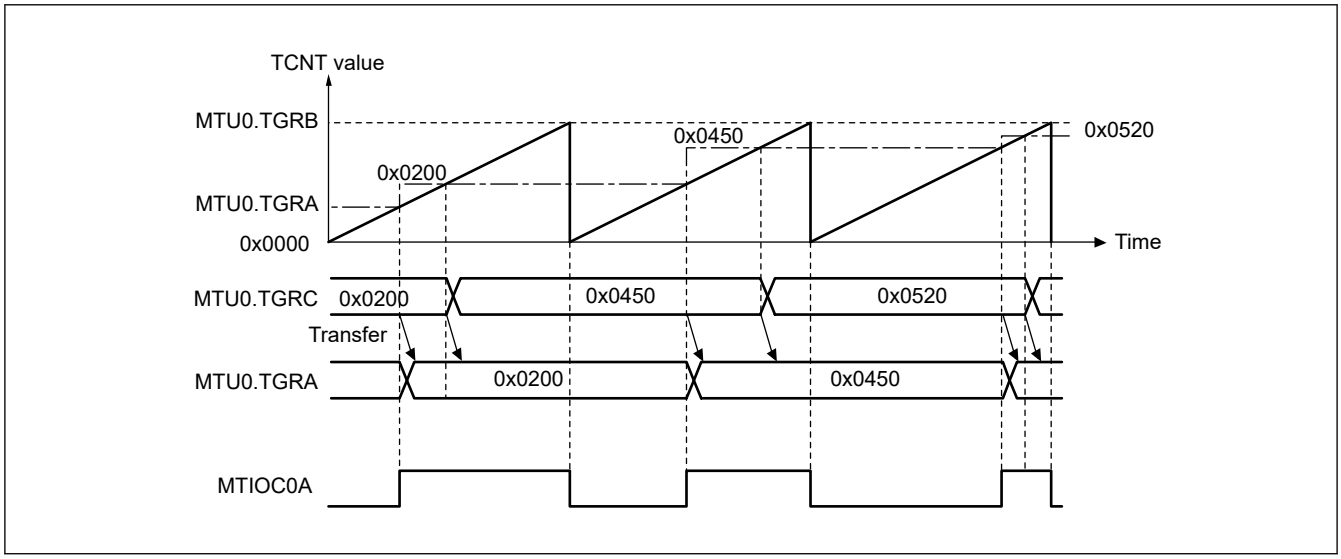

Figure 18.18 Example of buffer operation (1)

(2) When TGR is an Input Capture Register

Figure 18.19 shows an operation example in which TGRA has been designated as an input capture register, and TGRC has been designated as a buffer register for TGRA.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)

As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

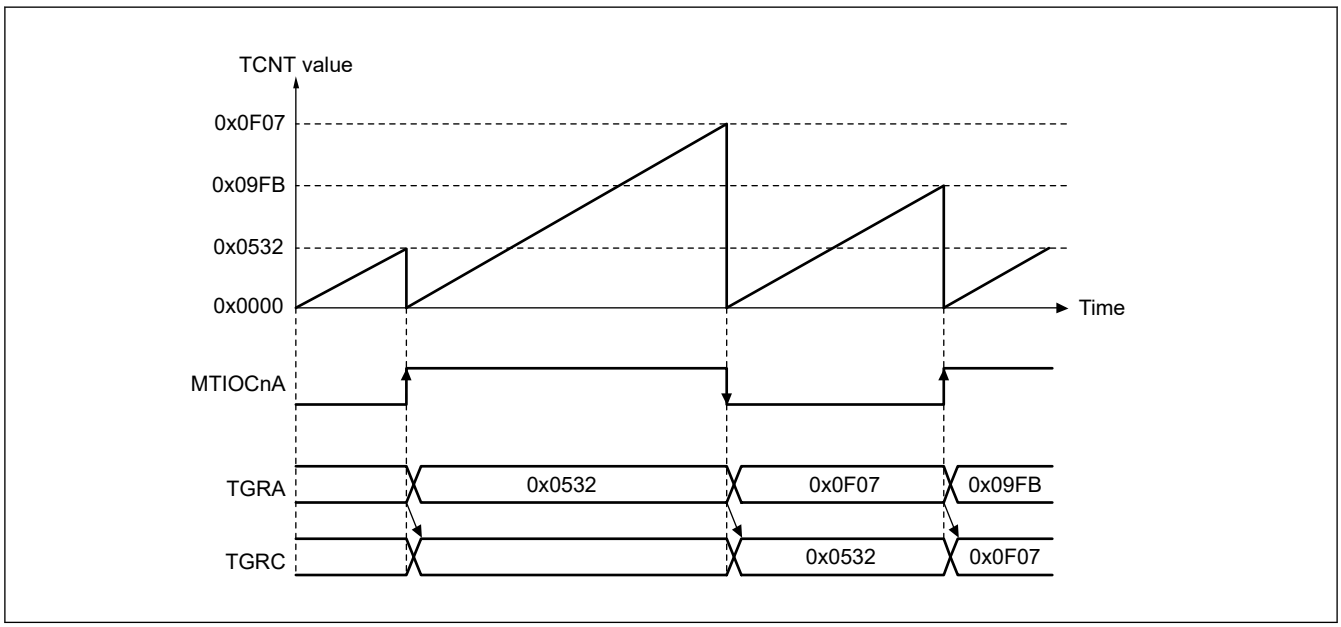

Figure 18.19 Example of buffer operation (2) (n = 0 to 4, 6, 7, 8)

18.4.3.3 Selecting Timing for Transfer from Buffer Registers to Timer General Registers in PWM Mode

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM

(n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (0xFFFF to 0x0000)
- When 0x0000 is written to TCNT during counting
- When TCNT is set to 0x0000 under the condition specified in the CCLR[2:0] bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 18.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

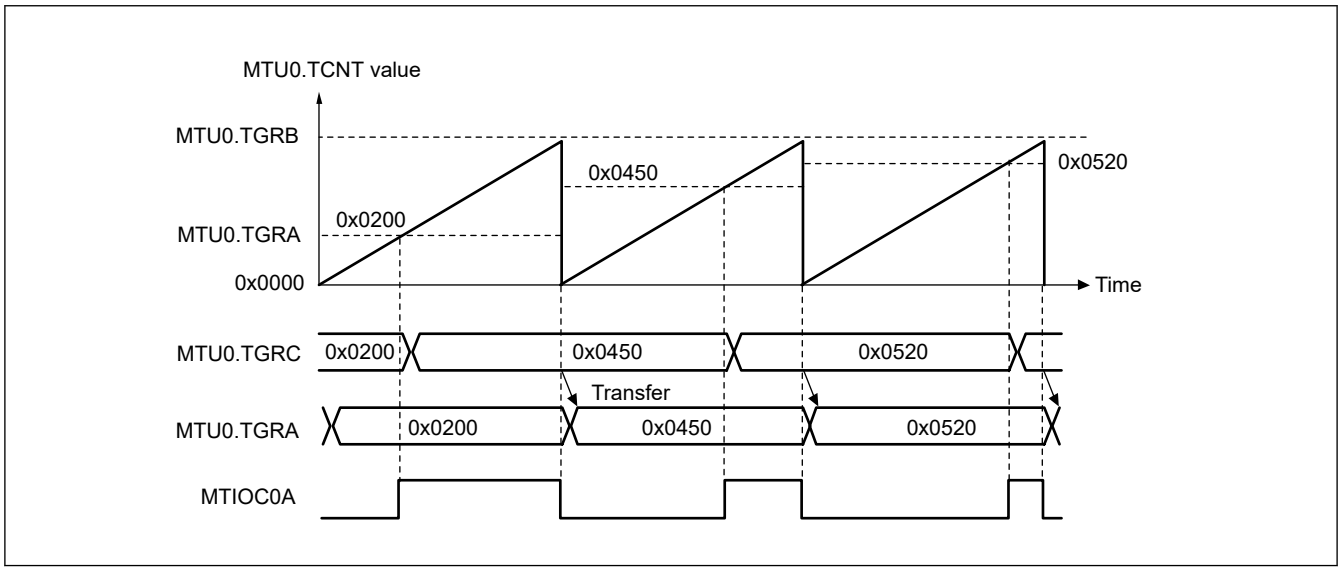

Figure 18.20 Example of buffer operation when MTU0.TCNT clearing is selected for MTU0.TGRC to MTU0.TGRA transfer timing

18.4.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, see section 18.4.6.2. Cascade Connection 32-Bit Phase Counting Mode. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function operates when the MTU1.TMDR3.LWA bit is set to 0 and the MTU1.TCR.TPSC[2:0] bits are set so that MTU1.TCNT counts at an overflow/underflow of MTU2.TCNT. Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 18.60 shows the register combinations used in cascaded operation.

When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 18.60 Cascaded combinations

Combination	Upper 16 bits	Lower 16 bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection.

For details, see section 18.4.4.4. Cascaded Operation Example (c). For input capture in cascade connection, see section 18.7.21. Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection.

Table 18.61 shows the TICCR setting and input capture input pins.

Table 18.61 TICCR setting and input capture input pins

Target input capture	TICCR setting	Input capture input pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (Initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (Initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (Initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (Initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

18.4.4.1 Example of Cascaded Operation Setting Procedure

Figure 18.21 shows an example of the cascaded operation setting procedure.

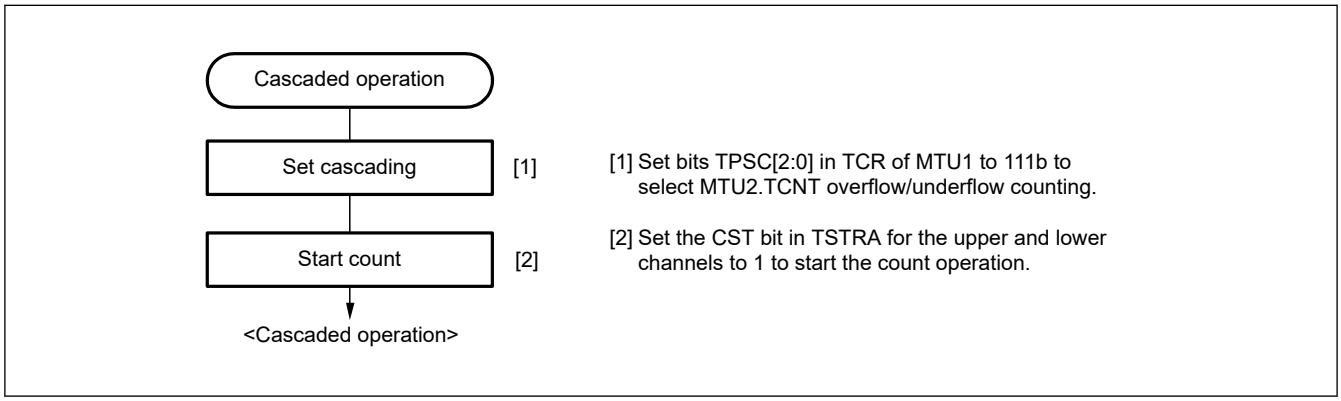

Figure 18.21 Cascaded operation setting procedure

18.4.4.2 Cascaded Operation Example (a)

Figure 18.22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode while MTU1.TCNT and MTU2.TCNT are cascaded.

MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

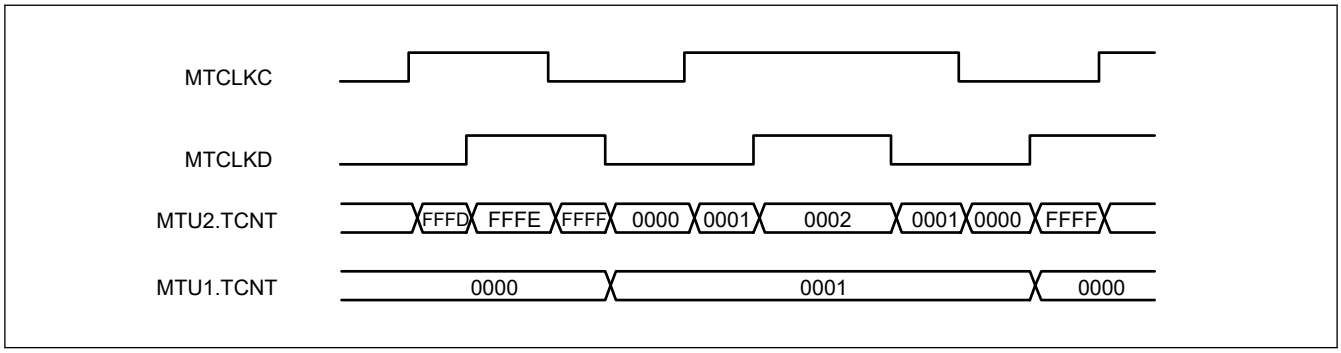

Figure 18.22 Cascaded operation example (a)

18.4.4.3 Cascaded Operation Example (b)

Figure 18.23 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

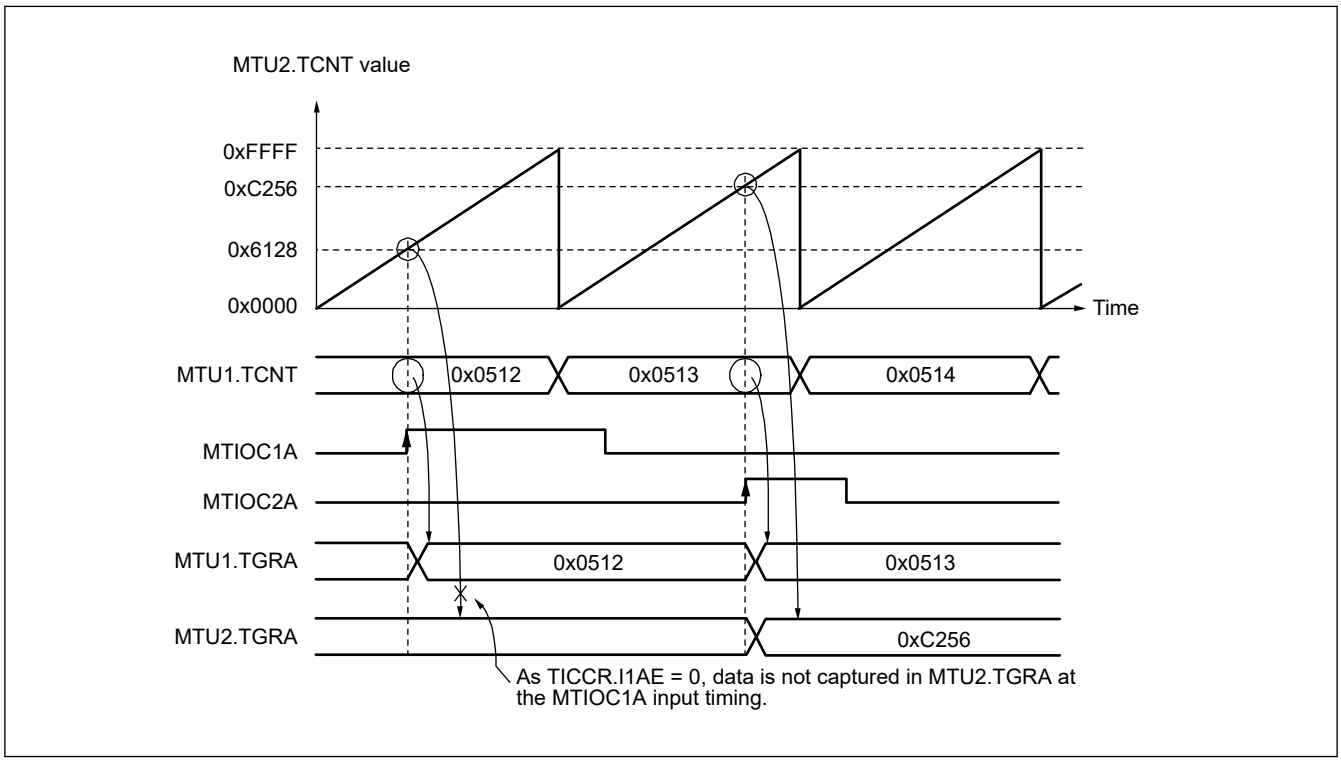

Figure 18.23 Cascaded operation example (b)

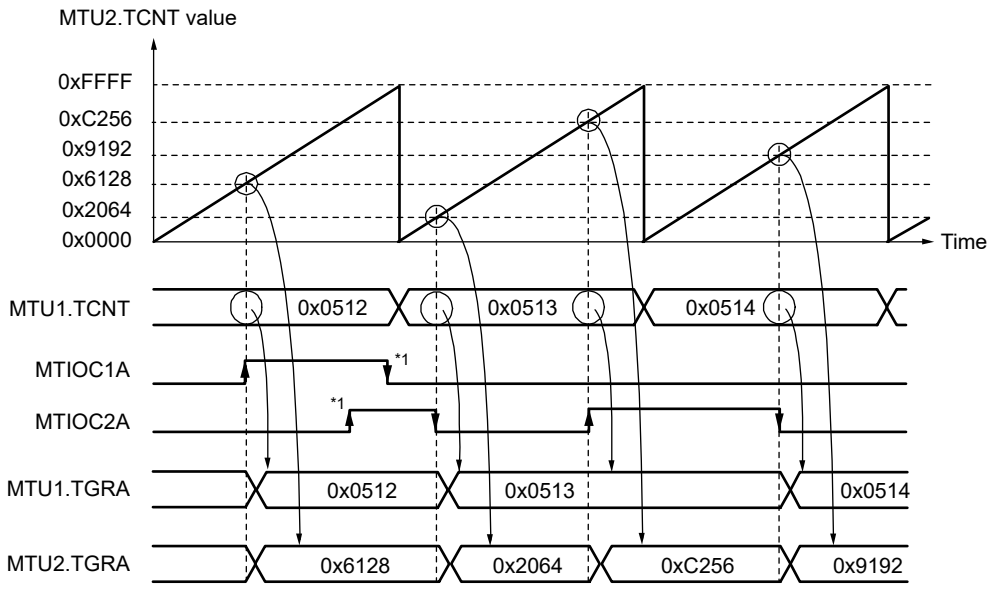
18.4.4.4 Cascaded Operation Example (c)

Figure 18.24 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.



Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 18.24 Cascaded operation example (c)

18.4.4.5 Cascaded Operation Example (d)

Figure 18.25 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

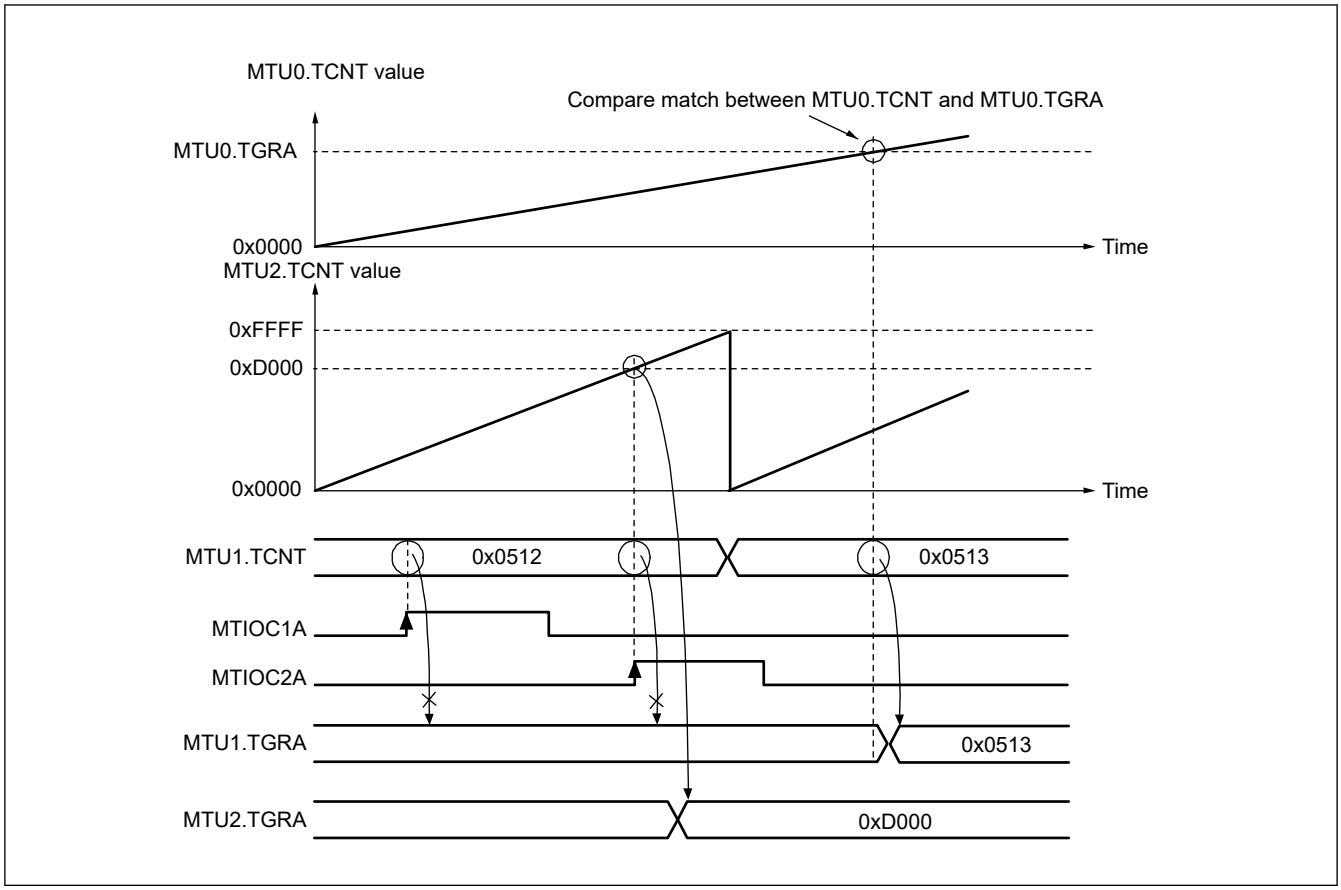


Figure 18.25 Cascaded operation example (d)

18.4.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM period can be specified in that register.

Every channel except MTU5 and MTU8 can be set to PWM mode independently. Channels set to PWM mode can perform synchronous operation with each other or other channels set to any other mode.

There are two PWM modes as described below.

(1) PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

(2) PWM Mode 2

PWM waveform output is generated using one TGR as the period register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a period register compare match, the initial value set in TIOR is output from each pin. If the values set in the period and duty registers are identical, the output value does not change even when a compare match occurs.

Up to eight phases of PWM waveforms can be output by combining synchronous clearing of channels that cannot be set to PWM mode 2 as synchronous operation.

The correspondence between PWM output pins and registers is shown in Table 18.62.

Table 18.62 PWM output registers and output pins

Channel	Register	Output pins	
		PWM mode 1	PWM mode 2
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM period is set.

18.4.5.1 Example of PWM Mode Setting Procedure

Figure 18.26 shows an example of the PWM mode setting procedure.

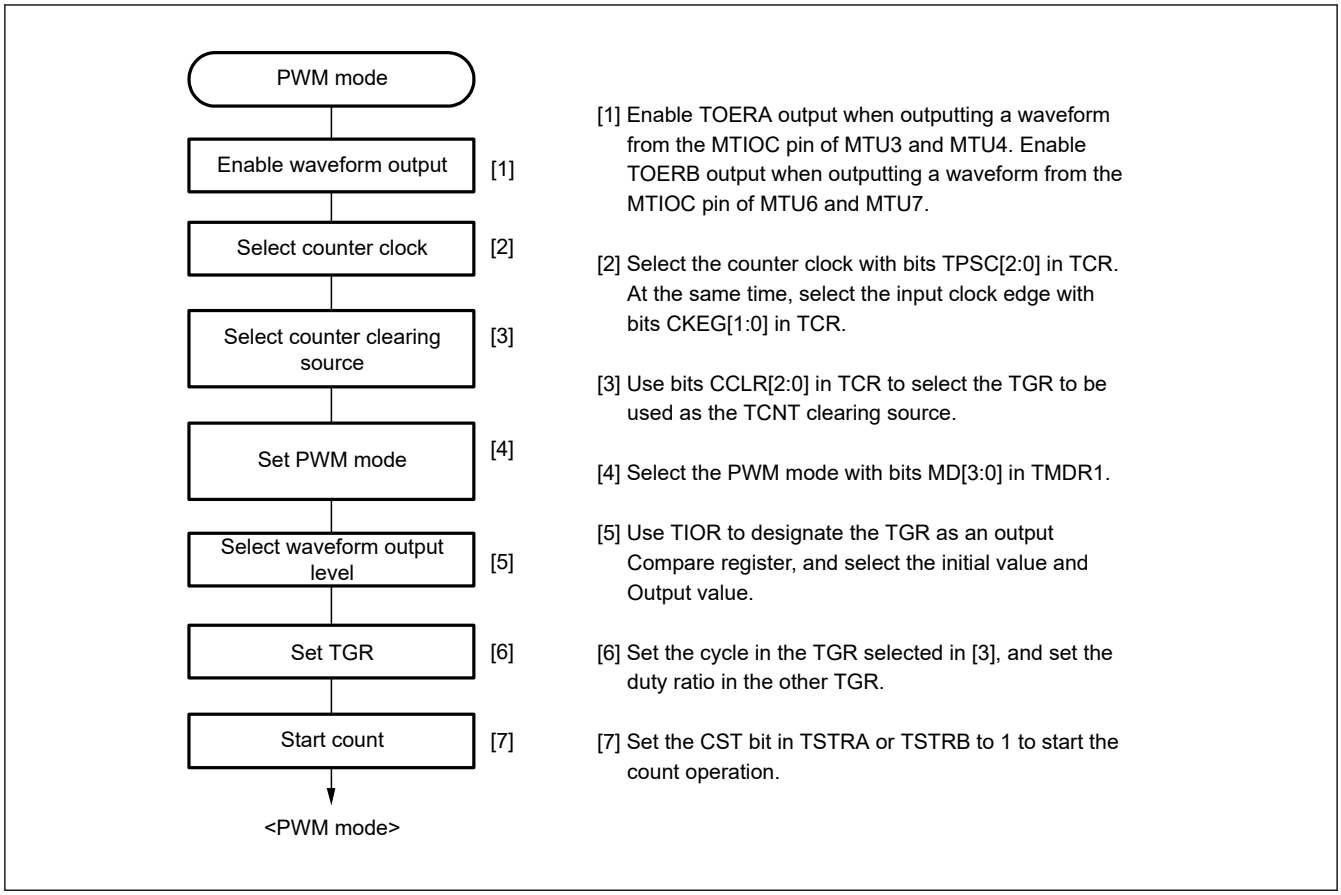

Figure 18.26 Example of PWM mode setting procedure

18.4.5.2 Examples of PWM Mode Operation

Figure 18.27 shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the period, and the value set in TGRB is used as the duty ratio.

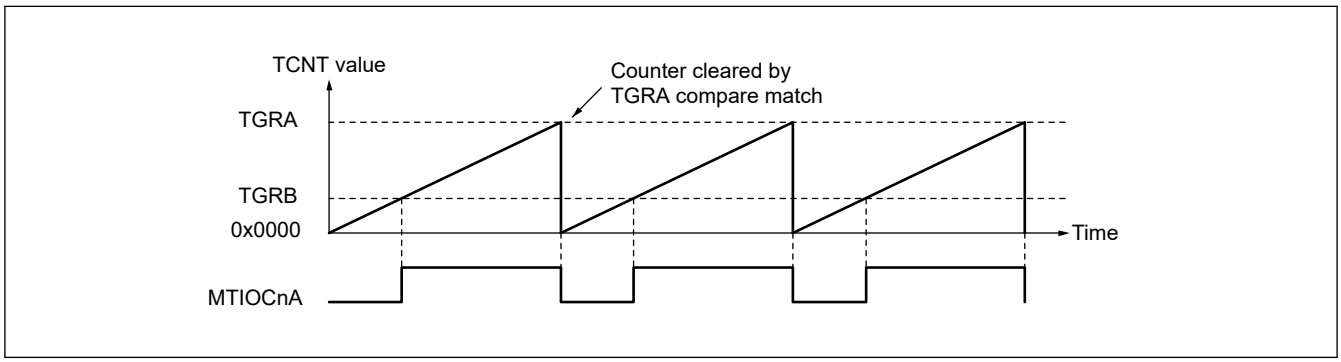

Figure 18.27 Example of PWM mode 1 operation (n = 0 to 4, 6, 7)

Figure 18.28 shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the period, and the values set in the other TGRs are used as the duty ratio.

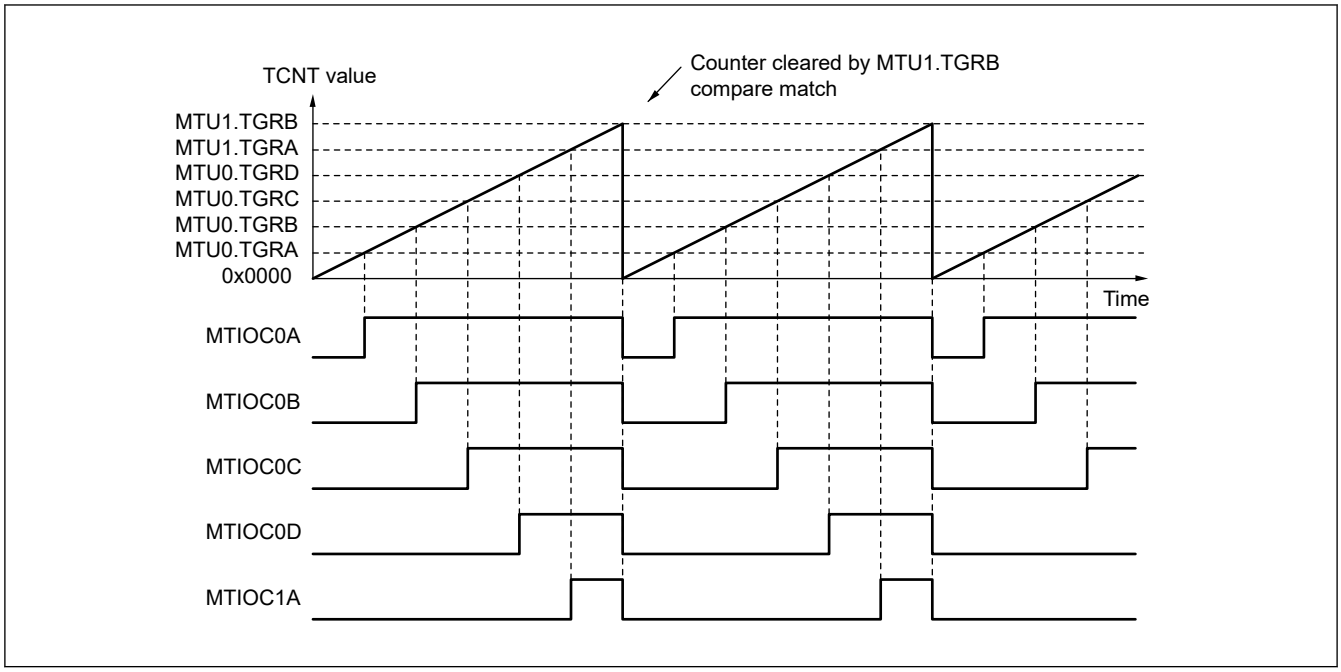

Figure 18.28 Example of PWM mode 2 operation

Figure 18.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1.

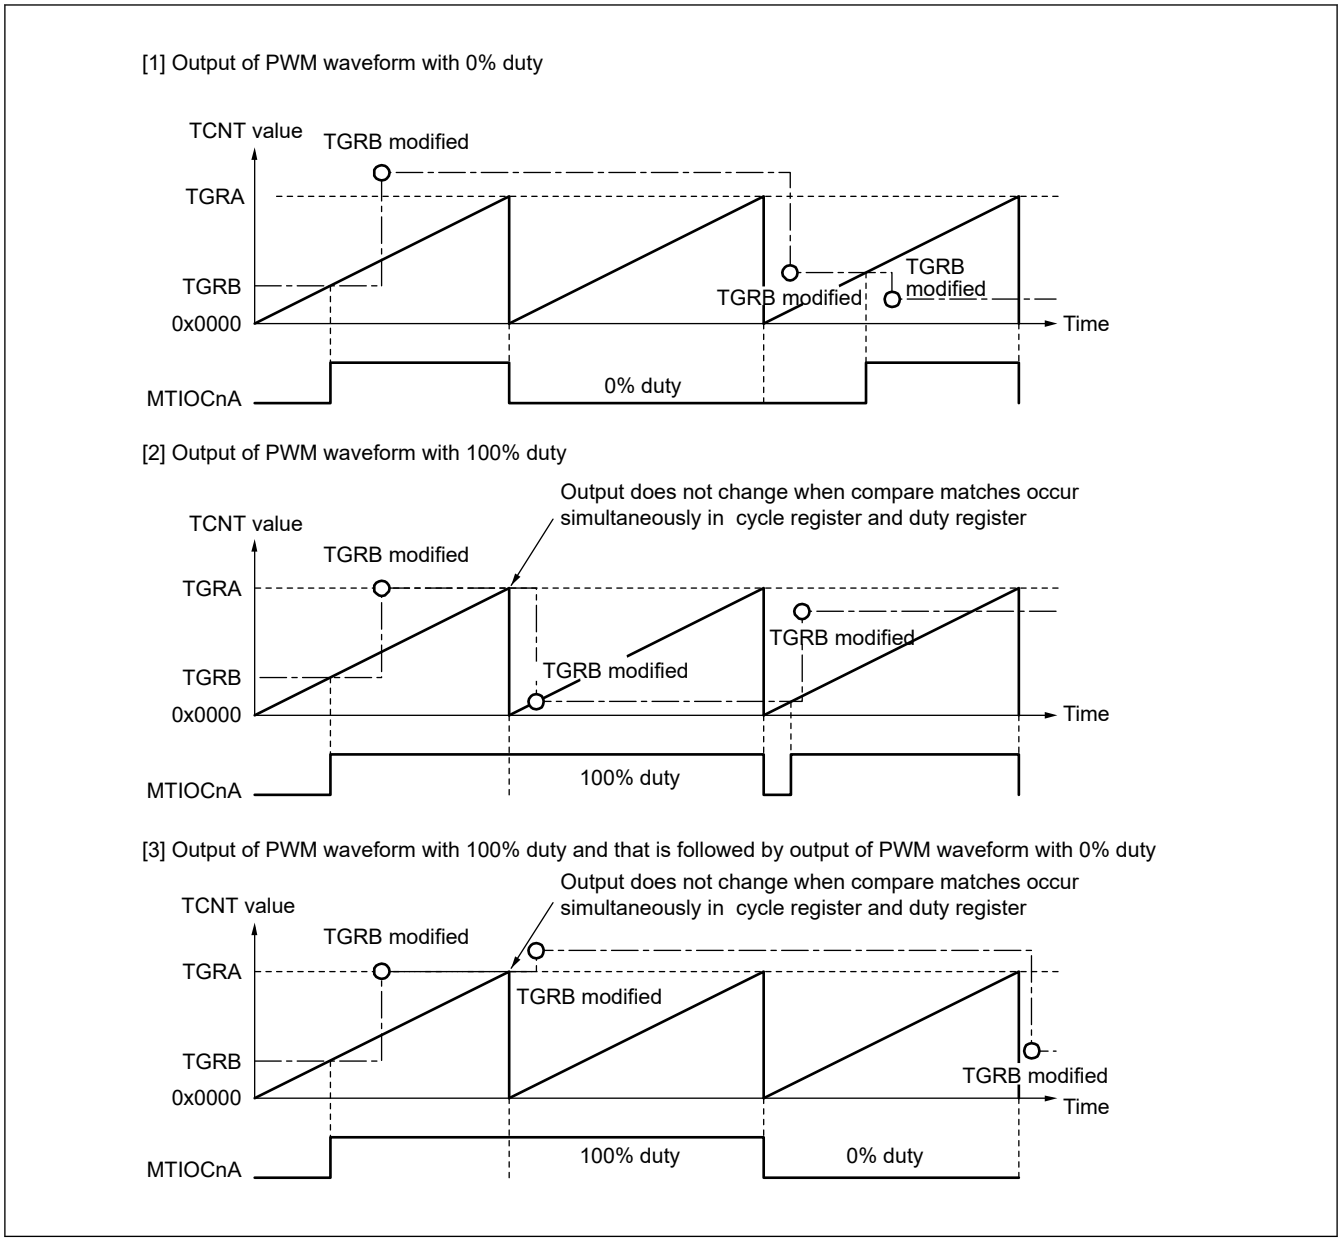

Figure 18.29 Examples of PWM mode operation (PWM waveform output with 0% duty and 100% duty) (n = 0 to 4, 6, 7)

18.4.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 18.63 lists the external clock input pins to be connected in each phase counting mode.

Table 18.63 Clock input pins in phase counting mode

Phase counting mode	TMDR3.PHCKSEL bit	External clock input pins	
		A-phase	B-phase
MTU1 16-bit phase counting mode	x (Don't care)	MTCLKA	MTCLKB
MTU2 16-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD
Cascade connection 32-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD

18.4.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0], TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

When an overflow occurs while TCNT is counting up and the corresponding TIER.TCIEV bit is 1, a TCIV interrupt is generated. When an underflow occurs while TCNT is counting down and the corresponding TIER.TCIEU bit is 1, a TCIU interrupt is generated.

The TSR.TCFD flag is the count direction flag. Read the TCFD flag to check whether TCNT is counting up and down.

18.4.6.1.1 Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 18.30 shows an example of the 16-bit phase counting mode setting procedure.

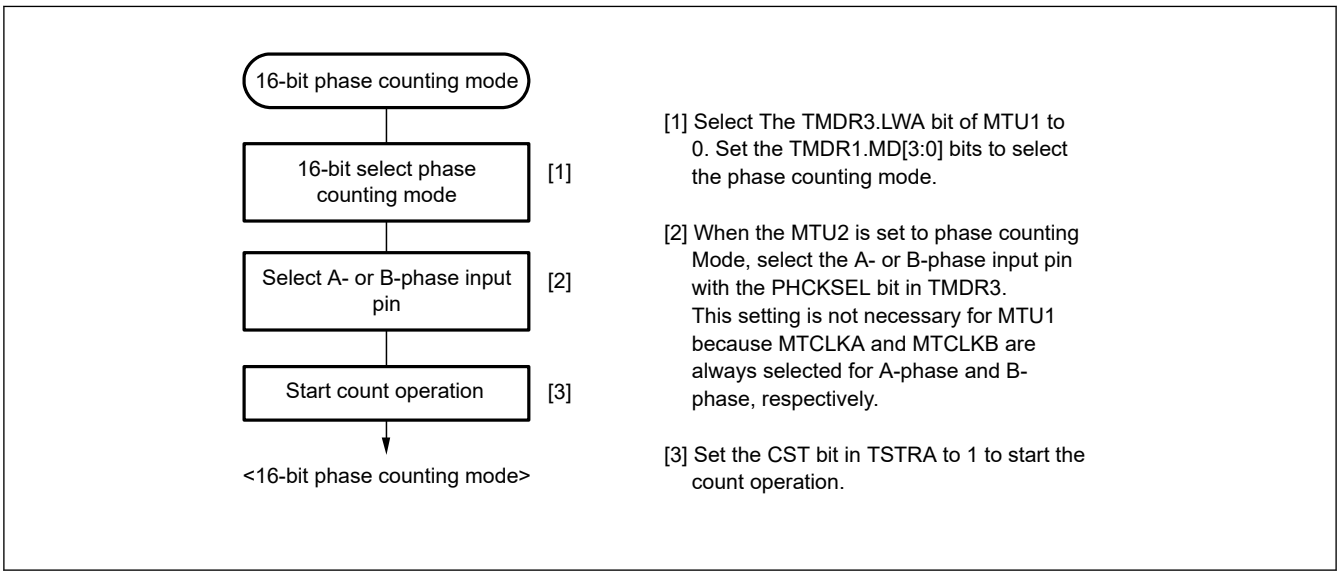

Figure 18.30 Example of 16-bit phase counting mode setting procedure

18.4.6.1.2 Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(1) Phase Counting Mode 1

Figure 18.31 shows an example of operation in phase counting mode 1, and Table 18.64 summarizes the TCNT upcounting and down-counting conditions.

18.4.6.1.3 16-Bit Phase Counting Mode Application Example

Figure 18.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control period and position control period.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control periods.

This procedure enables the accurate detection of position and speed.

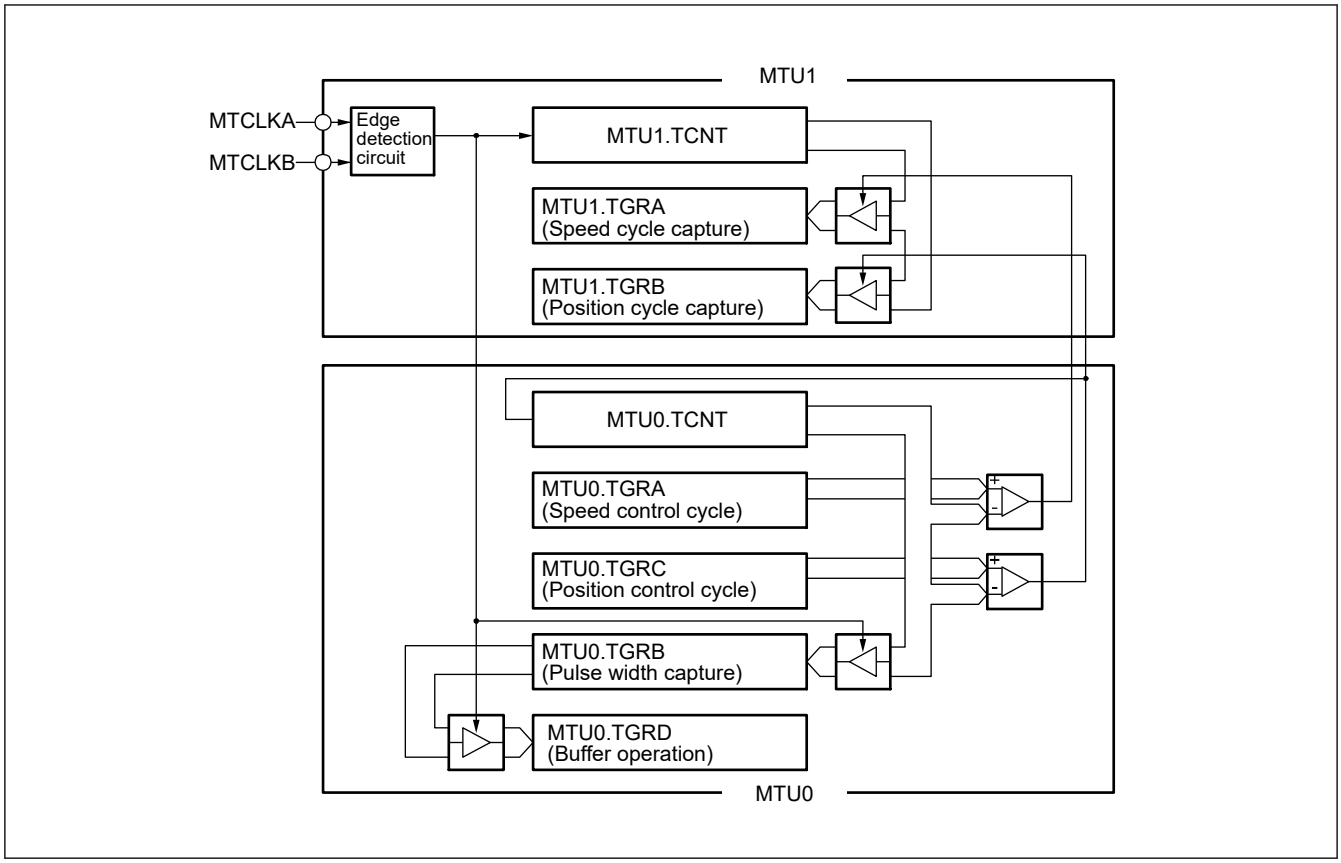

Figure 18.41 16-bit phase counting mode application example

18.4.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in Figure 18.42. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See Figure 18.43 for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See Table 18.63 for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

An input capture can also be generated using a Z-phase signal; thus angular velocity can be measured using the captured value in the general register.

Furthermore, MTU8 can be used as a channel for measuring a control period interval, and a compare match signal can be output at a control period interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a control period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring a Z-phase signal pulse, the compare match signal of the MTU8.TGRC register can be output as a capture signal or clear signal to MTU0 or MTU5, thus the Z-phase count at a control period interval can be measured.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of the MTU8.TGRD register, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the MTU8.TGRD register should be set to buffer operation.

See section 18.4.4. Cascaded Operation, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

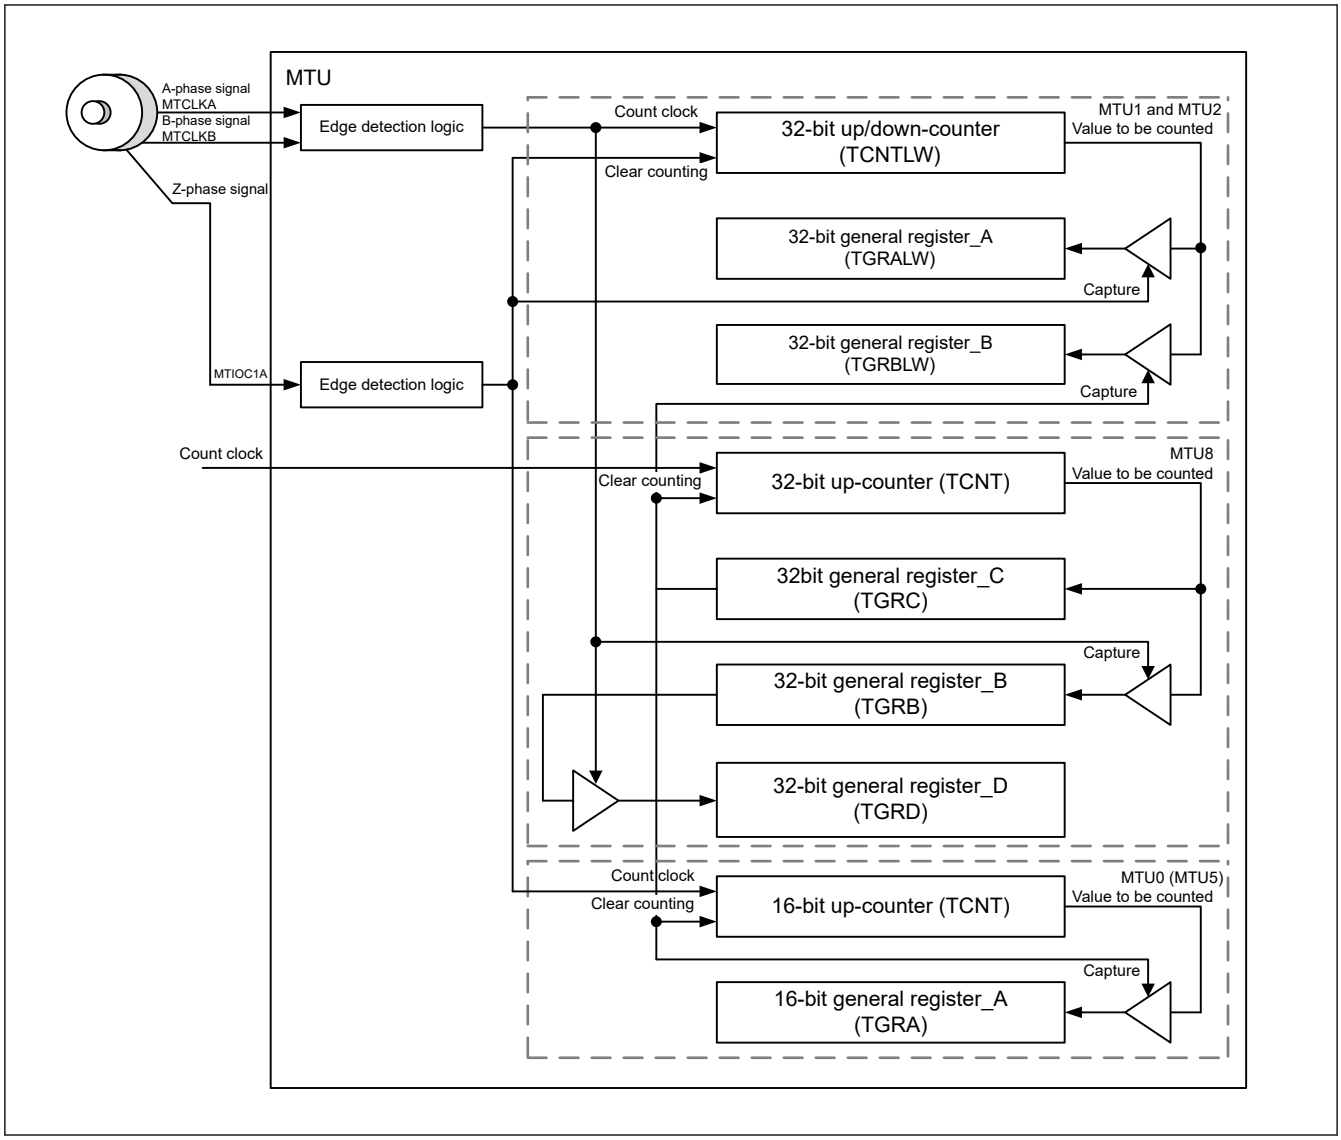

Figure 18.42 Block diagram for operation in cascade connection 32-bit phase counting mode

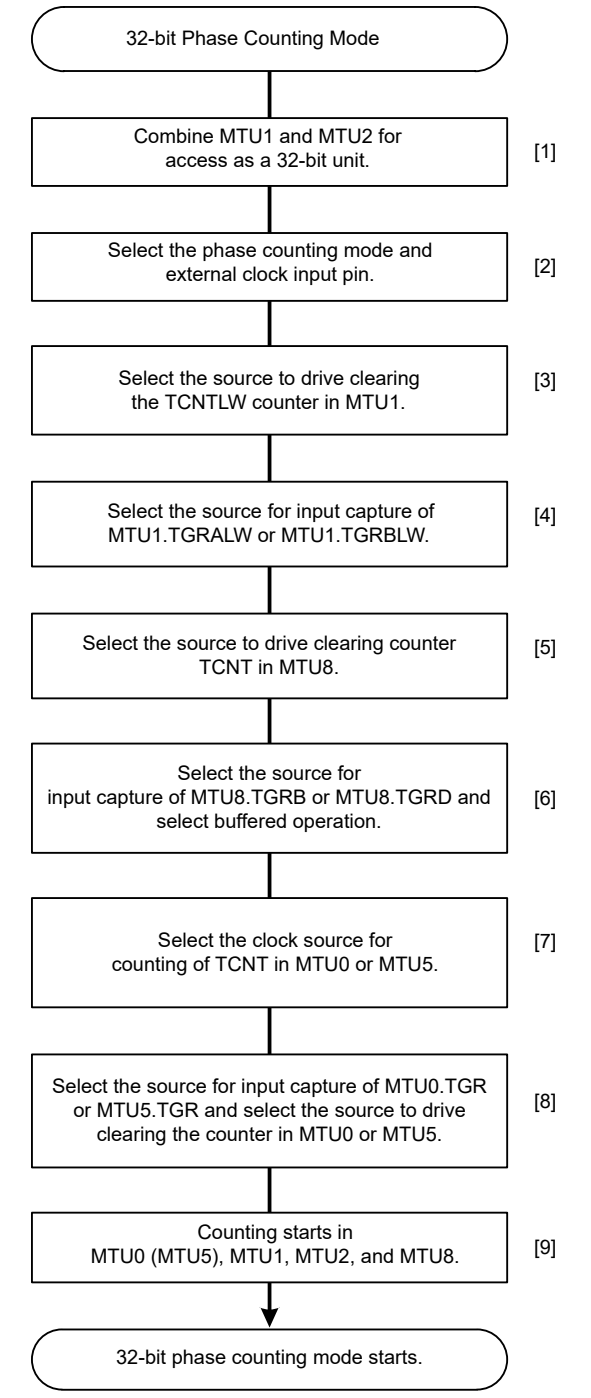
18.4.6.2.1 Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 18.43 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.



[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU2 for access as a 32-bit unit.

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits in MTU1.TCR to 001b to select input capture of MTU1.TGRALW as the source of the signal to drive clearing counter TCNTLW in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock source for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b.
(When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the TSTRA bit to 00001111b.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note: When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR1, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 18.43 Procedure for setting cascade connection 32-bit phase counting mode

18.4.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, six phases of positive and negative PWM waveforms (12 phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 3 and 6 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 18.69 shows the PWM output pins used. Table 18.70 shows the settings of the registers.

Table 18.69 Output pins for reset-synchronized PWM mode

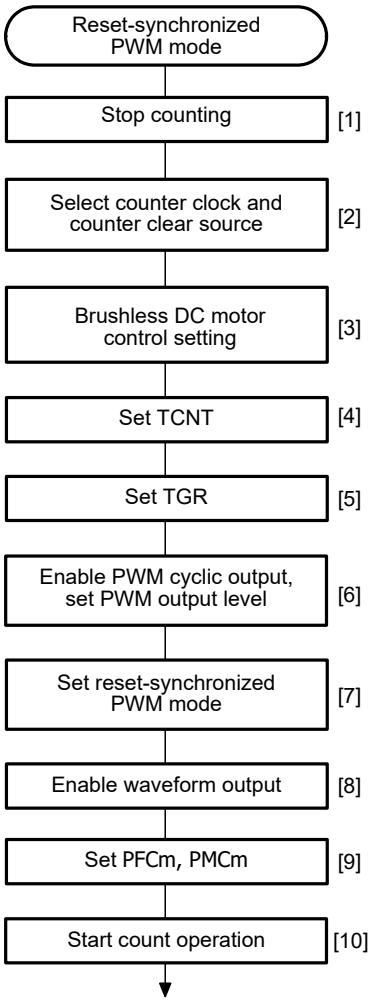
Channel	Output pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 18.70 Register settings for reset-synchronized PWM mode

Register	Setting
MTU3.TCNT	Initial setting (0x0000)
MTU4.TCNT	Initial setting (0x0000)
MTU3.TGRA	Set the count period for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (0x0000)
MTU7.TCNT	Initial setting (0x0000)
MTU6.TGRA	Set the count period for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

18.4.7.1 Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 18.44 shows an example of procedure for setting the reset-synchronized PWM mode.



[1] Clear the CST3 and CST4 bits in TSTRA to 0 to stop the TCNT operation. Specify the reset-synchronized PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set bits TPSC[2:0] and CKEG[1:0] in MTU3.TCR to select the counter clock and clock edge for MTU3. Set bits CCLR[2:0] to select TGRA compare match as a counter clear source.

[3] When performing brushless DC motor control, set bit BDC in the timer gate control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set MTU3.TCNT and MTU4.TCNT to 0x0000.

[5] MTU3.TGRA is the cycle register. Set the waveform cycle value in MTU3.TGRA. Set the transition timing of the PWM output waveforms in MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB. Set times within the compare match range of MTU3.TCNT.

X = MTU3.TGRA (X: Set value)

[6] Enable or disable toggle output synchronized with the PMW cycle using bit PSYE in TOCR1A, and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 17.4.

[7] Set bits MD[3:0] in MTU3.TMDR1 to 1000b to select the reset-synchronized PWM mode. In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRB (BFB = 1) when necessary. Set the MTU4.TMDR1 to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the enabling/disabling of the PWM waveform output pin in TOERA.

[9] Set the Port Function Control register (PFCm) and the Port Mode Control registers (PMCm) of the I/O ports.

[10] Set the CST3 bit in the TSTRA to 1 to start the count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT = MTU3.TGRA = X by setting X = MTU3.TGRA for example, period = duty ratio.

Figure 18.44 Procedure for selecting reset-synchronized PWM mode

18.4.7.2 Example of Reset-Synchronized PWM Mode Operation

Figure 18.45 shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from 0x0000. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

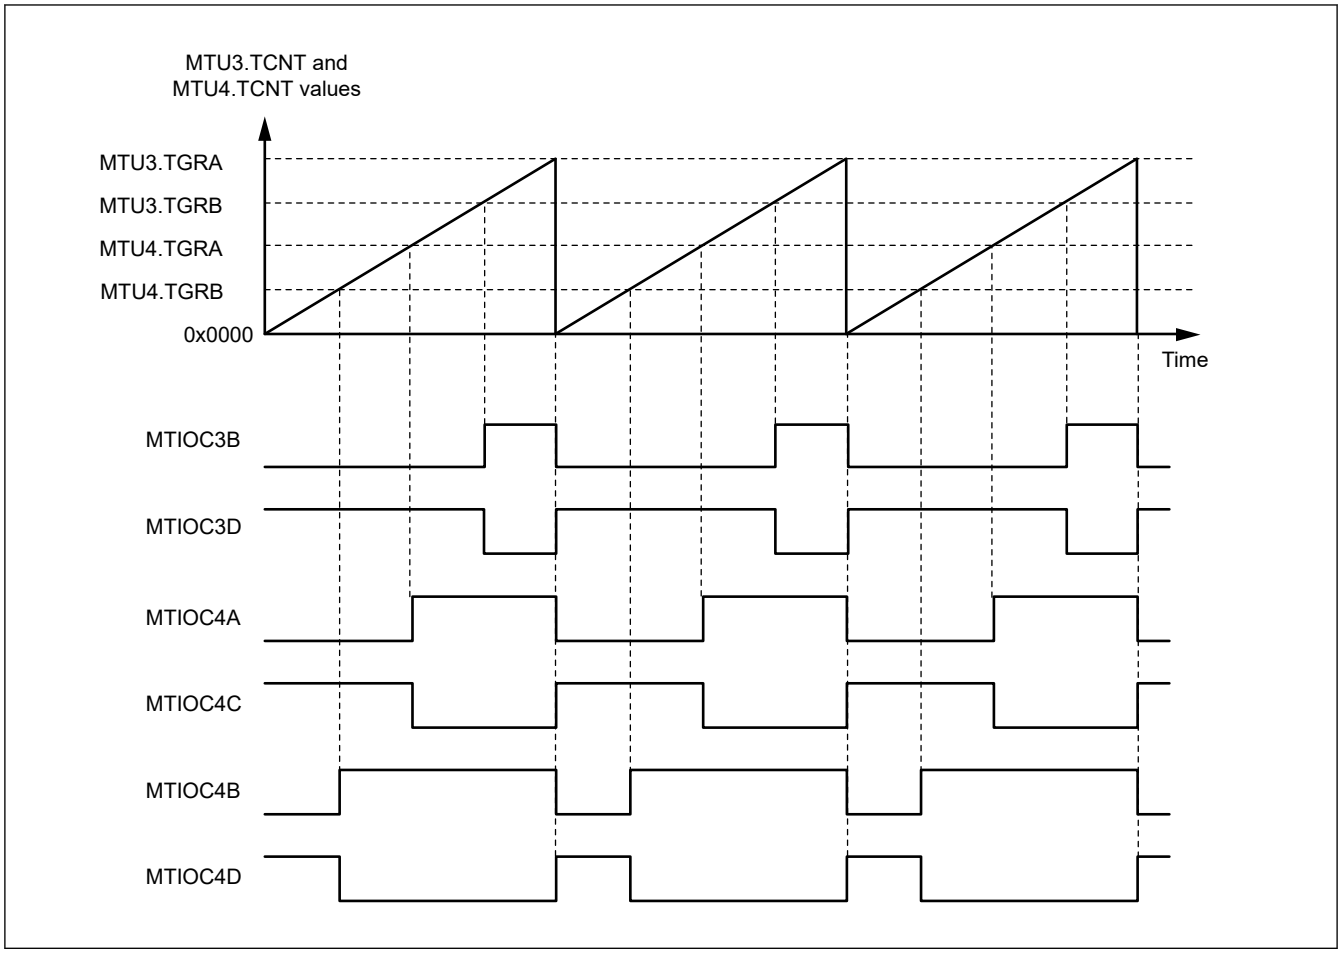


Figure 18.45 Example of reset-synchronized PWM mode operation (when OLSN = 1 and OLSP = 1 in MTU3.TOCR1A and MTU4.TOCR1A)

18.4.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM period.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 18.71 shows the PWM output pins used. Table 18.72 shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 18.71 Output pins for complementary PWM mode (1 of 2)

Channel	Output pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM period (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (non-overlapping negative-phase waveform of PWM output 1 — PWM output without non-overlapping interval is also available)

Table 18.71 Output pins for complementary PWM mode (2 of 2)

Channel	Output pin	Description
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (non-overlapping negative-phase waveform of PWM output 2 — PWM output without non-overlapping interval is also available)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (non-overlapping negative-phase waveform of PWM output 3 — PWM output without non-overlapping interval is also available)
MTU6	MTIOC6A	Toggle output synchronized with PWM period (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (non-overlapping negative-phase waveform of PWM output 4 — PWM output without non-overlapping interval is also available)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (non-overlapping negative-phase waveform of PWM output 5 — PWM output without non-overlapping interval is also available)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (non-overlapping negative-phase waveform of PWM output 6 — PWM output without non-overlapping interval is also available)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 18.72 Register settings for complementary PWM mode (1 of 3)

Channel	Counter/ register	Description	Read/write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*1
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier period + dead time)	Maskable by TRWERA setting*1
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*1
	TGRC	MTU3.TGRA buffer register	Readable/writable
	TGRD	PWM output 1/MTU3.TGRB buffer register	Readable/writable
	TGRE	MTU3.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU4	TCNT	Starts up-counting after being initialized to 0x0000	Maskable by TRWERA setting*1
	TGRA	PWM output 2 compare register	Maskable by TRWERA setting*1
	TGRB	PWM output 3 compare register	Maskable by TRWERA setting*1
	TGRC	PWM output 2/MTU4.TGRA buffer register	Readable/writable
	TGRD	PWM output 3/MTU4.TGRB buffer register	Readable/writable
	TGRE	MTU4.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU4.TGRB buffer register B (when double buffer function is used)	Readable/writable

Table 18.72 Register settings for complementary PWM mode (2 of 3)

Channel	Counter/ register	Description	Read/write from CPU
MTU6	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERB setting*2
	TGRA	Set MTU6.TCNT upper limit value (1/2 carrier period + dead time)	Maskable by TRWERB setting*2
	TGRB	PWM output 4 compare register	Maskable by TRWERB setting*2
	TGRC	MTU6.TGRA buffer register	Readable/writable
	TGRD	PWM output 4/MTU6.TGRB buffer register	Readable/writable
	TGRE	MTU6.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU7	TCNT	Starts up-counting after being initialized to 0x0000	Maskable by TRWERB setting*2
	TGRA	PWM output 5 compare register	Maskable by TRWERB setting*2
	TGRB	PWM output 6 compare register	Maskable by TRWERB setting*2
	TGRC	PWM output 5/MTU7.TGRA buffer register	Readable/writable
	TGRD	PWM output 6/MTU7.TGRB buffer register	Readable/writable
	TGRE	MTU7.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU7.TGRB buffer register B (when double buffer function is used)	Readable/writable
Timer dead time data register A (TDDRA)		Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)	Maskable by TRWERA setting*1
Timer dead time data register B (TDDRB)		Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)	Maskable by TRWERB setting*2
Timer cycle data register A (TCDRA)		Set MTU4.TCNT upper limit value (1/2 carrier period)	Maskable by TRWERA setting*1
Timer cycle data register B (TCDRB)		Set MTU7.TCNT upper limit value (1/2 carrier period)	Maskable by TRWERB setting*2
Timer cycle buffer register A (TCBRA)		TCDRA buffer register	Readable/writable
Timer cycle buffer register B (TCBRB)		TCDRB buffer register	Readable/writable
Timer subcounter A (TCNTSA)		Subcounter A for dead time generation	Read-only
Timer subcounter B (TCNTSB)		Subcounter B for dead time generation	Read-only
Temporary register 1A (TEMP1A)		PWM output 1/MTU3.TGRB temporary register A	Not readable/writable
Temporary register 1B (TEMP1B)		PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 2A (TEMP2A)		PWM output 2/MTU4.TGRA temporary register A	Not readable/writable
Temporary register 2B (TEMP2B)		PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 3A (TEMP3A)		PWM output 3/MTU4.TGRB temporary register A	Not readable/writable
Temporary register 3B (TEMP3B)		PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 4A (TEMP4A)		PWM output 4/MTU6.TGRB temporary register A	Not readable/writable

Table 18.72 Register settings for complementary PWM mode (3 of 3)

Channel	Counter/ register	Description	Read/write from CPU
Temporary register 4B (TEMP4B)		PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 5A (TEMP5A)		PWM output 5/MTU7.TGRA temporary register A	Not readable/writable
Temporary register 5B (TEMP5B)		PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 6A (TEMP6A)		PWM output 6/MTU7.TGRB temporary register A	Not readable/writable
Temporary register 6B (TEMP6B)		PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used)	Not readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).
Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

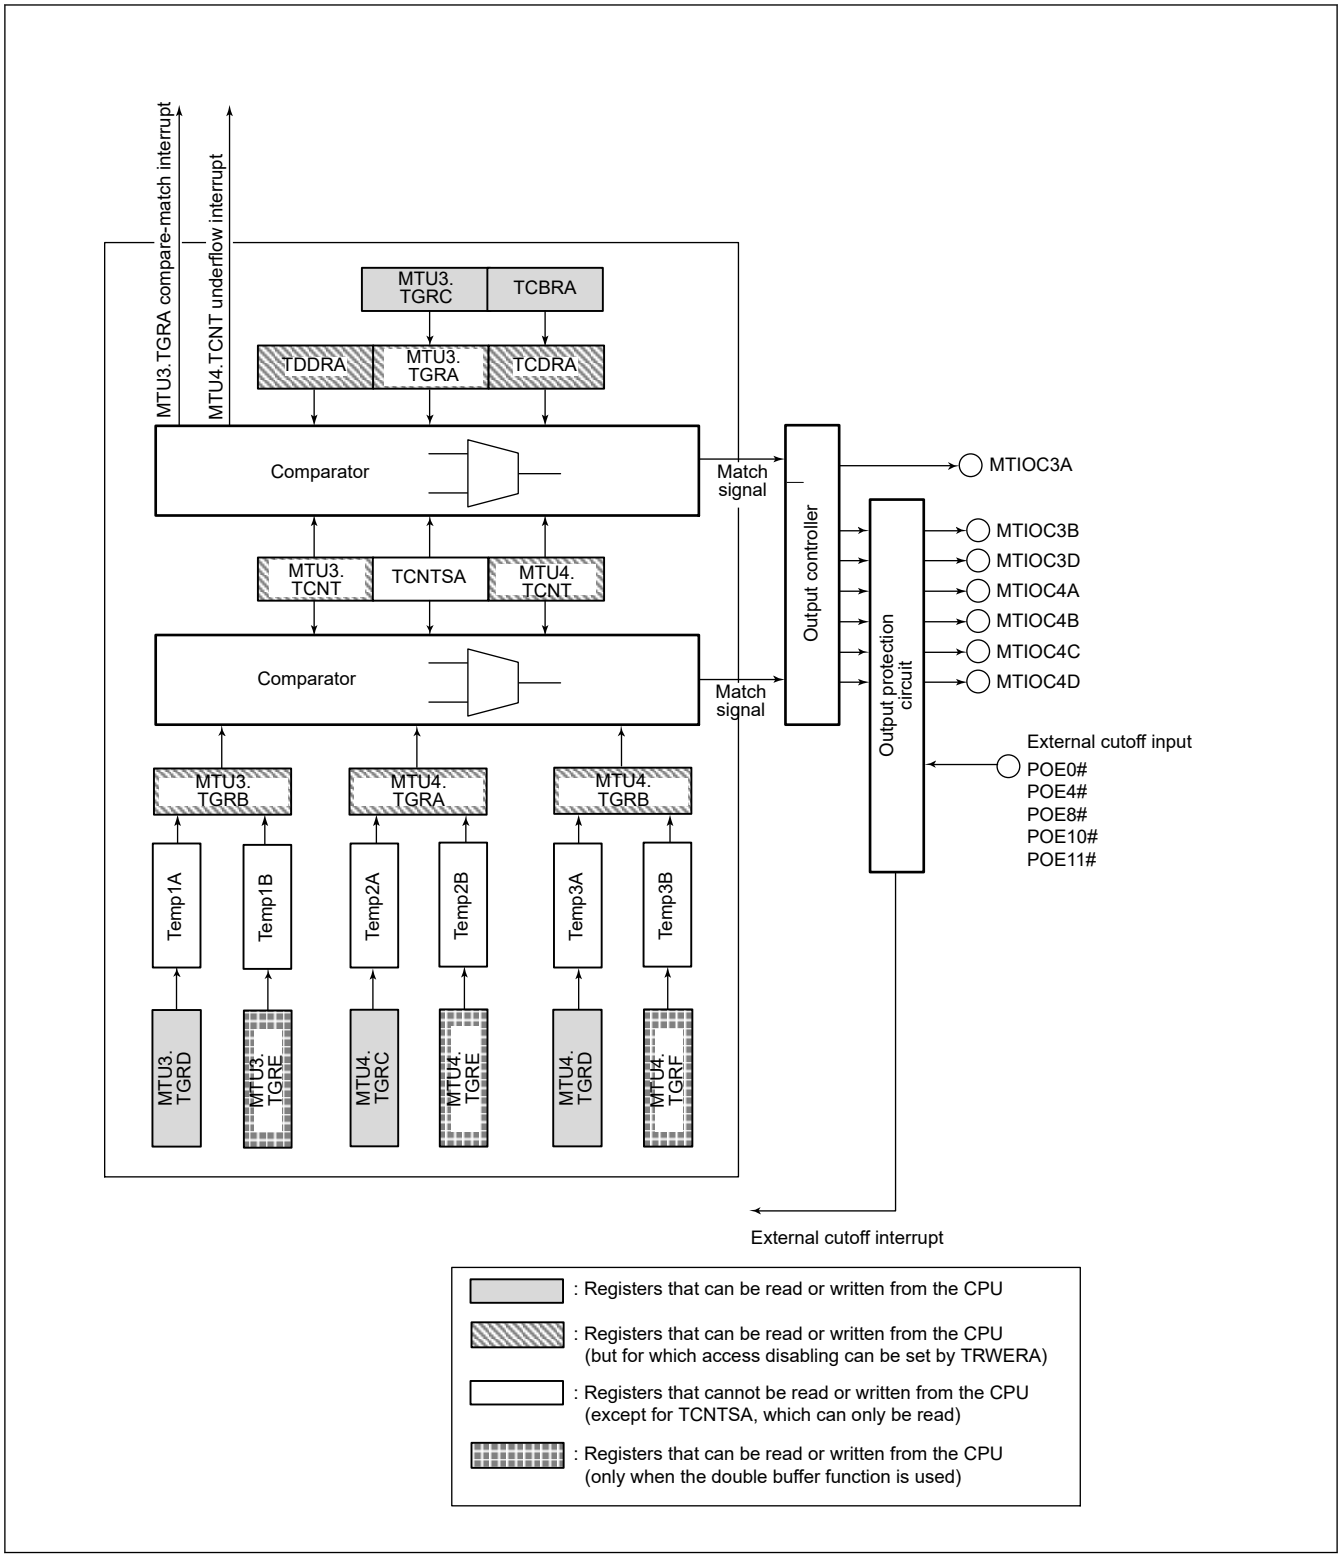

Figure 18.46 Block diagram of MTU3 and MTU4 in complementary PWM mode

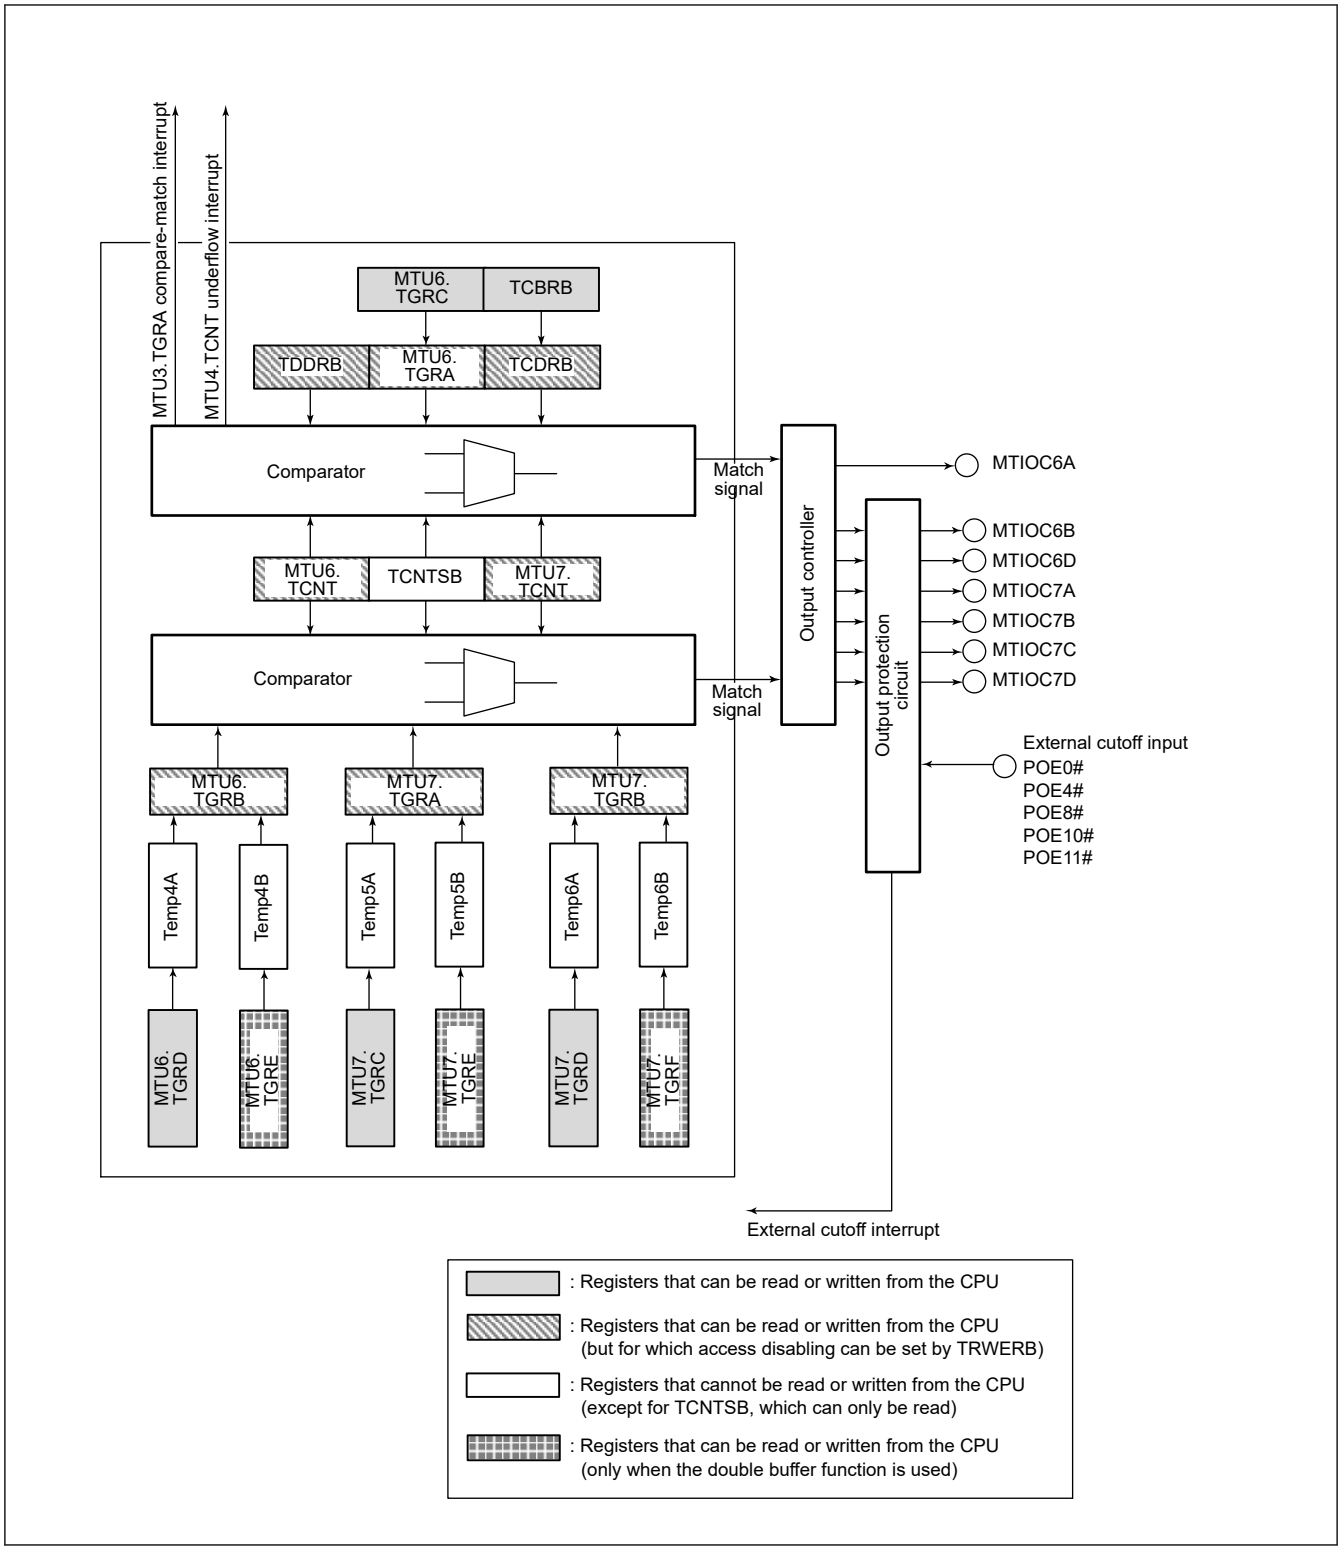

Figure 18.47 Block diagram of MTU6 and MTU7 in complementary PWM mode

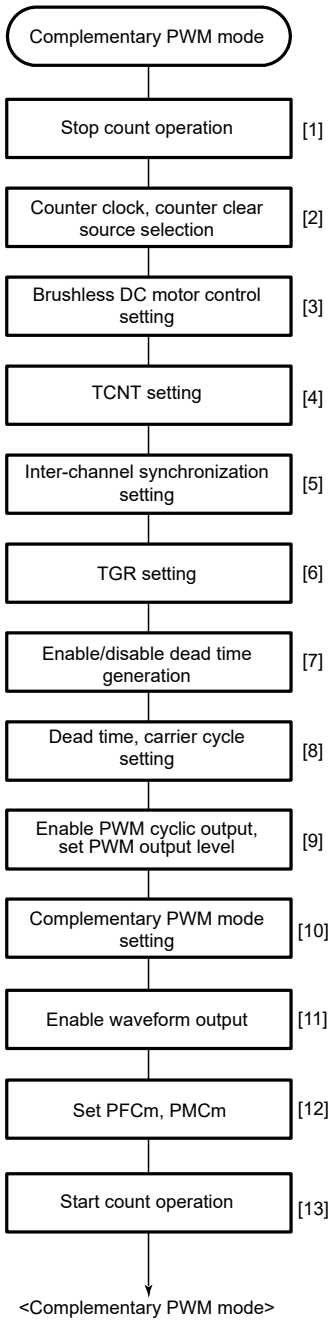
18.4.8.1 Example of Complementary PWM Mode Setting Procedure

Figure 18.48 shows an example of the complementary PWM mode setting procedure.



[1] Clear bits CST3 and CST4 in the Timer Start register (TSTRA) to 0 to stop timer counter (TCNT) operation. Specify complementary PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set the same counter clock and clock edge for MTU3 and MTU4 with bits TPSC[2:0] and bits CKEG[1:0] in the Timer Control Register (TCR). Use bits CCLR[2:0] to set synchronous clearing only when restarting by synchronous clearing with another channel during complementary PWM mode operation.

[3] When performing brushless DC motor control, set bit BDC in the Timer Gate Control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set the dead time in MTU3.TCNT. Set MTU4.TCNT to 0x0000.

[5] Set only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, synchronize the channel generating the synchronous clear with MTU3 and MTU4 using the Timer Synchronous register (TSYRA).

[6] Set the output PWM duty cycles in the Duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and Buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD). Be sure to set the same value in each pair of Duty register and Buffer register.
Only when using the double buffer function, set the output PWM duty value - 1 in the Buffer registers (MTU3.TGRE, MTU4.TGRE, MTU4.TGRF).

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the Timer Dead Time Enable register (TDERA) so that no dead time is generated.

[8] Set the dead time in the Timer Dead Time register (TDDRA), 1/2 the carrier cycle in the Timer Cycle Data register (TCDRA) and Timer Cycle Buffer register (TCBRA), and 1/2 the carrier cycle plus the dead time in MTU3.
TGRA and MTU3.TGRC. When no dead time generation is selected, set 1 in TDDRA and 1/2 the carrier cycle + 1 in MTU3.TGRA and MTU3.TGRC.

[9] Enable or disable toggle output synchronized with the PWM cycle using bit PSYE in the timer output control register 1 (TOCR1A), and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 17.4.

[10] Select complementary PWM mode in the Timer Mode register 1 (MTU3.TMDR1). In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRB (BFB = 1) when necessary. Enable the double buffer operation with the TMDR2 register only when the double buffer function is used.

[11] Set enabling/disabling of PWM waveform output pin output in the Timer Output Master Enable register (TOERA).

[12] Set the Port Function Control register (PFCm) and Port Mode Control registers (PMCm) of the I/O ports.

[13] Set bits CST3 and CST4 in TSTRA to 1 simultaneously to start the count operation.

Figure 18.48 Example of complementary PWM mode setting procedure

18.4.8.2 Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Figure 18.49 shows counter operation in complementary PWM mode (MTU3 and MTU4), and Figure 18.50 shows an example of operation in complementary PWM mode.

(1) Counter Operation

In complementary PWM mode, three counters—MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) —in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST bit in TSTRA (TSTRB) is 0. When the CST bit is set to 1, MTU3.TCNT (MTU6.TCNT)

counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches 0x0000, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

MTU4.TCNT (MTU7.TCNT) should be initialized to 0x0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching 0x0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way.

MTU4.TCNT (MTU7.TCNT) should be initialized to 0x0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA).

On reaching 0x0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches 0x0000, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) becomes 0x0000 and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

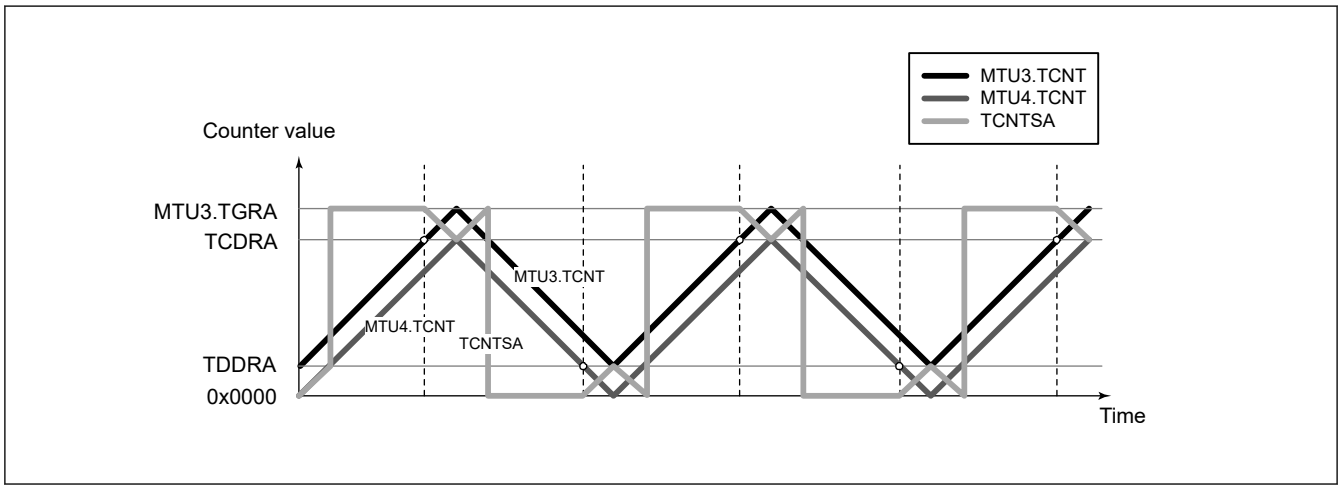


Figure 18.49 Count operation in complementary PWM mode (MTU3 and MTU4)

(2) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used for each unit. Figure 18.50 shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, see (19) Double Buffer Function in Complementary PWM Mode.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer period registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register when TCNTSA (TCNTSB) for which the Tb interval ends matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up, or 0x0000 while counting down.

The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 18.50 shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in Figure 18.50), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

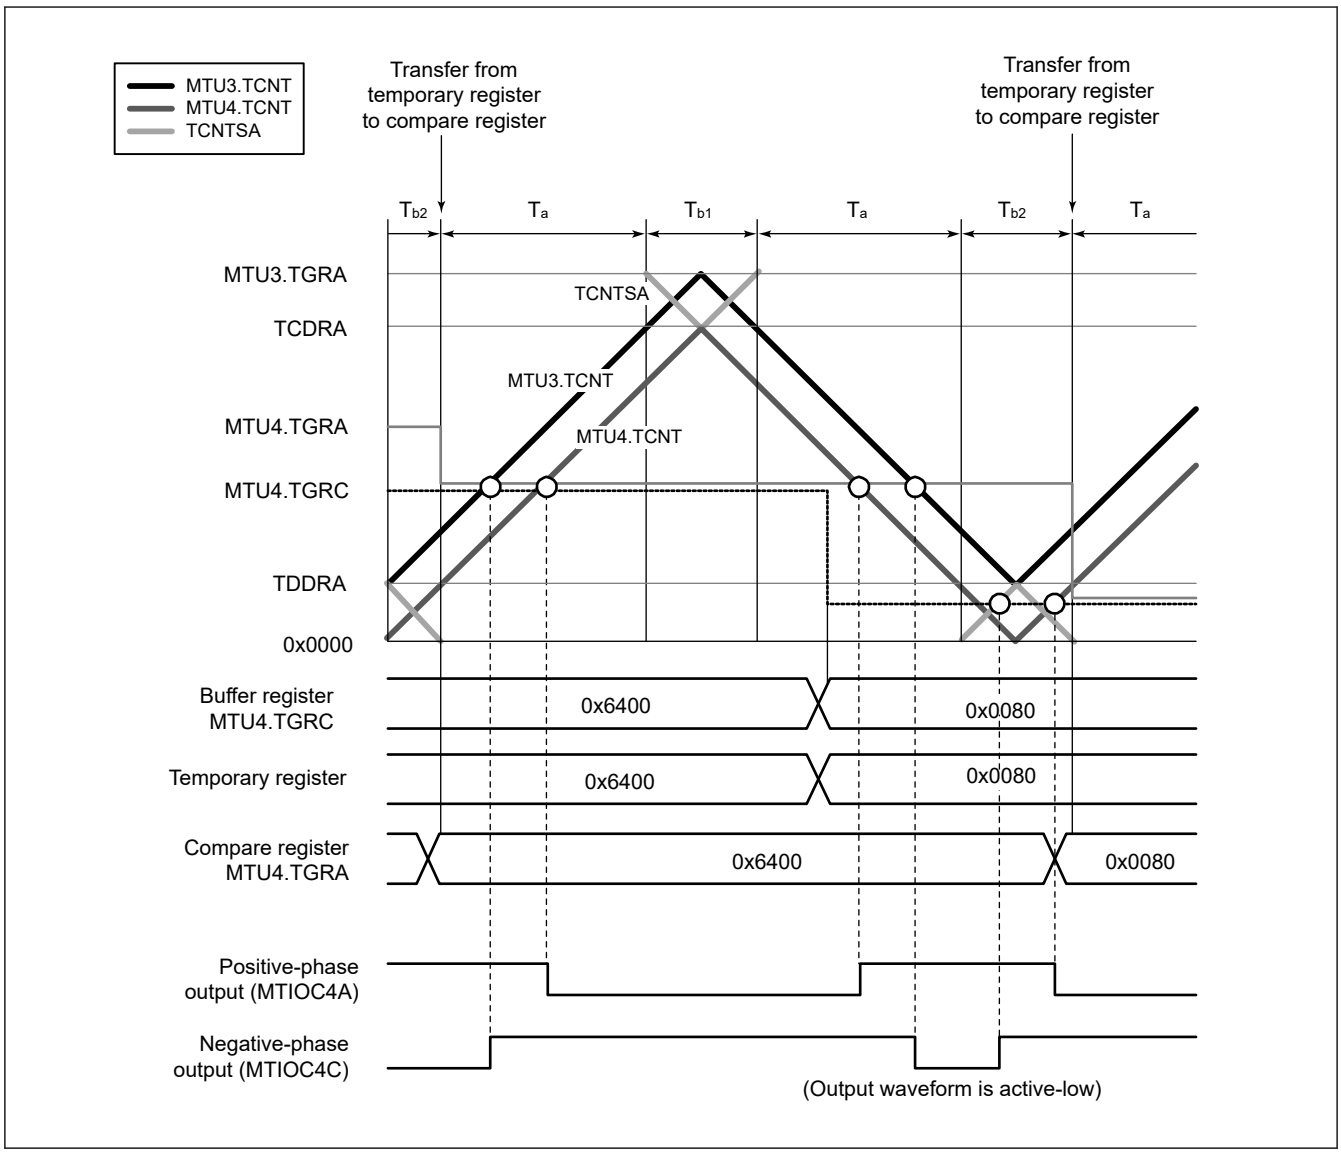

Figure 18.50 Example of operation in complementary PWM mode (MTU3 and MTU4)

(3) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM carrier period + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM carrier period. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be set to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier period + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set the respective (initial PWM duty − 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to 0x0000 before setting complementary PWM mode.

Table 18.73 Registers and counters requiring initial setting

Register and counter	Setting
TOCR1A, TOCR2A, TOCR1B, TOCR2B	PWM output level
MTU3.TGRC MTU6.TGRC	1/2 PWM carrier period + dead time Td (1/2 PWM carrier period + 1 when dead time generation is disabled by TDERA or TDERB)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by TDERA or TDERB)
TCBRA, TCBRB	1/2 PWM carrier period
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio − 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	0x0000

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM carrier period set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM carrier period + 1.

(4) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output.

Complementary PWM mode should be cleared before setting or changing output levels.

(5) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(6) Dead Time Suppressing

Dead time generation is suppressed by setting the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be set to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU3.TGRC (MTU6.TGRA and MTU6.TGRC) should be set to 1/2 PWM carrier period + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. Figure 18.51 shows an example of operation without dead time (MTU3 and MTU4).

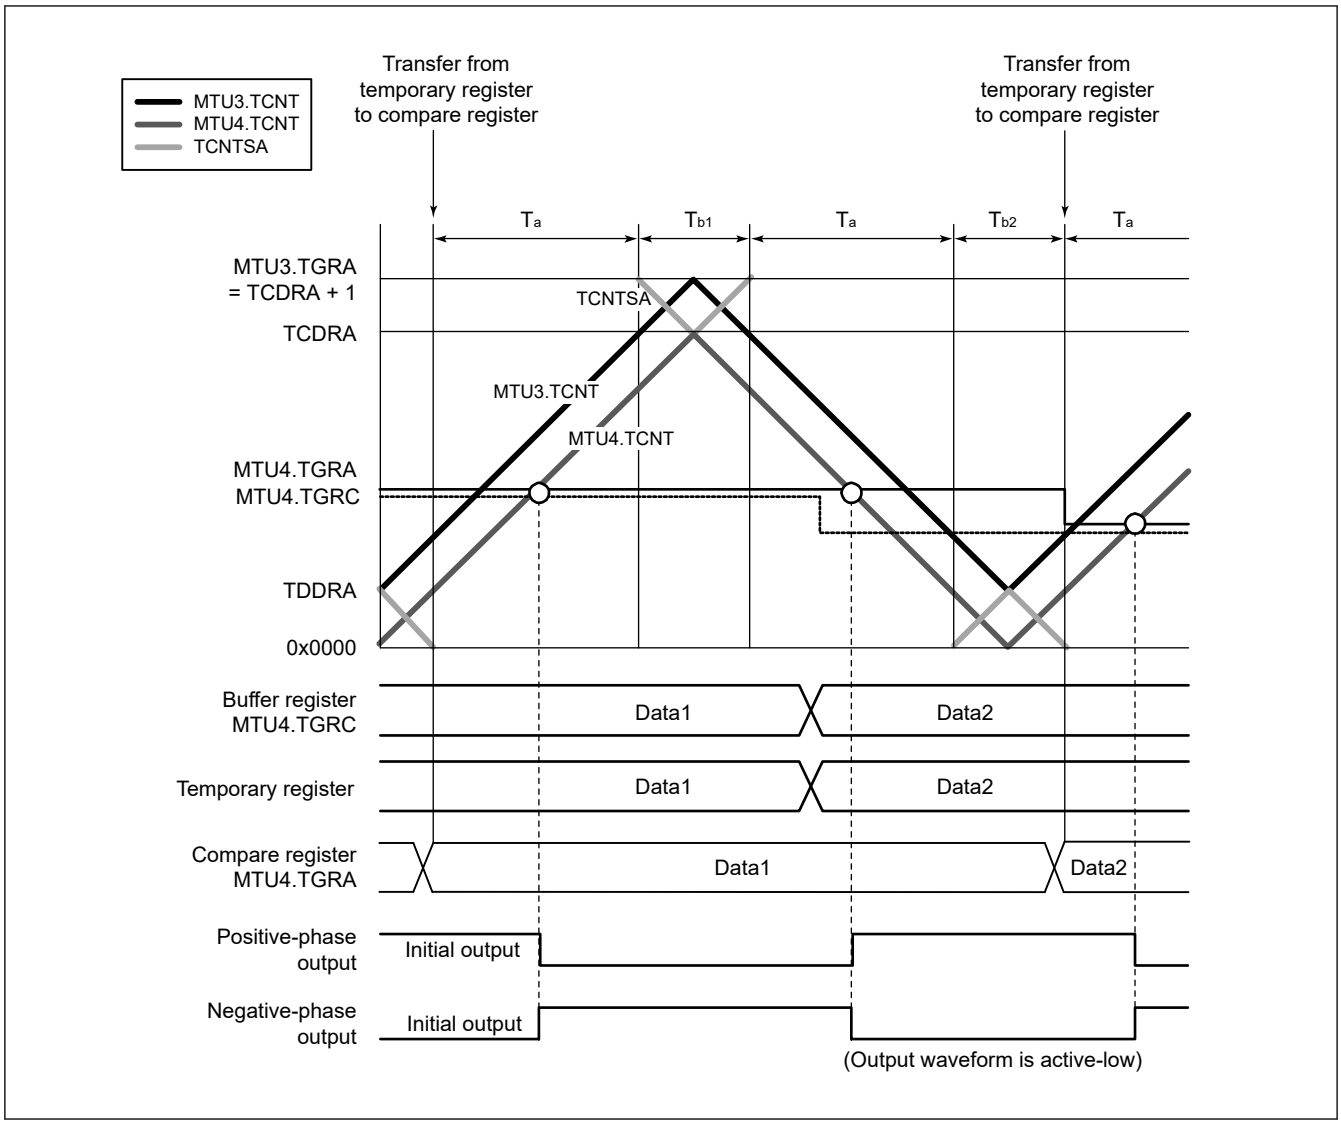

Figure 18.51 Example of operation without dead time (MTU3 and MTU4)

(7) PWM Cycle Setting

In complementary PWM mode, the PWM period is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting

Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). The values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with bits MD[3:0] in the timer mode register 1 (TMDR1).

The new PWM period is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. Figure 18.52 shows the operation when the PWM period is updated at the crest.

See the following section, (8) Register Data Updating, for the method of updating the data in each buffer register.

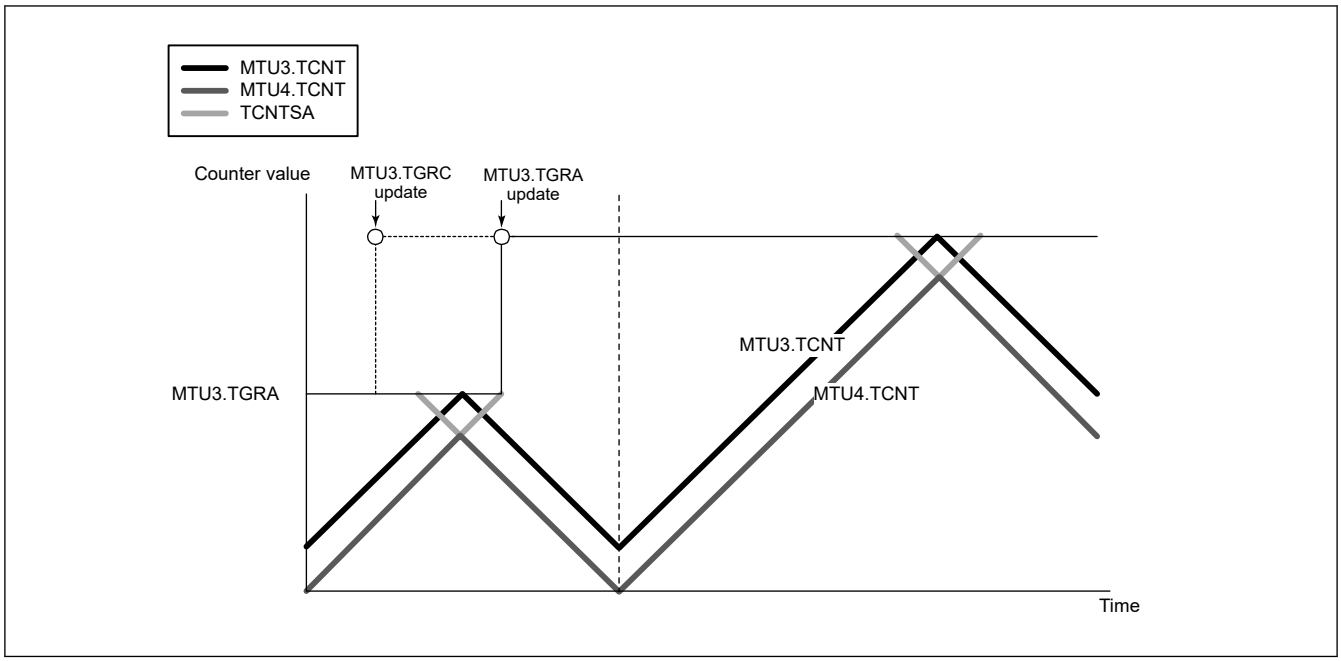

Figure 18.52 Example of PWM period updating (MTU3 and MTU4)

(8) Register Data Updating

In complementary PWM mode, the buffer register is used to update the data in a compare register. The update data can be written to the buffer register at any time. There are five registers (PWM duty and carrier cycle registers) that have buffer registers and can be updated during operation.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 18.53 shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See (19) Double Buffer Function in Complementary PWM Mode, for data updating when the double buffer function is used.

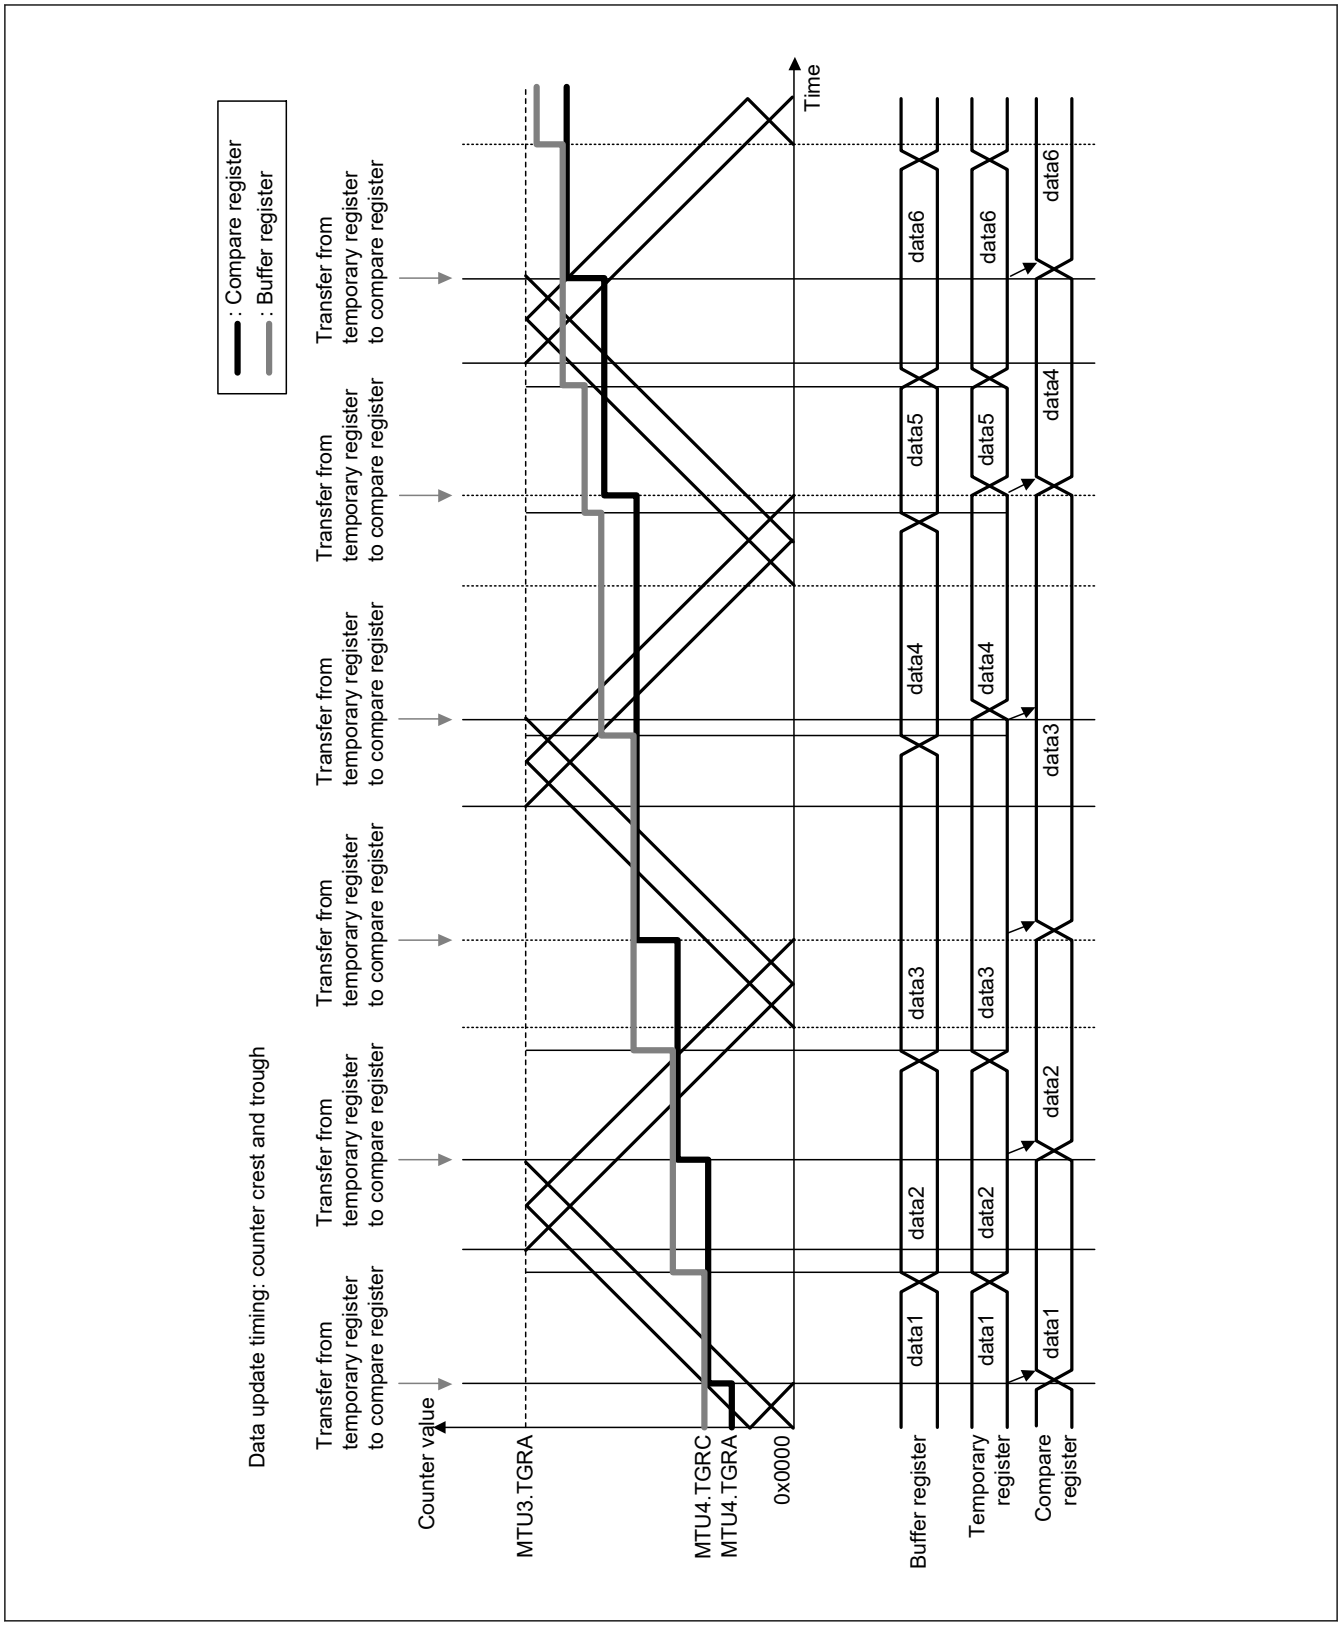

Figure 18.53 Example of data updating in complementary PWM mode (MTU3 and MTU4)

(9) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1N to OLS3N and OLS1P to OLS3P in timer output control register 2 (TOCR2A or TOCR2B).

This initial output is the non-active level of the PWM pulse and continues from when complementary PWM mode is set with the timer mode register 1 (TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the Timer dead time data register (TDDRA or TDDRB). Figure 18.54 shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA value is shown in Figure 18.55.

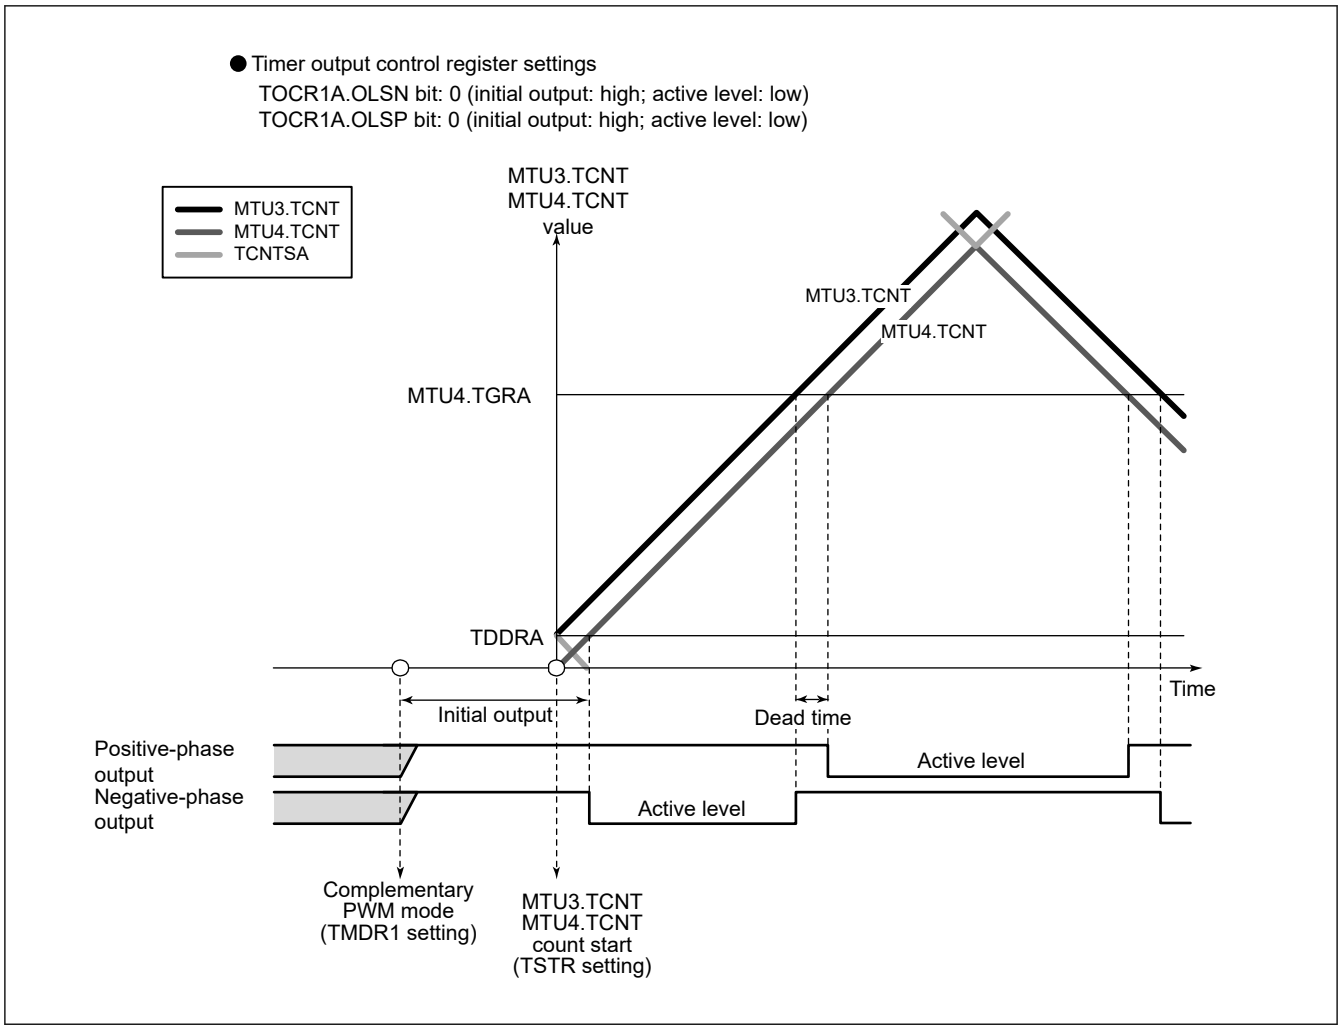

Figure 18.54 Example of initial output in complementary PWM mode (MTU3 and MTU4) (1)

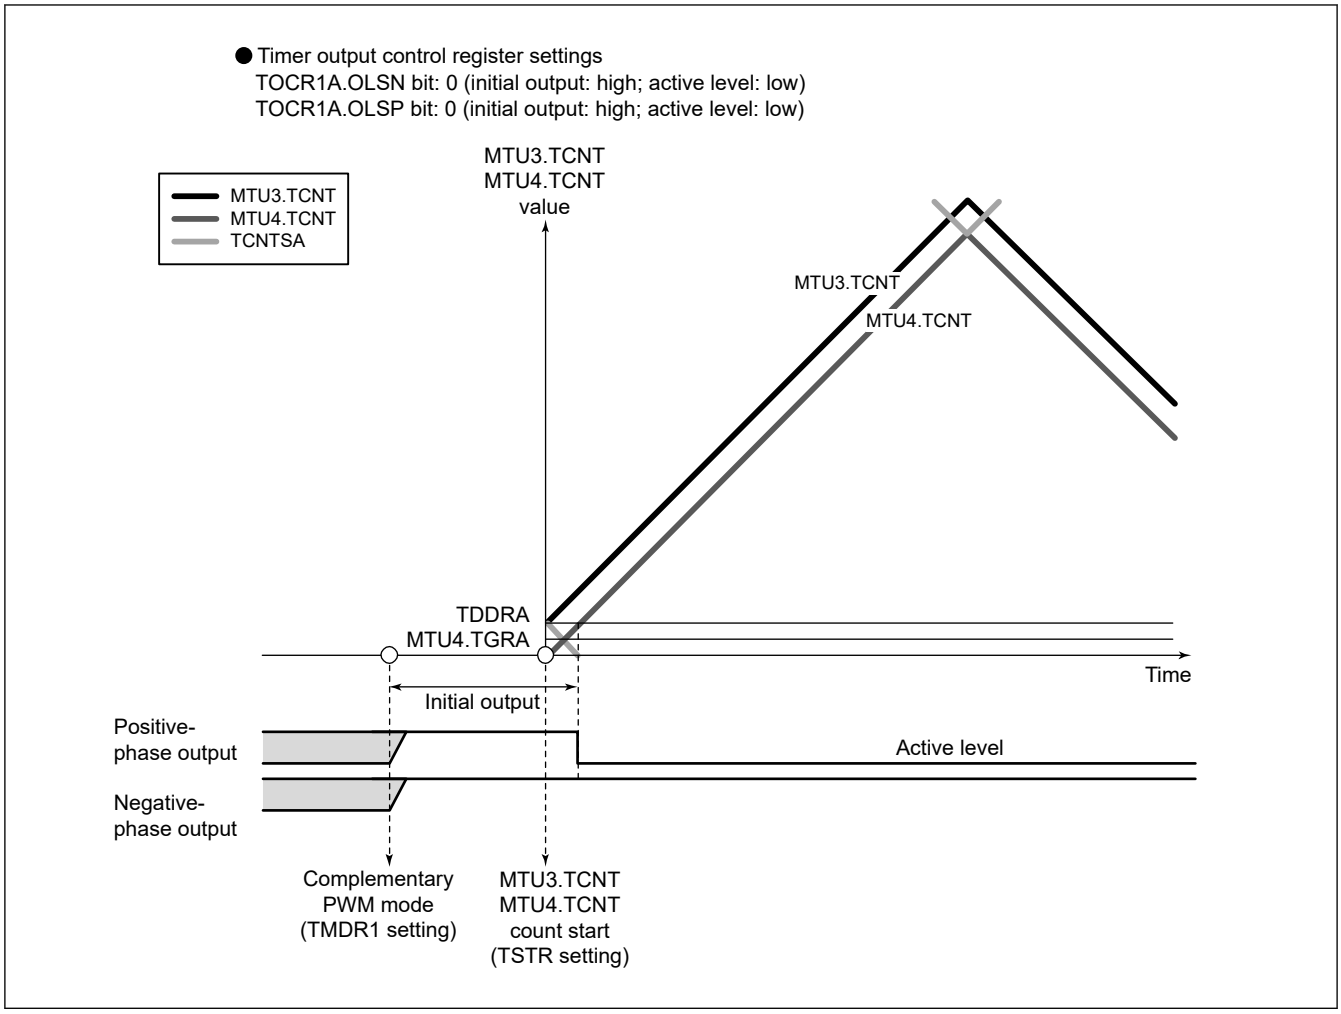

Figure 18.55 Example of initial output in complementary PWM mode (MTU3 and MTU4) (2)

(10) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six waveforms of three-phase PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the Timer Output Control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM pulses from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. Figure 18.56 to Figure 18.58 show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in Figure 18.56.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on.

As shown in Figure 18.57, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in Figure 18.58, compare match a' with new data in the temporary register occurs before compare-match c, but until compare-match c, which turns off the positive phase, other compare matches are ignored. As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

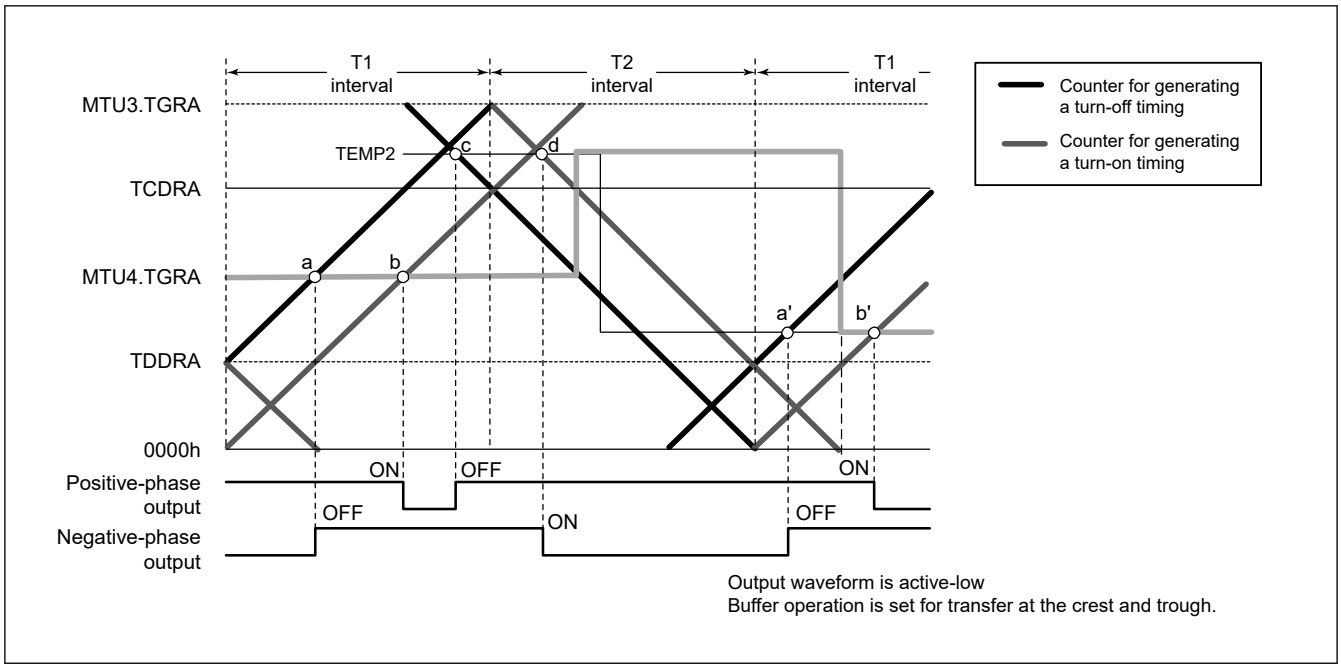

Figure 18.56 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (1)

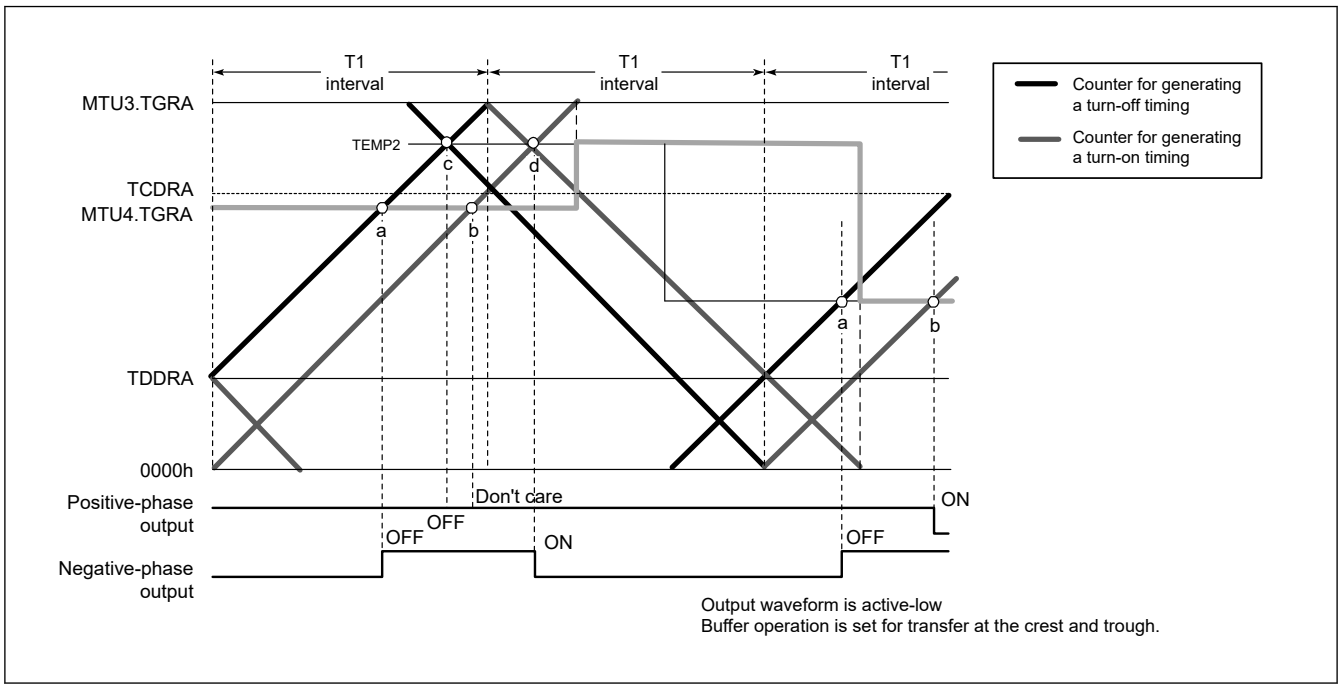

Figure 18.57 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (2)

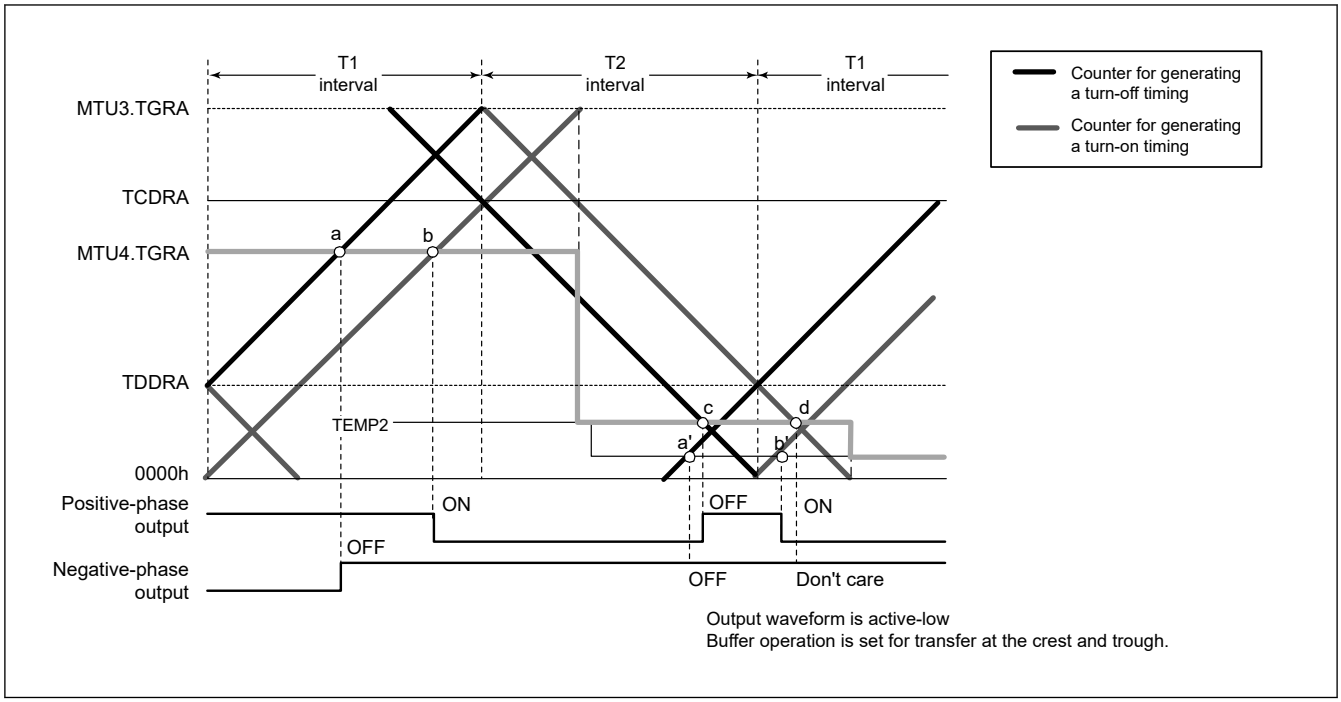

Figure 18.58 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (3)

(11) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM waveforms can be output as required. Figure 18.59 to Figure 18.63 show output examples.

A 100% duty waveform is output when the compare register value is set to 0x0000. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

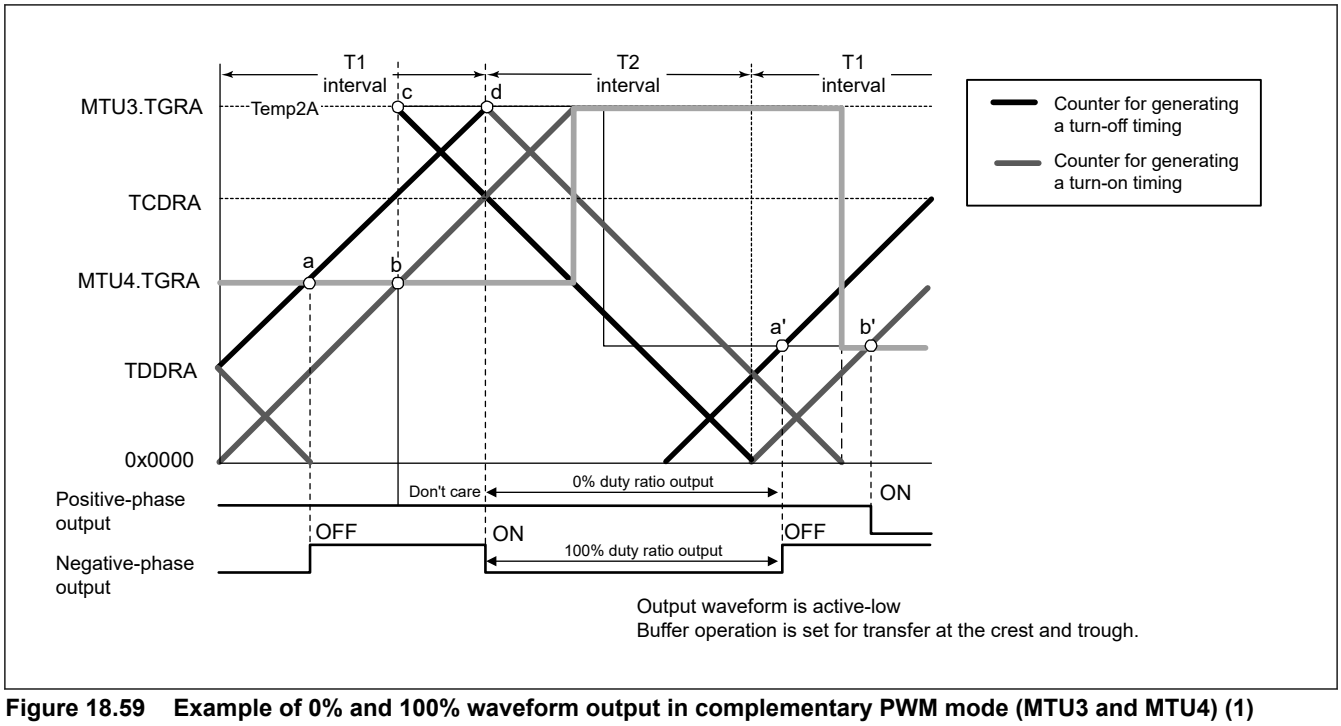

Figure 18.59 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (1)

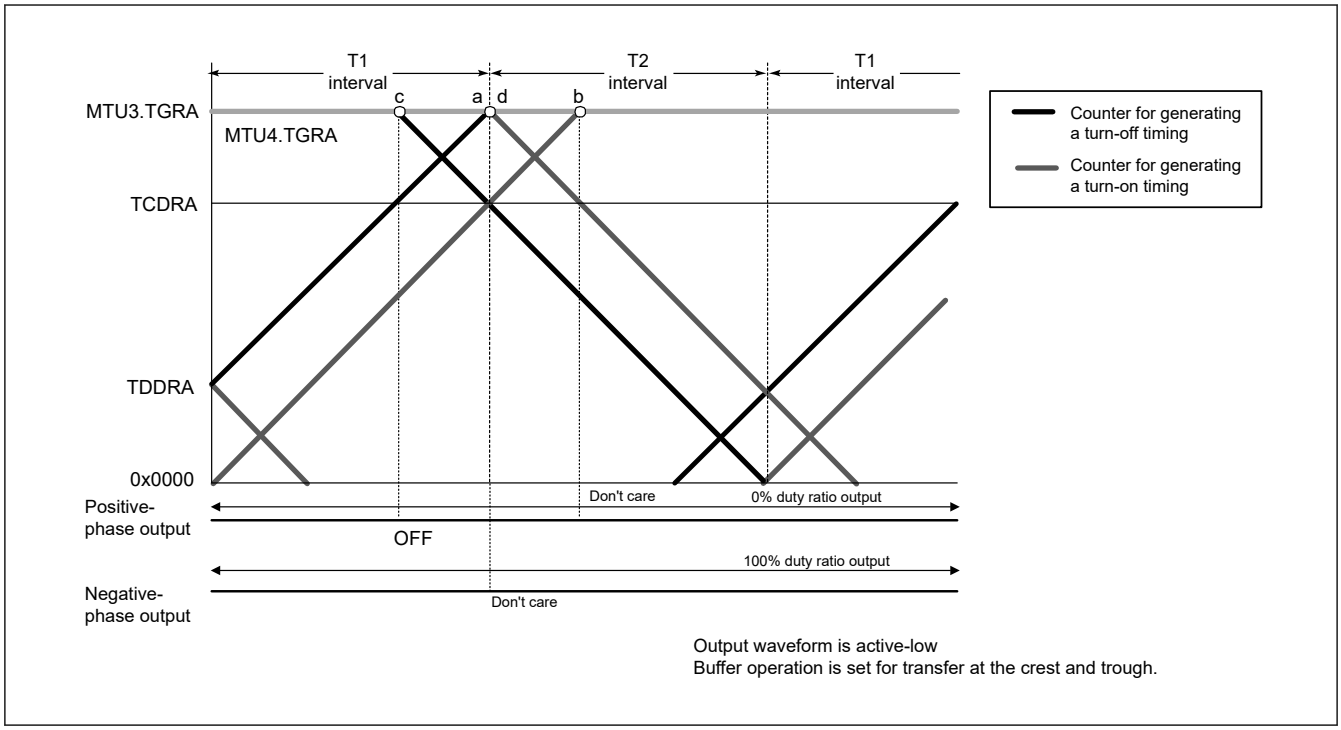

Figure 18.63 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (5)

(12) Toggle Output Synchronized with PWM Period

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM carrier period can be generated by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in Figure 18.64.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and 0x0000.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level.

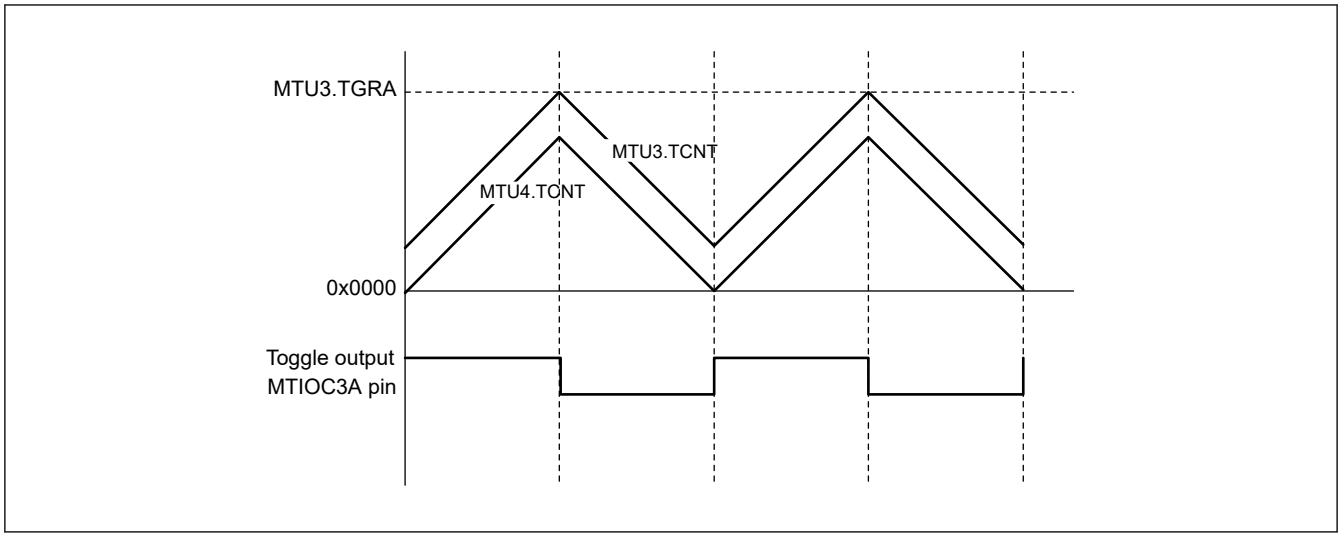

Figure 18.64 Example of toggle output waveform synchronized with PWM output (MTU3 and MTU4)

(13) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel when a mode for synchronization with another channel is specified through the timer synchronous register (TSYRA or TSYRB)) and synchronous clearing is selected with bits CCLR[2:0] in the timer control register (TCR).

Figure 18.65 shows an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

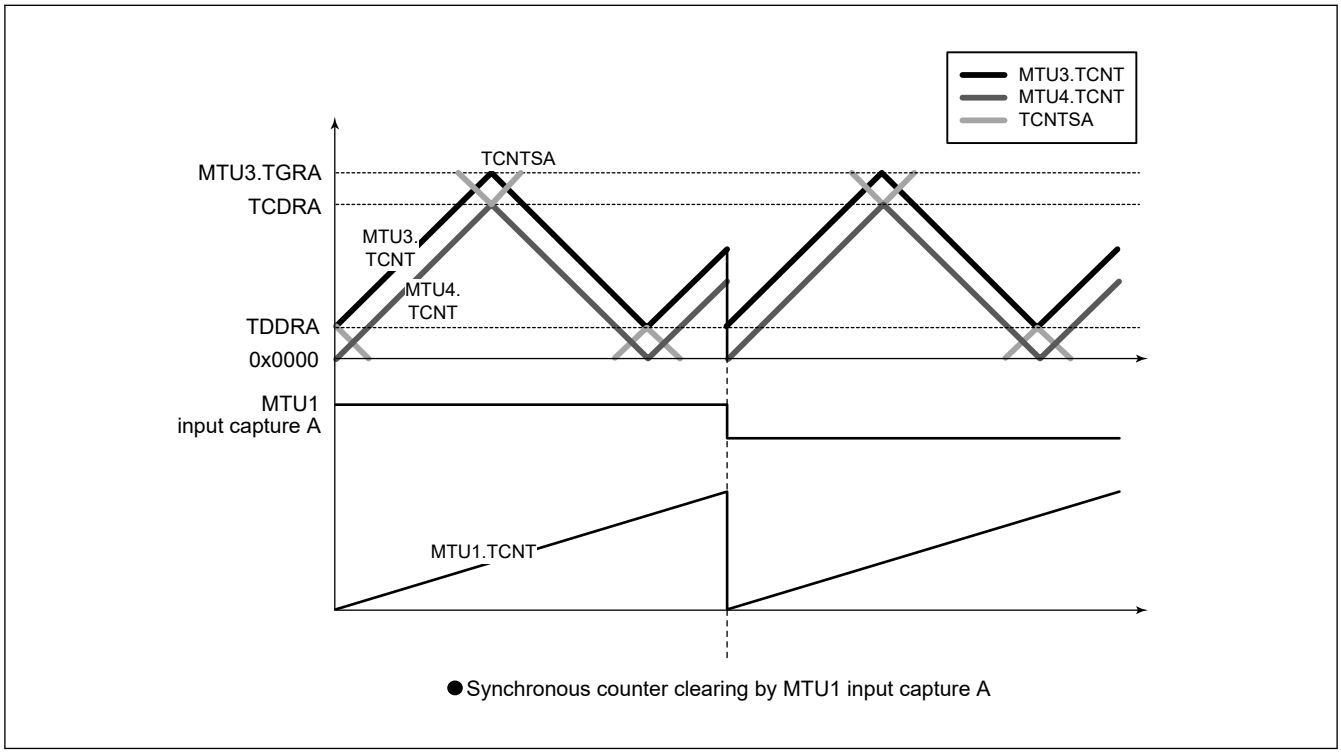

Figure 18.65 Counter clearing synchronized with another channel (MTU3 and MTU4)

(14) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb interval at the trough as indicated by (10) or (11) in Figure 18.66. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb interval at the trough, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 18.66) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU3 and MTU4, and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing generated in MTU0 to MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture in any of MTU0 to MTU2 can cause counter clearing.

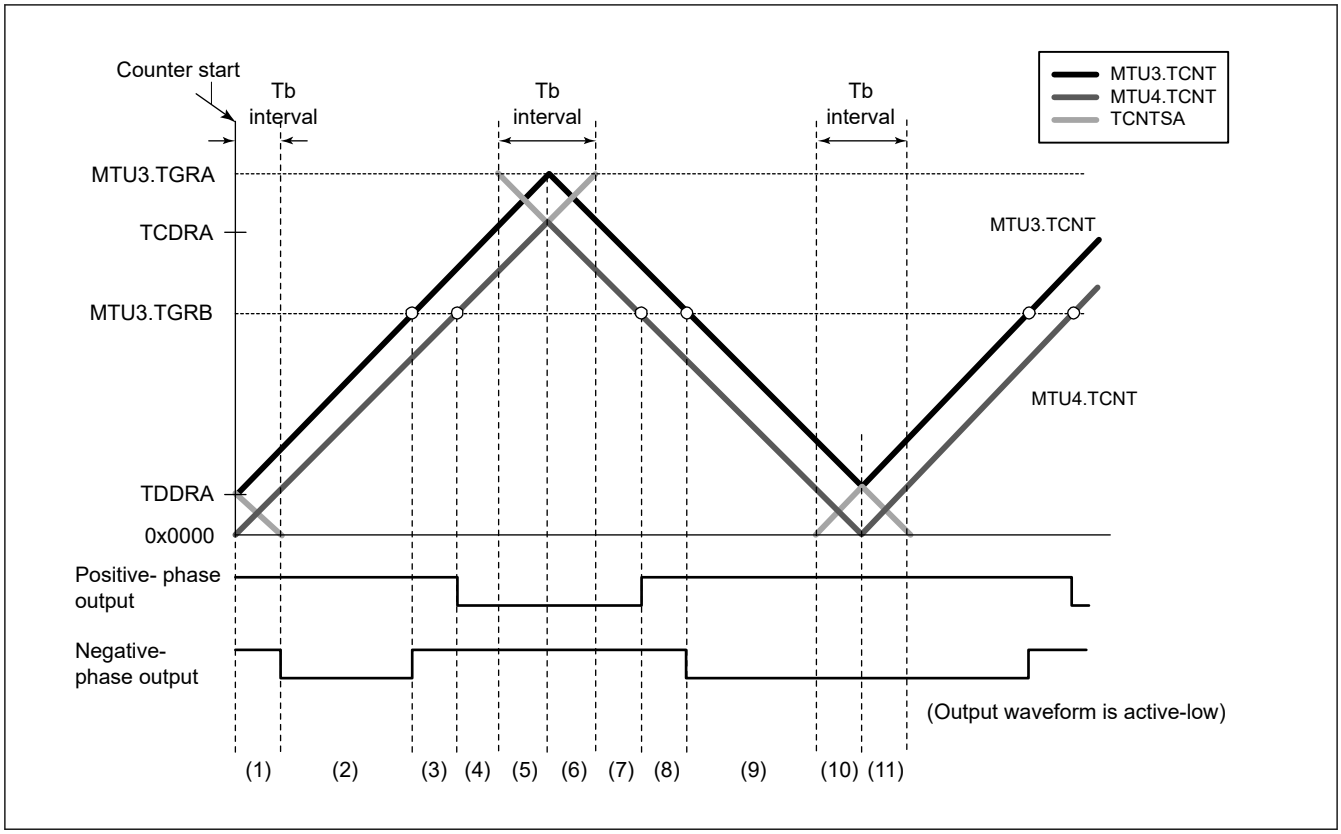

Figure 18.66 Timing for synchronous counter clearing (MTU3 and MTU4)

Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 18.67.

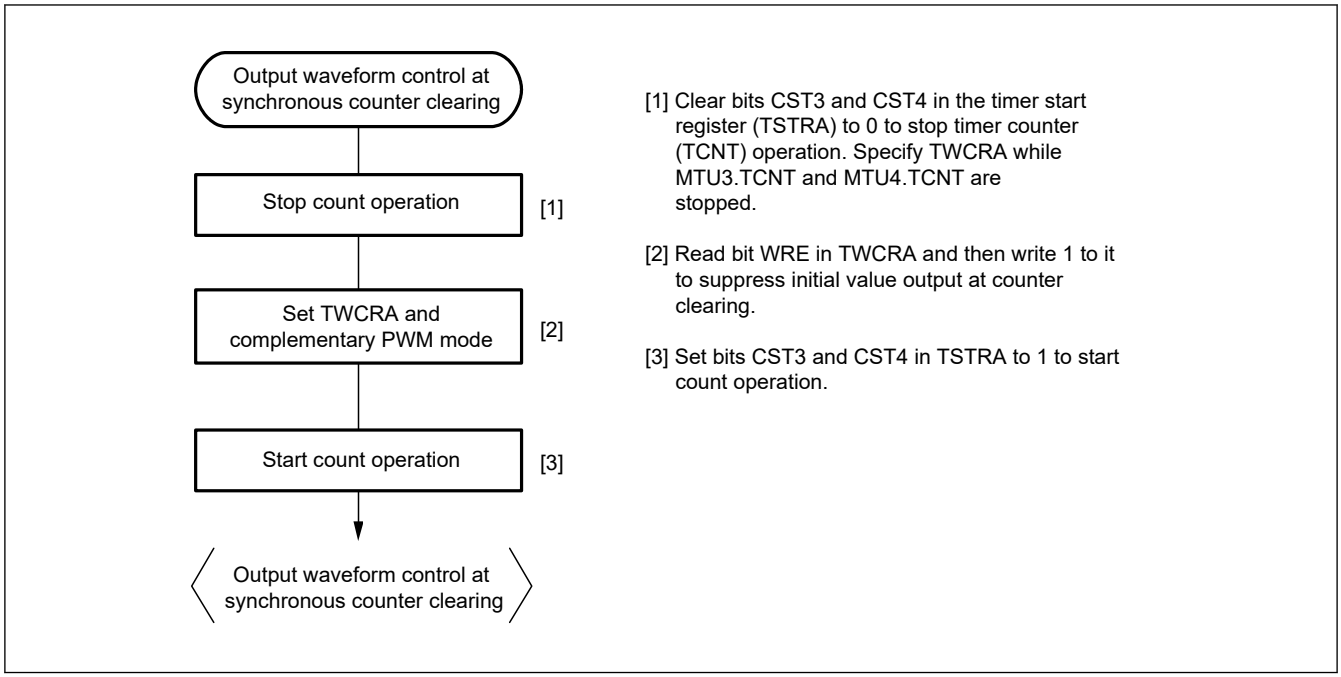

Figure 18.67 Example of procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode (MTU3 and MTU4)

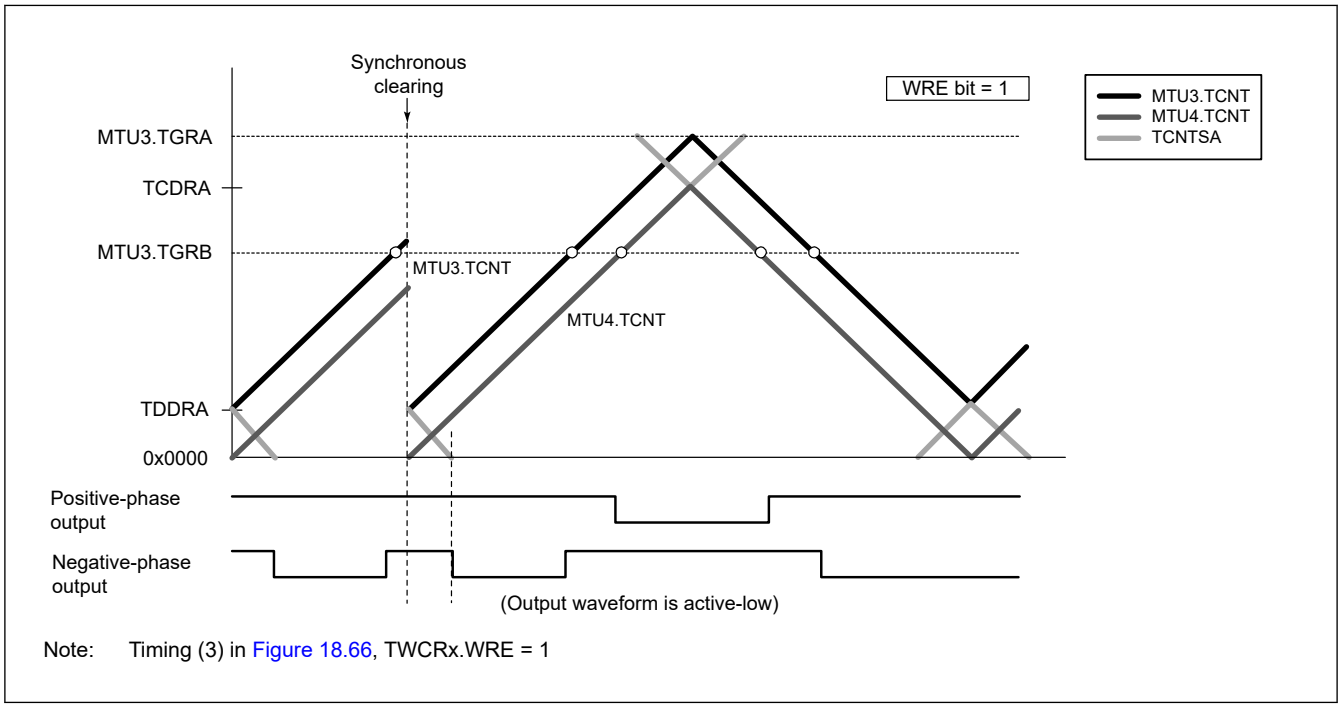
Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 18.68 to Figure 18.71 show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in Figure 18.68 to Figure 18.71, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 18.66, respectively.

In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is set to 0 and the WRE bit is set to 1 in TWCRB.



Note: Timing (3) in Figure 18.66, TWCRx.WRE = 1

Figure 18.71 Example of synchronous clearing in interval Tb at trough

(15) Suppressing Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing caused by MTU0 to MTU2 is suppressed only within the interval shown in Figure 18.72. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, see section 18.4.10.2. Synchronous Counter Clearing for MTU6 and MTU7.

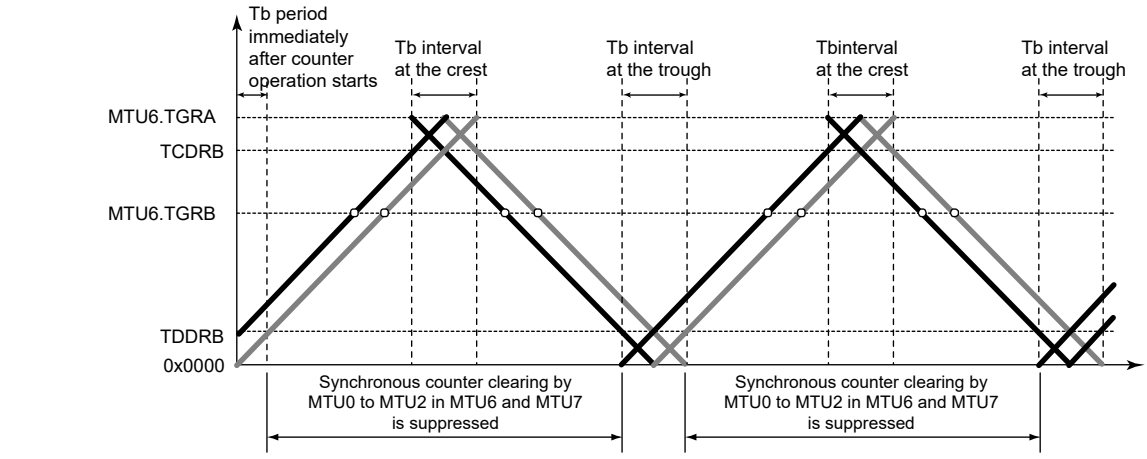

Figure 18.72 Synchronous clearing-suppressed interval specified by TWCRB.SCC bit by MTU0 to MTU2 in MTU6 and MTU7

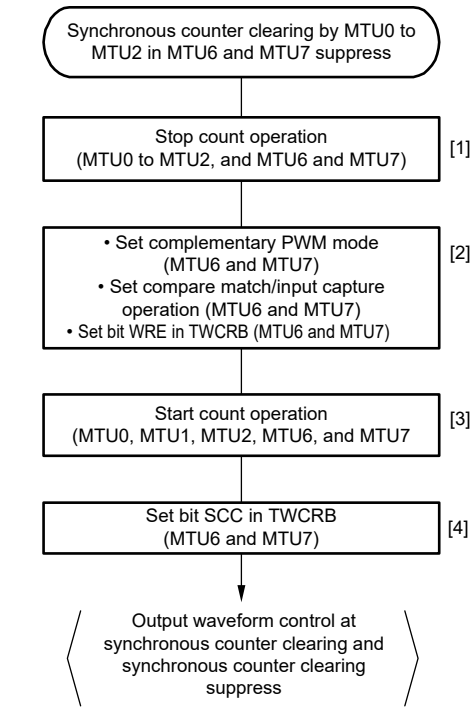
Example of Procedure for Suppressing Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is shown in Figure 18.73.



[1] Clear bits CST of the timer start register (TSTRB) in MTU6 and MTU7 to 0, and stop count operation. Clear bits CST of TSTRA in MTU0, MTU1, and MTU2 to 0, and stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0, MTU1, and MTU2.
When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation.
For synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7, set bits CST of TSTRA in MTU0, MTU1, and MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.

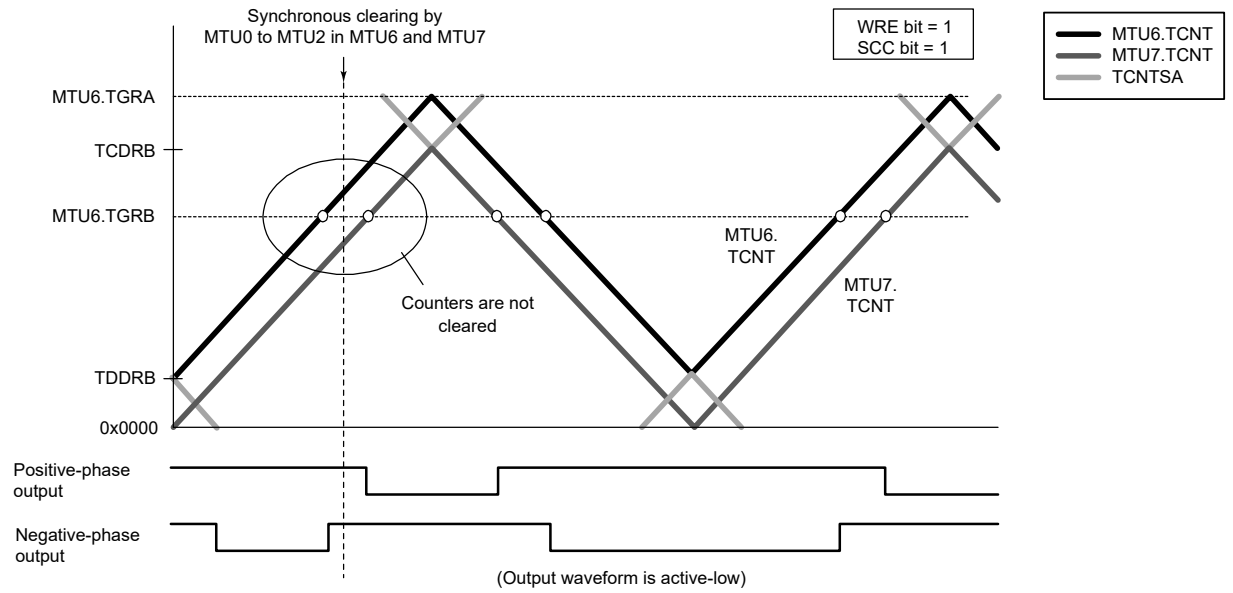
[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7*1.
Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

Note 1. The TWCRB.SCC bit value can be modified during counter operation.
However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed.
If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 18.73 Example of procedure for suppressing synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7

Examples of Suppression of Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

Figure 18.74 to Figure 18.77 show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in Figure 18.74 to Figure 18.77, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 18.66, respectively. In these examples, the WRE bit in TWCRB is set to 1.



Note: Timing (3) in Figure 18.66, TWCRB.WRE = 1 and TWCRB.SCC = 1 for MTU6 and MTU7

Note: Timing (11) in Figure 18.66, TWCRB.WRE = 1 and TWCRB.SCC = 1 for MTU6 and MTU7

Figure 18.77 Example of synchronous clearing in interval Tb at trough

(16) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit is set.

Figure 18.78 shows an operation example.

Note:
- Use this function only in complementary PWM mode 1 (transfer at crest).
- Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4, or SYNC6 and SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CE0A to CE0D, CE1A, and CE1B, or CE2A and CE2B bits in TSYCR).

- Do not set the PWM duty value to 0x0000.
- Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

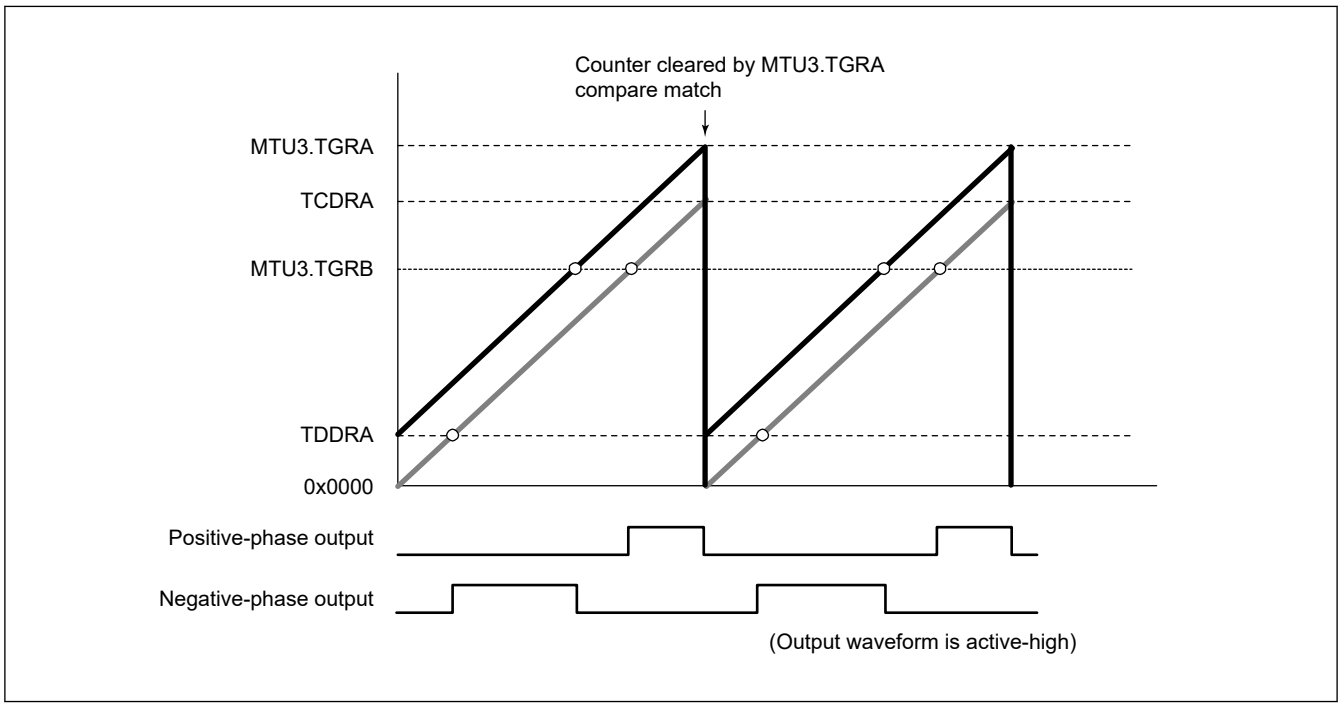

Figure 18.78 Example of counter clearing operation by MTU3.TGRA compare match

(17) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode, a brushless DC motor can easily be controlled using the TGCRA register. Figure 18.79 to Figure 18.82 show examples of brushless DC motor driving waveforms created using TGCRA.

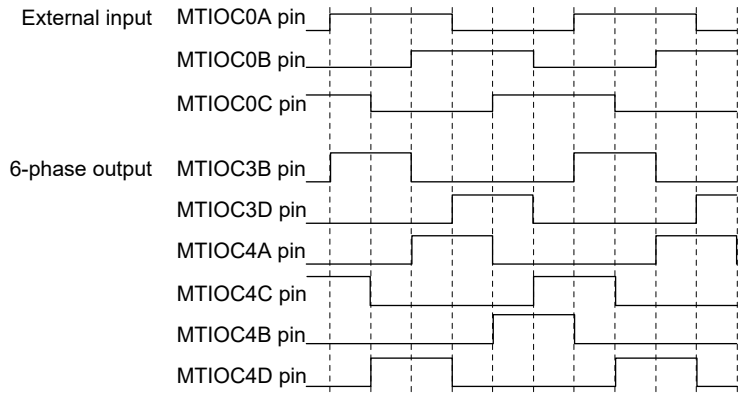
To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., set the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to timer input pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (specify appropriate settings with the I/O port registers of the I/O ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is set to 0 or 1.

The driving waveforms are output from the 6-phase output pins for complementary PWM mode.

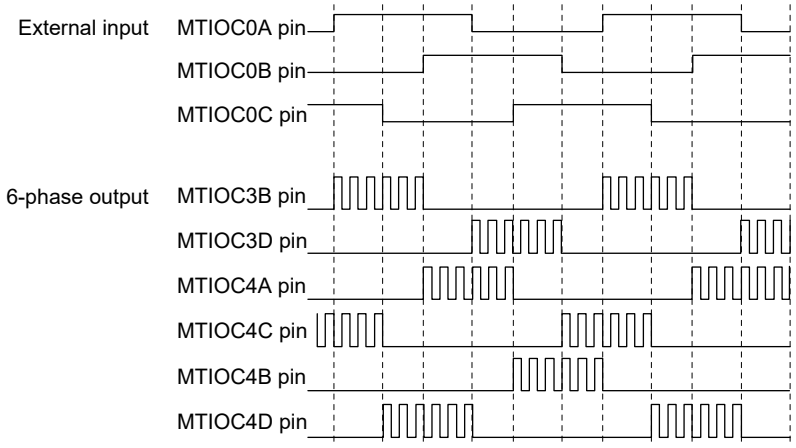
With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.



■ When TGCRA.BDC = 1, TGCRA.N = 0, TGCRA.P = 0, TGCRA.FB = 0, and output active level = high

Figure 18.79 Example of output phase switching by external input (1)



■ When TGCRA.BDC = 1, TGCRA.N = 1, TGCRA.P = 1, TGCRA.FB = 0, and output active level = high

Figure 18.80 Example of output phase switching by external input (2)

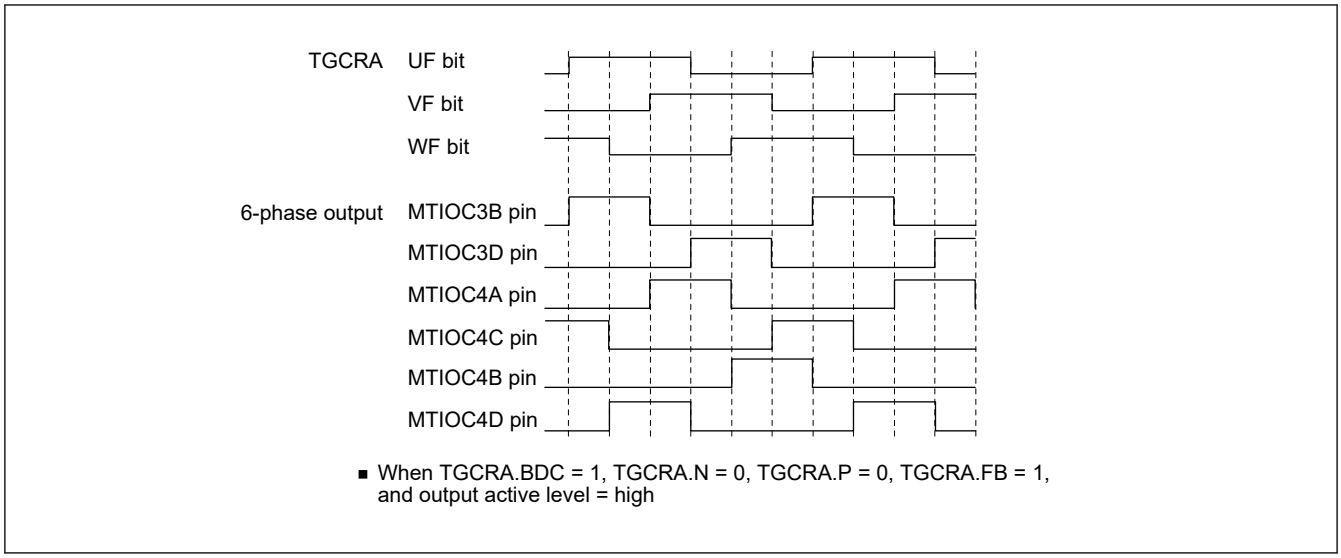


Figure 18.81 Example of output phase switching through UF, VF, and WF bit settings (1)

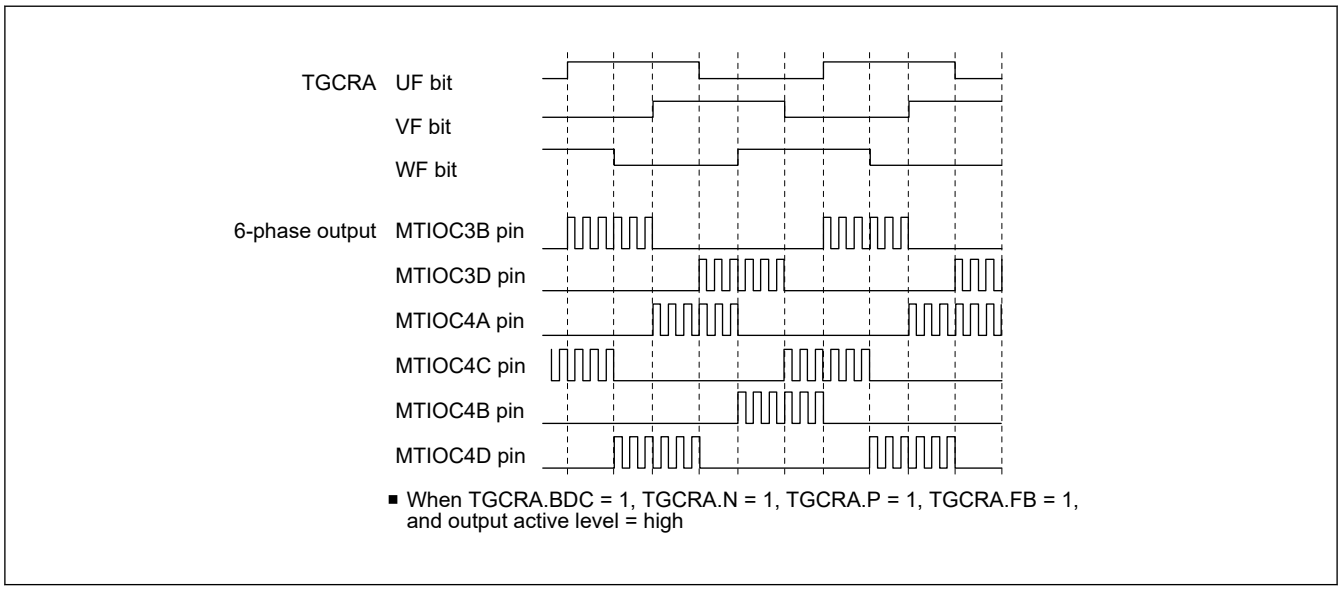

Figure 18.82 Example of output phase switching through UF, VF, and WF bit settings (2)

(18) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D converter start requests can be specified by setting the TIER.TTGE bit to 1. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

(19) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD), set also buffer registers B (MTU3.TGRE, MTU4.TGRE, MTU4.TGRF, MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register

A value − 1). For details of the setting procedure, see section 18.4.8.1. Example of Complementary PWM Mode Setting Procedure.

Note: When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value − 1), asymmetric PWM waveforms are output.

Figure 18.83 shows an example of double buffer operation.

Each register data is transferred as follows.

- After MTU4.TGRD or MTU7.TGRD (buffer A) is written to, data is transferred from MTU4.TGRD or MTU7.TGRD (buffer A) to Temp3A or Temp6A (temporary A) and from MTU4.TGRF or MTU7.TGRF (buffer B) to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to MTU4.TGRB or MTU7.TGRB (compare).
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to MTU4.TGRB or MTU7.TGRB (compare).

In the crest interval (Tb interval at crest), the compare register and temporary register A are valid; in the trough interval (Tb interval at trough), the compare register and temporary register B are valid.

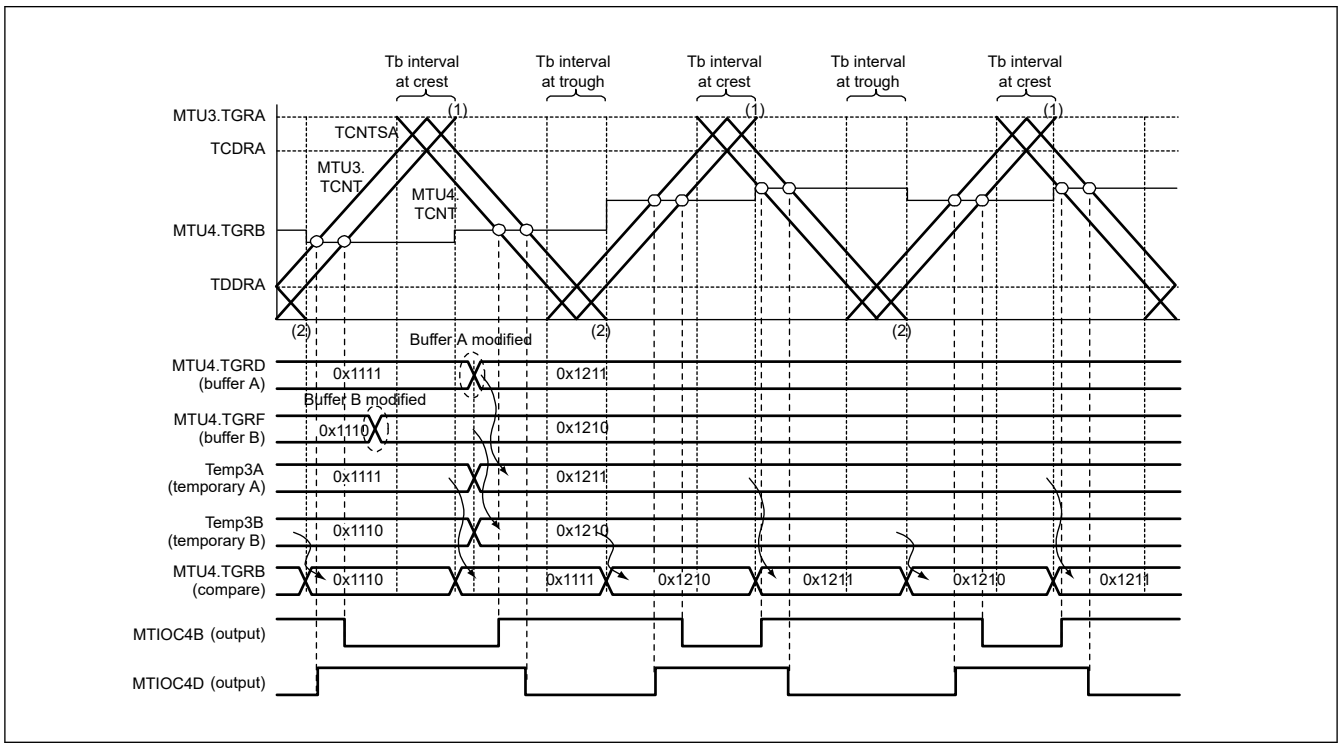

Figure 18.83 Example of double buffer operation

Figure 18.84 shows an example when the buffer write value is smaller than the TDDRA value, and Figure 18.85 shows an example when the write value is greater than TCDRA.

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

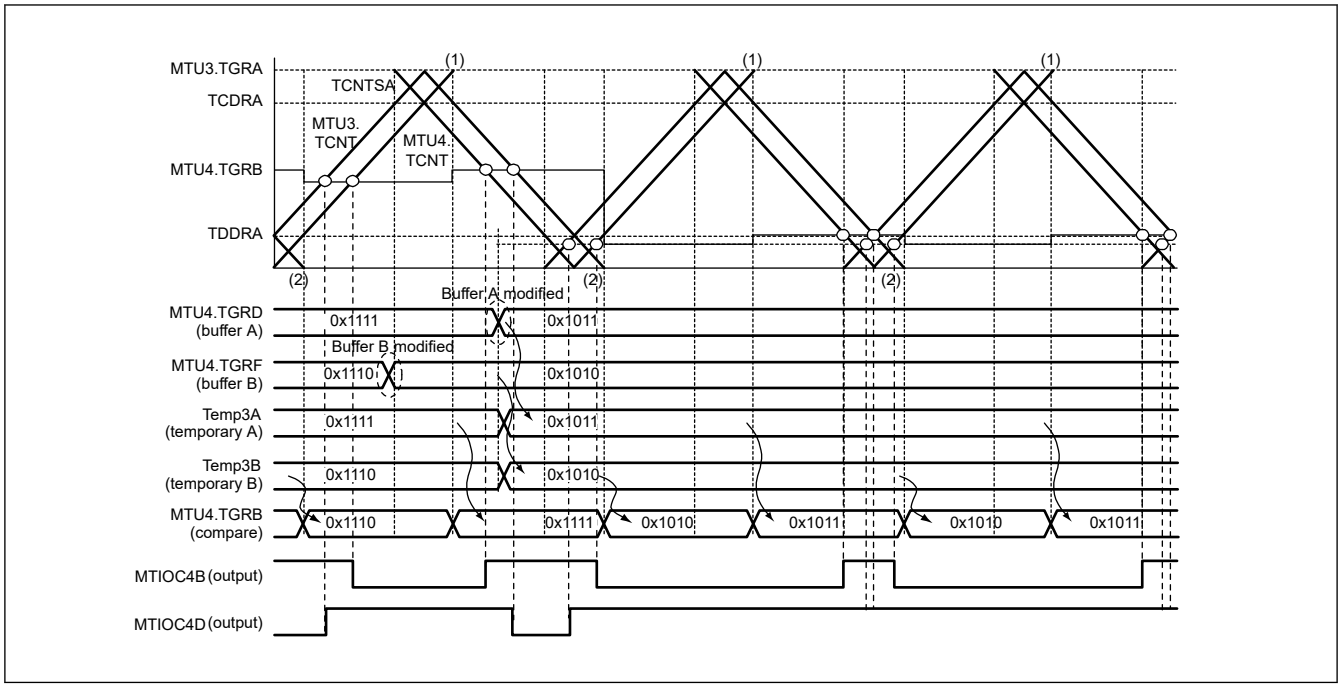

Figure 18.84 Example of double buffer operation (buffer write value is smaller than TDDRA)

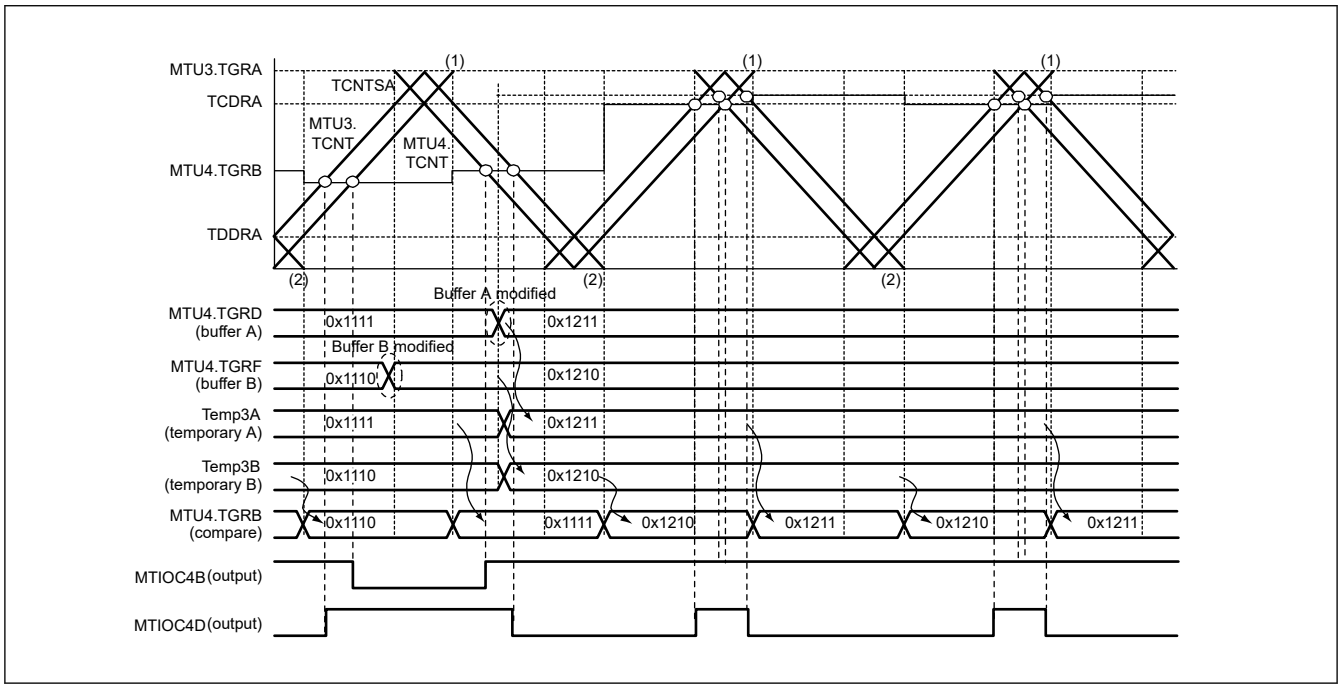

Figure 18.85 Example of double buffer operation (buffer write value is greater than TCDRA)

18.4.8.3 Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.

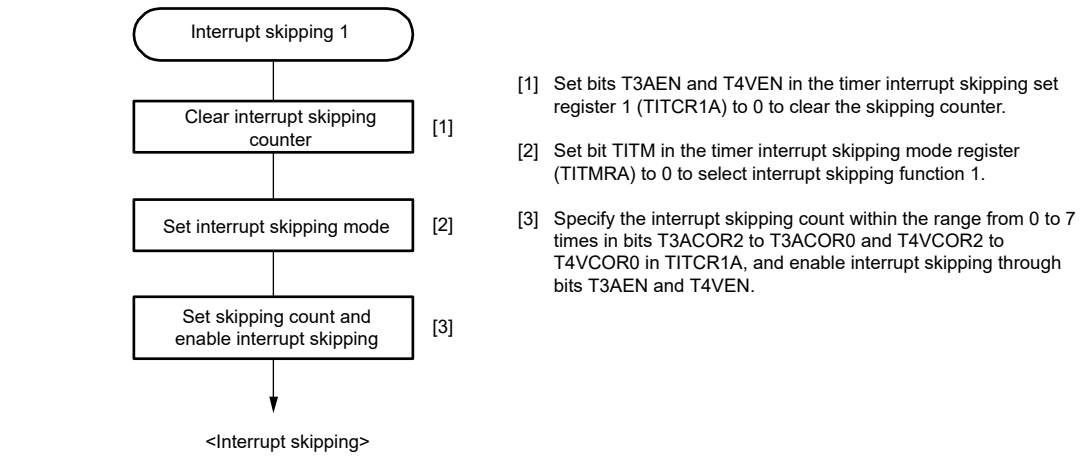
Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, see description (3) Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, see section 18.4.9. A/D Converter Start Request Delaying Function.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to set the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(1) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 18.86 shows an example of the interrupt skipping function 1 setting procedure. Figure 18.87 shows the periods during which interrupt skipping count can be changed.



Note: The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to set the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 18.86 Example of interrupt skipping function 1 setting procedure

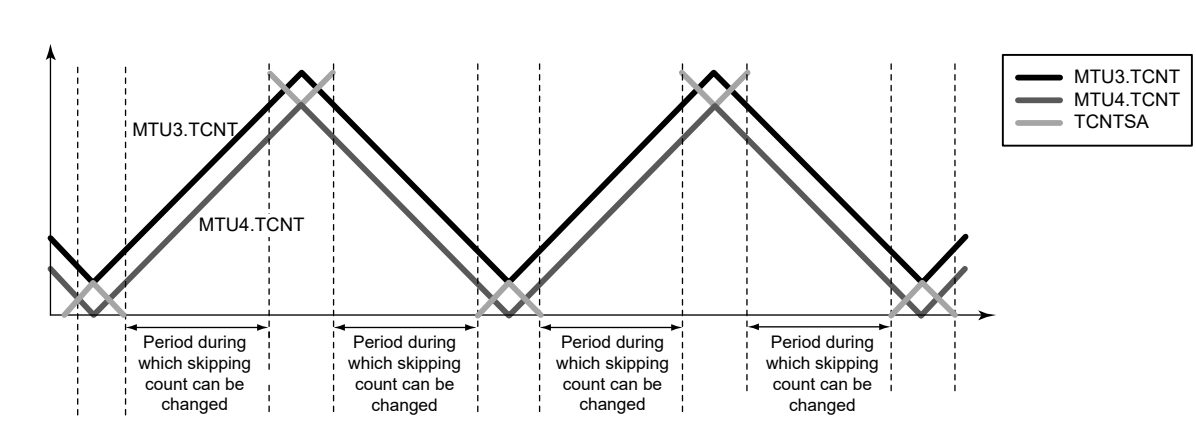


Figure 18.87 Periods during which interrupt skipping count can be changed

(2) Example of Interrupt Skipping Function 1

Figure 18.88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

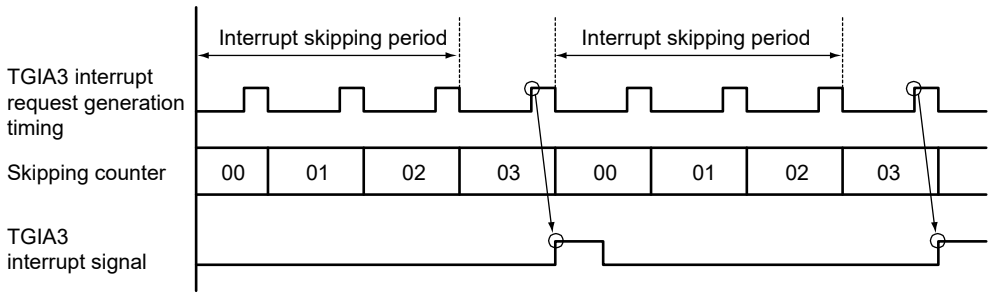

Figure 18.88 Example of interrupt skipping function 1

(3) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

Figure 18.89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 18.90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b).

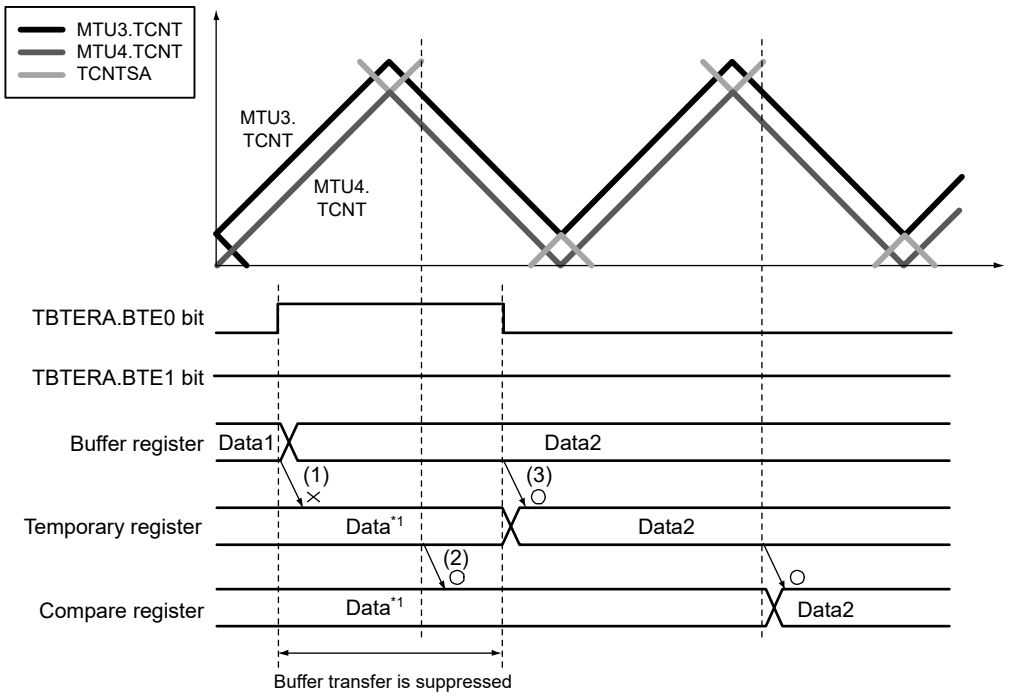
While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.

Note that the buffer transfer-enabled period depends on the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in the TITCR1A (TITCR1B) register. Figure 18.91 shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

Note: This function must be used in combination with interrupt skipping function 1.

When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that buffer transfer is not linked with interrupt skipping (set the BTE1 bit in TBTERA or TBTERB to 0).

If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.

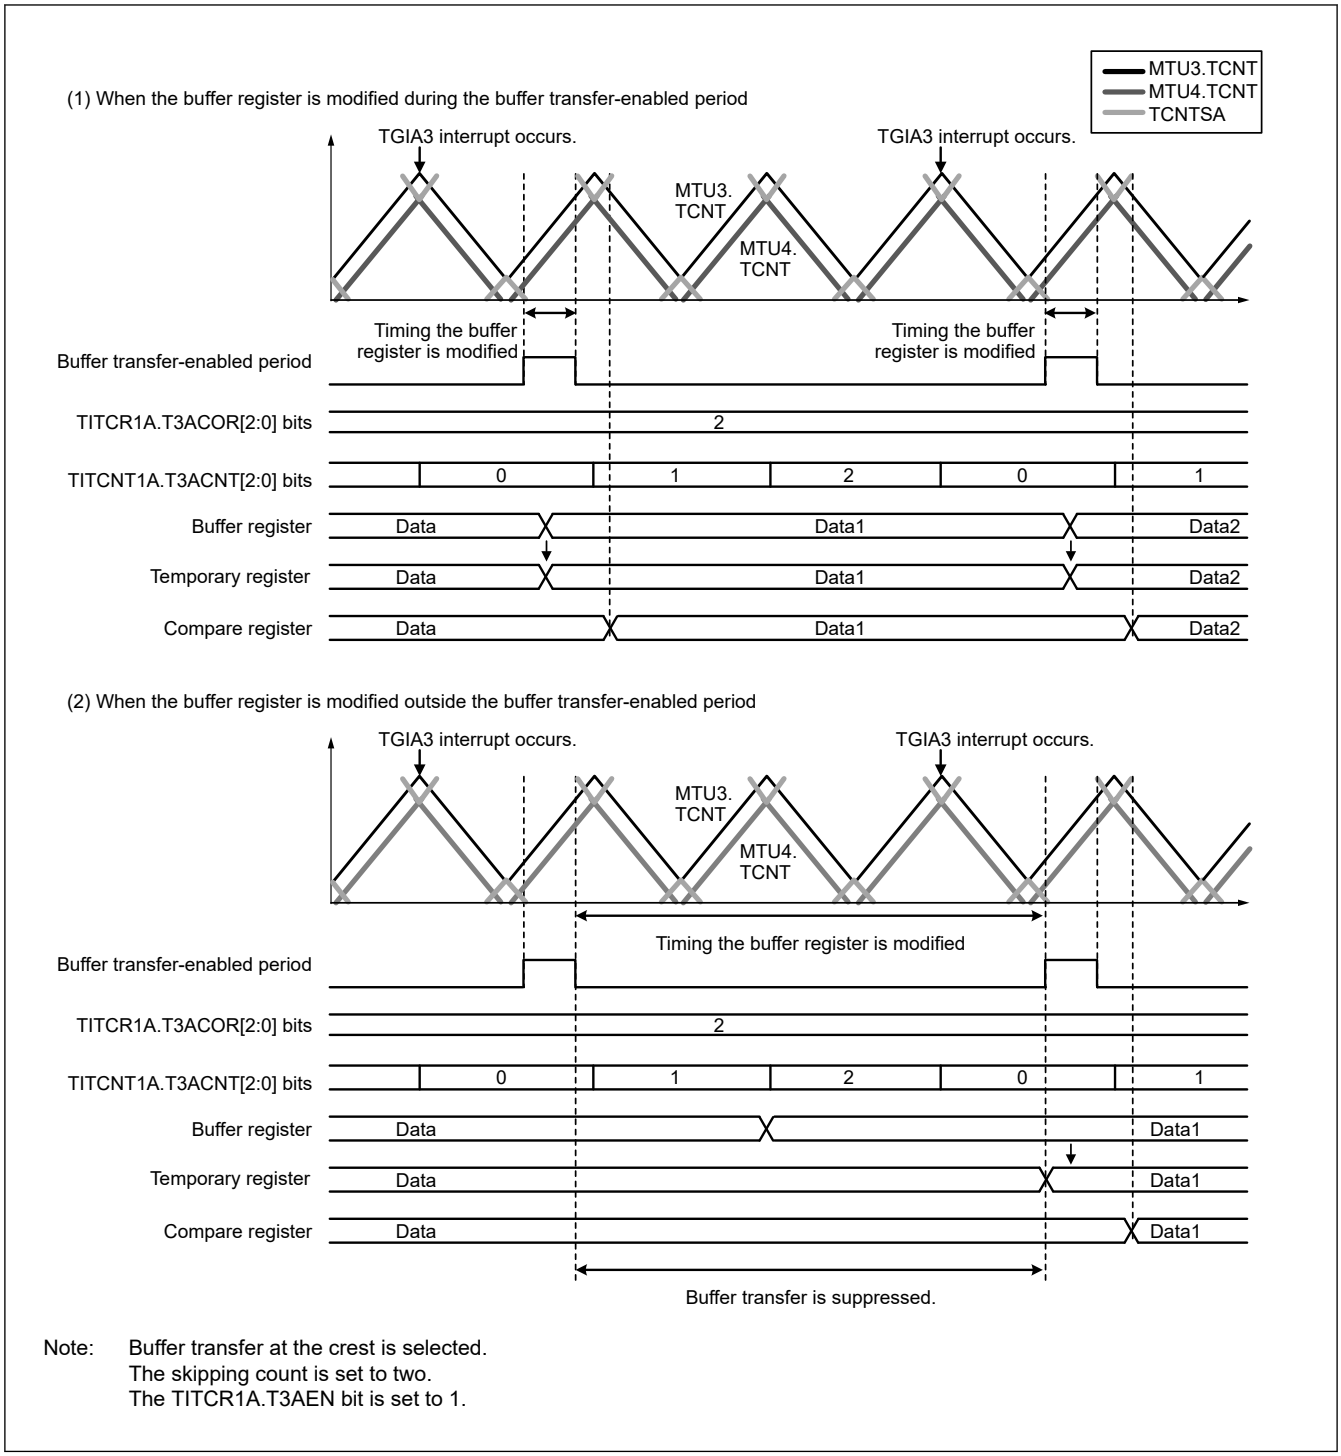


[Legend]

(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).
(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.
(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

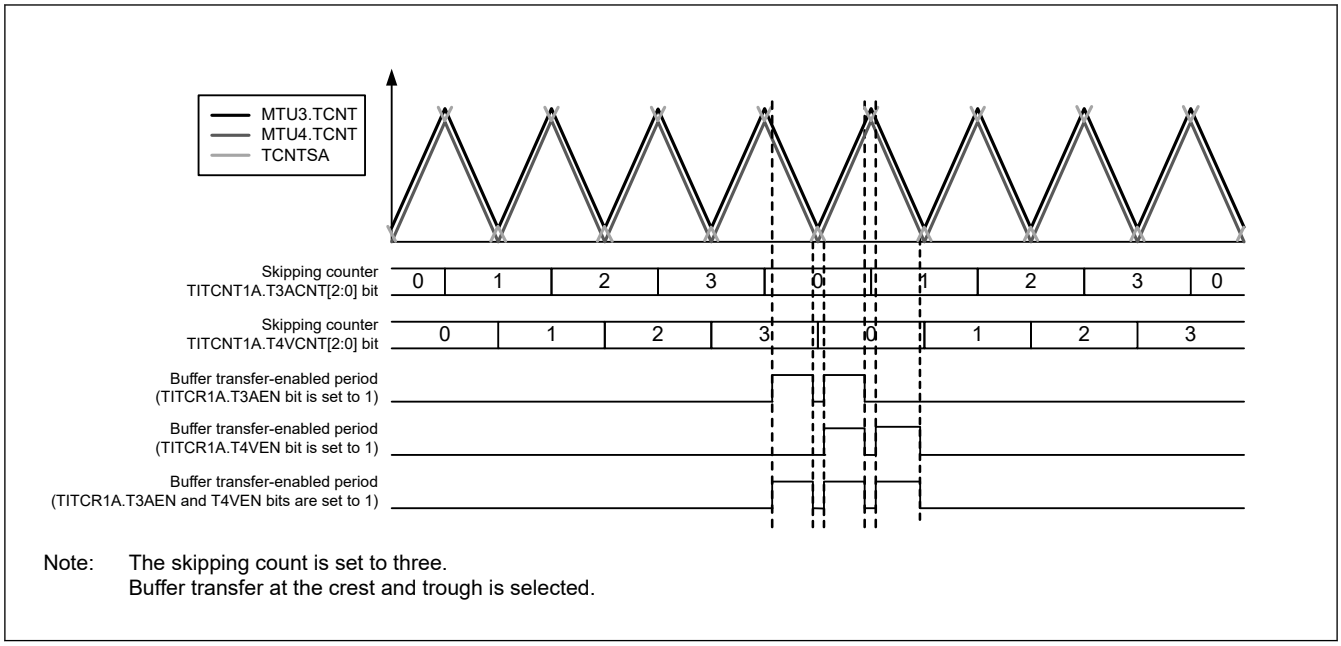
Note 1. When buffer transfer at the crest is selected.

Figure 18.89 Example of operation when buffer transfer is disabled (BTE[1:0] = 01b)



Note: Buffer transfer at the crest is selected.
The skipping count is set to two.
The TITCR1A.T3AEN bit is set to 1.

Figure 18.90 Example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b)



Note: The skipping count is set to three.
Buffer transfer at the crest and trough is selected.

Figure 18.91 Relationship between bits T3AEN and T4VEN in TITCR1A and buffer transfer-enabled period

18.4.8.4 Complementary PWM Mode Output Protection Functions

The MTU provides the following protection functions for complementary PWM mode output.

(1) Register and Counter Miswrite Prevention Function

With the exception of the buffer registers, which can be modified, access by the CPU can be enabled or disabled for the mode registers, control registers, compare registers, and counters used in complementary PWM mode by means of the RWE bit in the timer read/write enable register (TRWERA or TRWERB). The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

47 registers in total

MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOEERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB

This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(2) Halting of PWM Output by External Signal

The 6-phase PWM output pins can be set to the high-impedance state automatically by inputting specified external signals.

For details, see section 19, Port Output Enable 3 (POE3).

18.4.9 A/D Converter Start Request Delaying Function

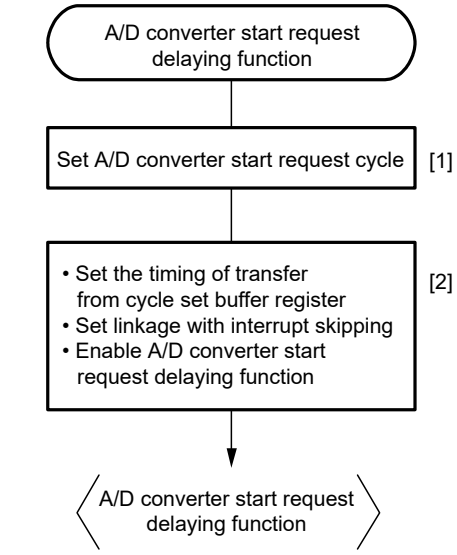
A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR).

18.4.9.1 Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 18.92 shows an example of procedure for specifying the A/D converter start request delaying function.



[1] Set the cycle in the timer A/D converter start request cycle set buffer register (MTU4.TADCOBRA or MTU4.TADCOBRB) and timer A/D converter start request cycle register (MTU4.TADCORA or MTU4.TADCORB).
(When the timing of transfer from the cycle buffer register to cycle set register is set to the trough, or both trough and crest in step [2] below, the same initial value must be specified in the cycle buffer register and cycle register because transfer is performed immediately after counting starts.)

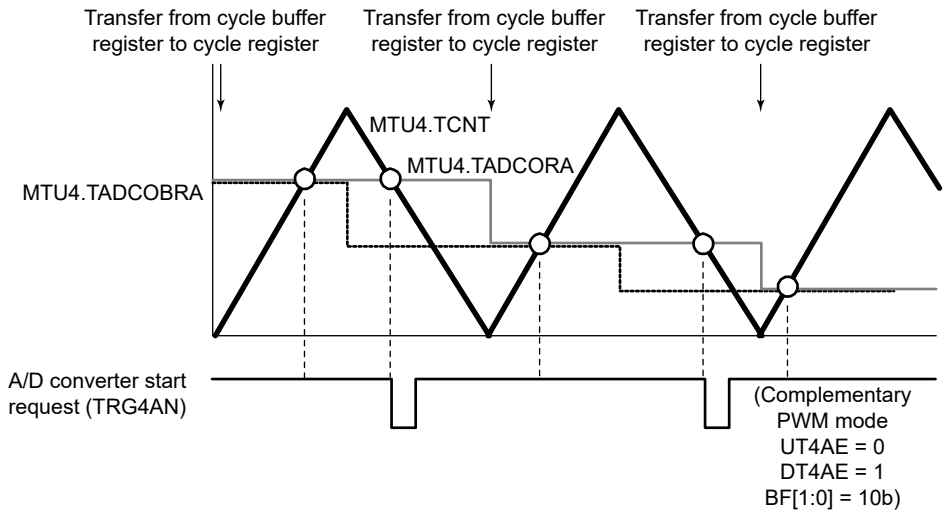
[2] Use the BF[1:0] bits in the timer A/D converter start request control register (MTU4.TADCR) to specify the timing of transfer from the timer A/D converter start request cycle set buffer register to A/D converter start request cycle set register.
- Specify whether to link with interrupt skipping through bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE.
- Use bits UT4AE, DT4AE, UT4BE, and DT4BE to enable A/D converter start requests (TRG4AN or TRG4BN).

Note: Perform MTU4.TADCR setting while MTU4.TCNT is stopped.
Note: Set MTU4.TADCR.BF[1] to 0 when complementary PWM mode is not selected.
Note: Set ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, and DT4BE to 0 when complementary PWM mode is not selected.

Figure 18.92 Example of procedure for specifying A/D converter start request delaying function (MTU3 and MTU4)

18.4.9.2 Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 18.93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.



Note: Period in which A/D converter start requests are enabled (UT4AE = 1): 0 ≤ MTU4.TCNT ≤ TCDR − 1
Period in which A/D converter start requests are enabled (DT4AE = 1): TCDR ≥ MTU4.TCNT ≥ 1
UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Figure 18.93 Basic example of A/D converter start request signal (TRG4AN) operation

18.4.9.3 Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

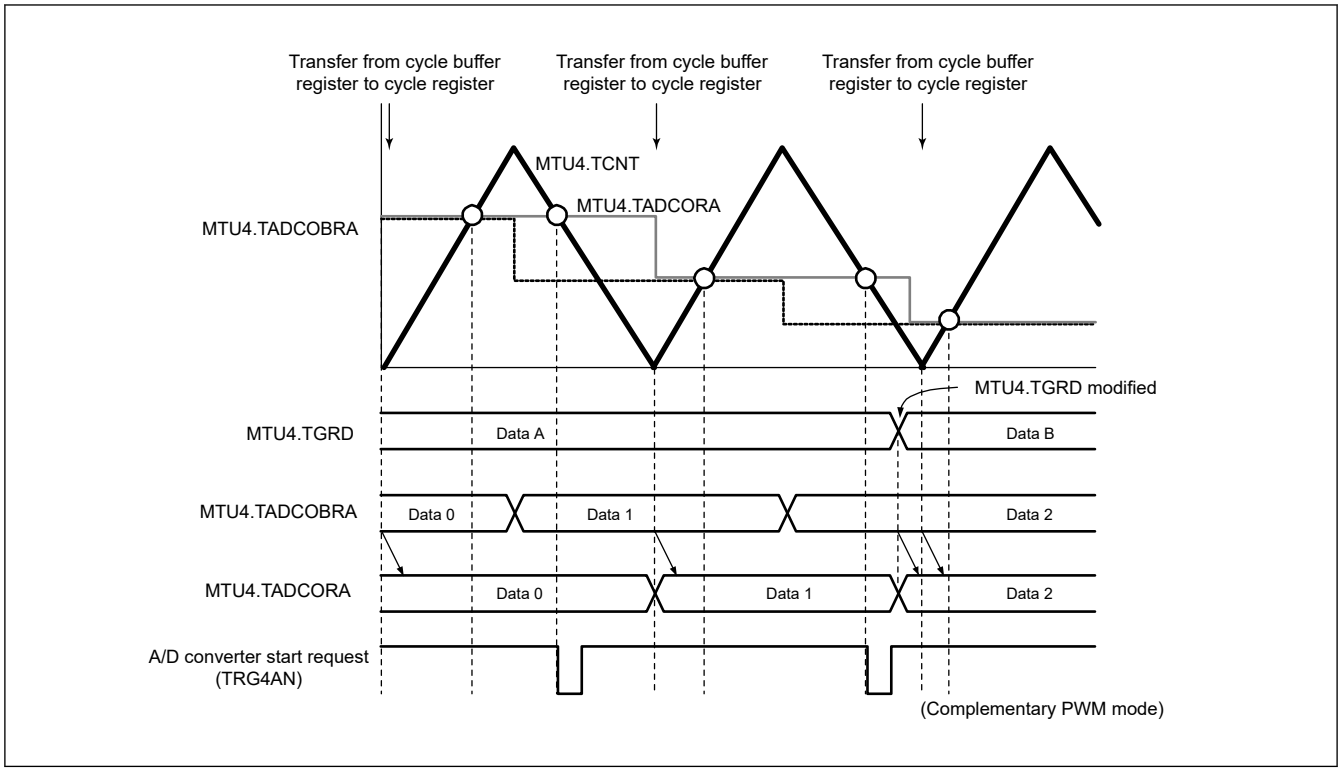


Figure 18.94 Example of A/D converter start request signal (TRG4AN) and buffer transfer operation

18.4.9.4 A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the MTU4.TADCR (MTU7.TADCR) register.

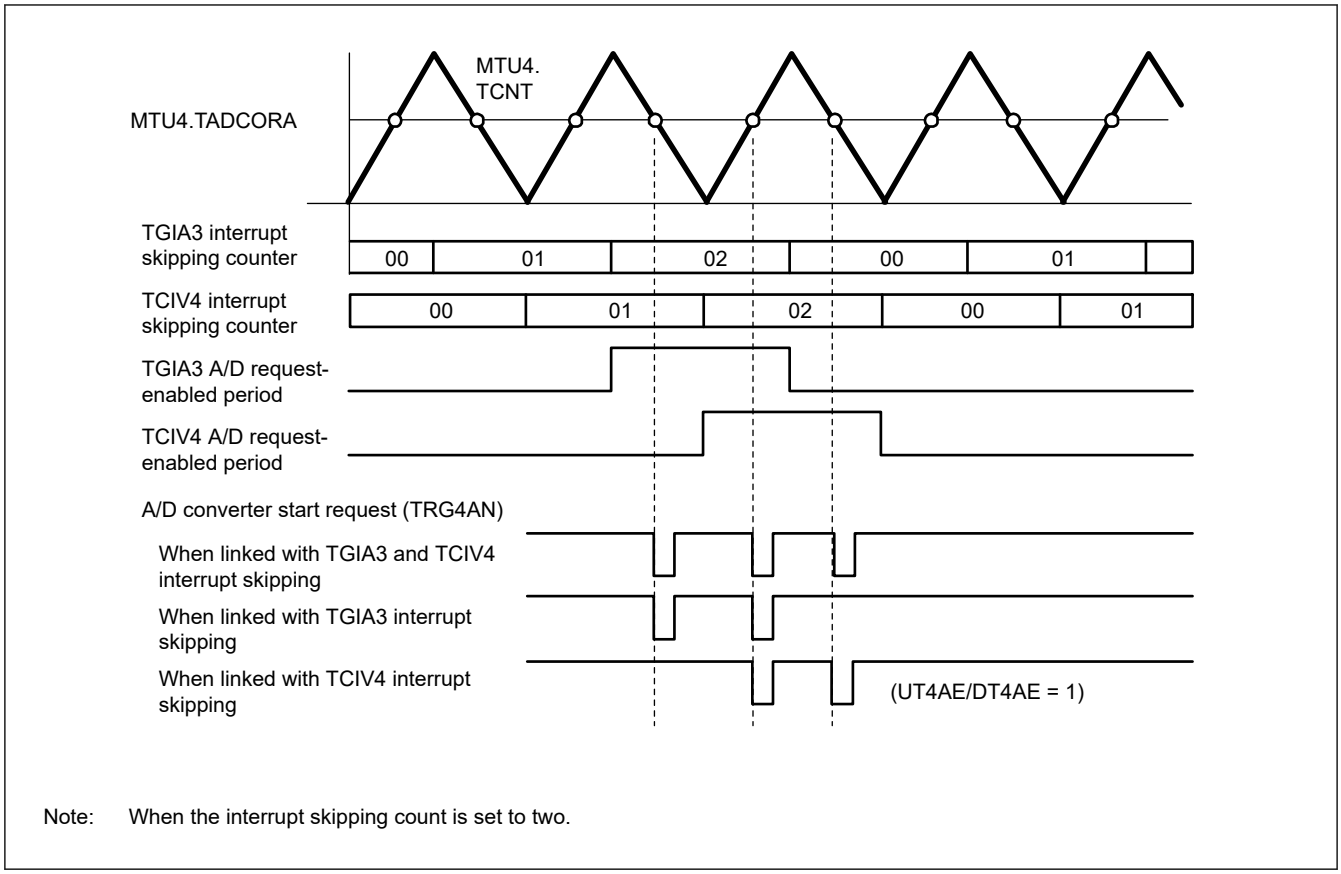
Figure 18.95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

Figure 18.96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

Note: This function should be used in combination with interrupt skipping 1.

When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (set the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).

When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging 0x0002 to the value set in TCDRA minus 2 (value set in TCDRB minus 2).



Note: When the interrupt skipping count is set to two.

Figure 18.95 Example of A/D converter start request signal (TRG4AN) operation linked with interrupt skipping function 1 (UT4AE and DT4AE = 1)

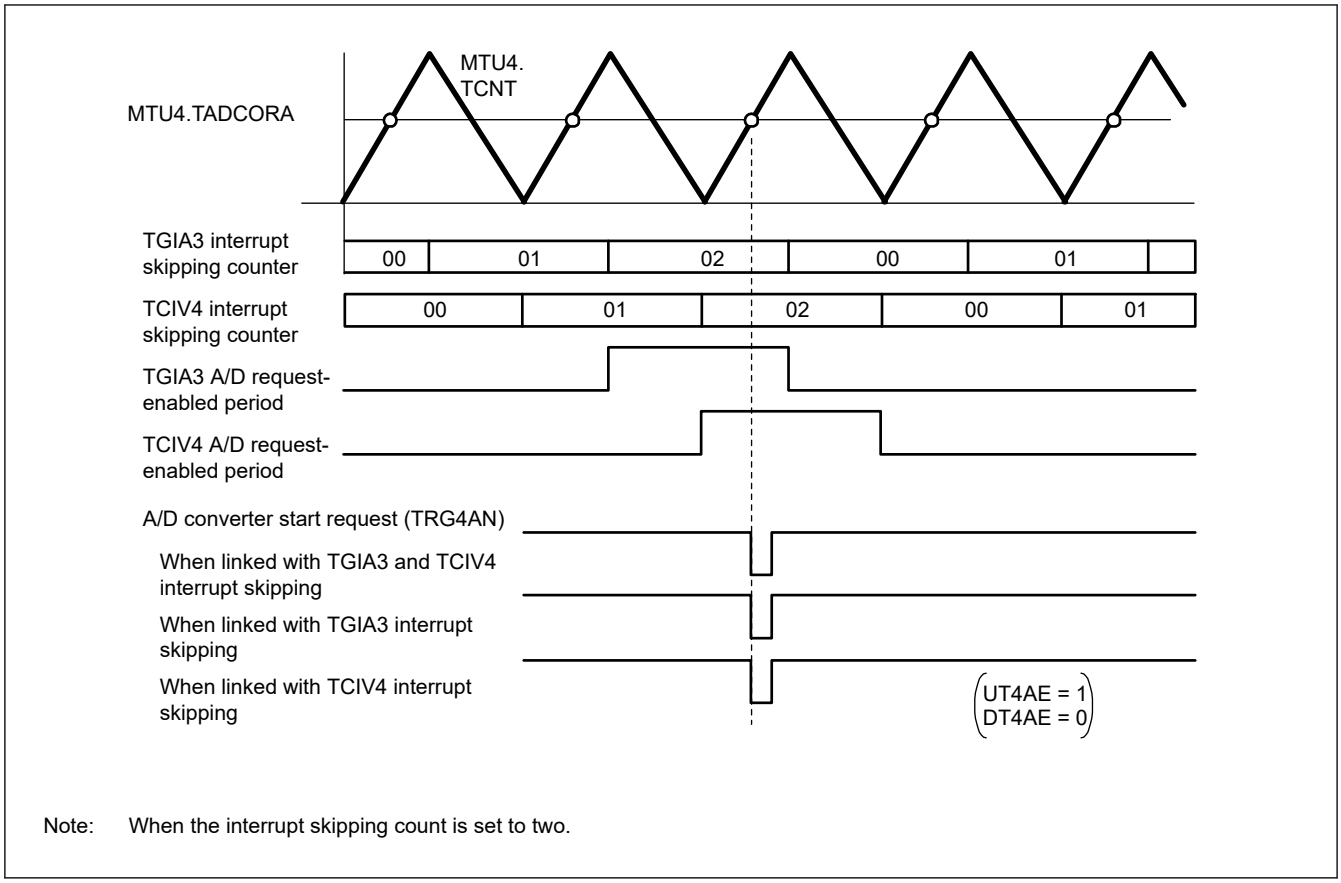


Figure 18.96 Example of A/D converter start request signal (TRG4AN) operation linked with interrupt skipping function 1 (UT4AE = 1, DT4AE = 0)

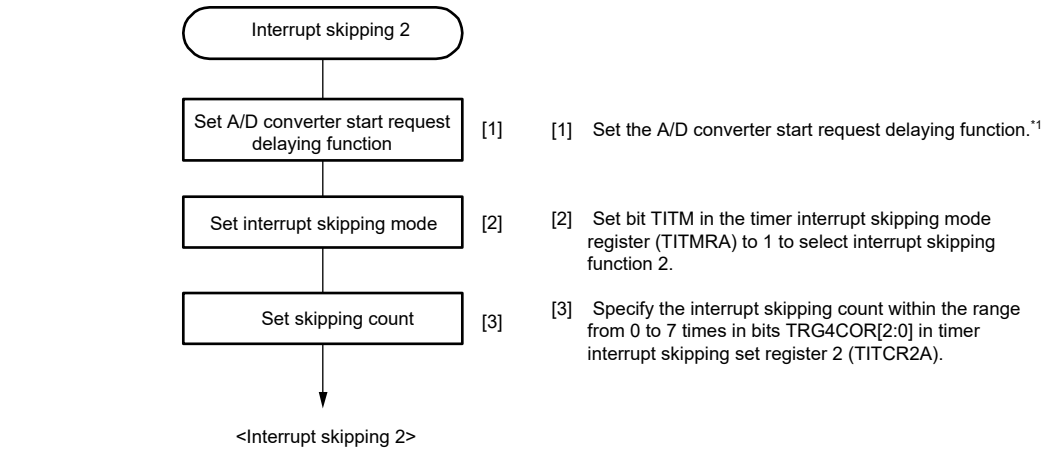
18.4.9.5 A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D converter request delaying function is enabled.

(1) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 18.97 shows an example of procedure for setting interrupt skipping function 2.



Note 1. For details, see section 18.4.9.1. Example of Procedure for Specifying A/D Converter Start Request Delaying Function.

Figure 18.97 Example of procedure for setting interrupt skipping function 2

(2) Example of Interrupt Skipping Function 2 Operation

Figure 18.98 shows an example of interrupt skipping function 2 operation.

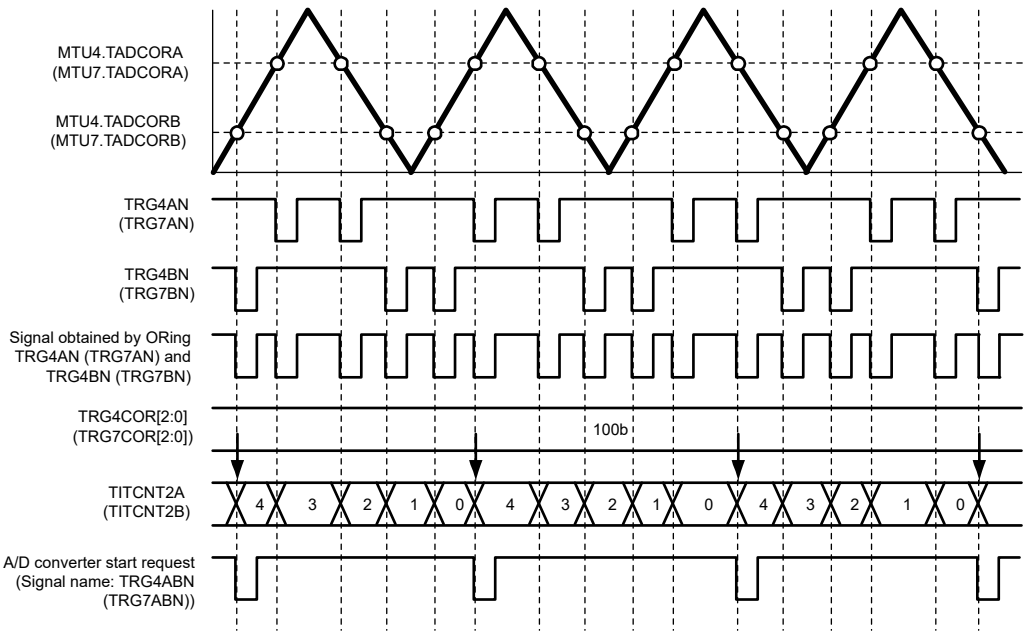


Figure 18.98 Example of interrupt skipping function 2 operation (skipping count is set to four)

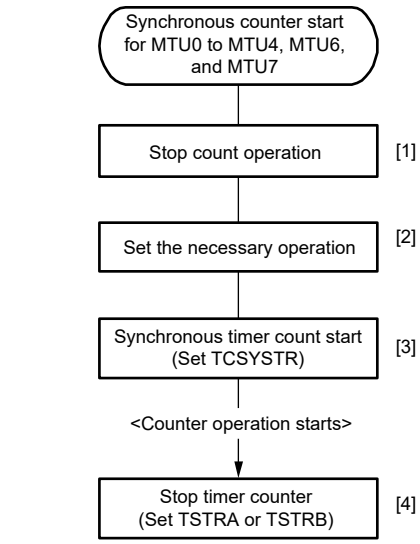
18.4.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

18.4.10.1 Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(1) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

Figure 18.99 shows an example of procedure for setting synchronous counter start for MTU0 to MTU4, MTU6, and MTU7.



[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

[4] To stop a timer counter, set the bit in TSTRA or TSTRB that corresponds to the counter to 0.

Note:
- Even if a bit in TCSYSTR corresponding to an operating counter is set to 0, the counter will not stop.
- To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU3, MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 18.99 Example of procedure for setting synchronous counter start for MTU0 to MTU4, MTU6, and MTU7

(2) Examples of Synchronous Counter Start Operation

Figure 18.100 shows an examples of synchronous counter start operation for MTU0 to MTU4, MTU6, and MTU7.

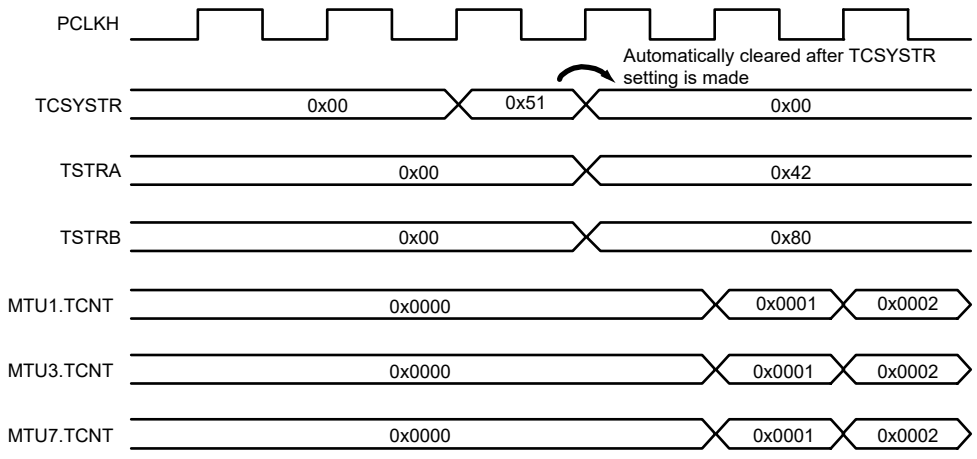


Figure 18.100 Examples of synchronous counter start operation for MTU0 to MTU4, MTU6, and MTU7

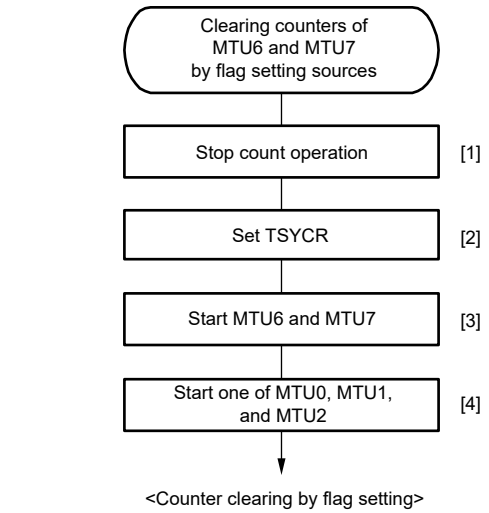
18.4.10.2 Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(1) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 18.101 shows an example of procedure for specifying synchronous counter clearing for MTU6 and MTU7 by flag setting sources.



[1] Set TSTRA and TSTRB to stop the counters used for this function.

[2] Use TSYCR to specify the source to be used for the MTU6.TCNT and MTU7.TCNT counter clearing.

[3] Start MTU6.TCNT or MTU7.TCNT.

[4] Start MTU0.TCNT, MTU1.TCNT, or MTU2.TCNT.

Note: The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 18.101 Example of procedure for specifying synchronous counter clearing for MTU6 and MTU7

(2) Examples of Synchronous Counter Clearing for MTU6 and MTU7

Figure 18.102 and Figure 18.103 show examples of synchronous counter clearing for MTU6 and MTU7 by flag setting sources.

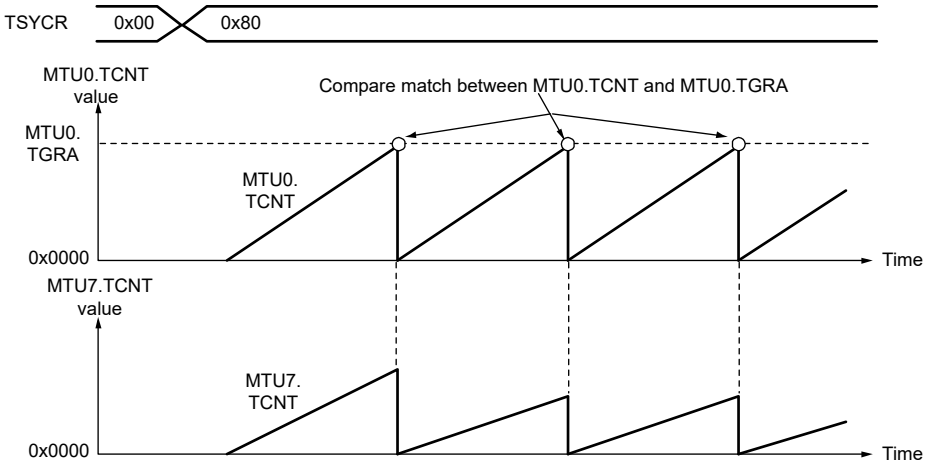


Figure 18.102 Example of synchronous counter clearing for MTU6 and MTU7 (1)

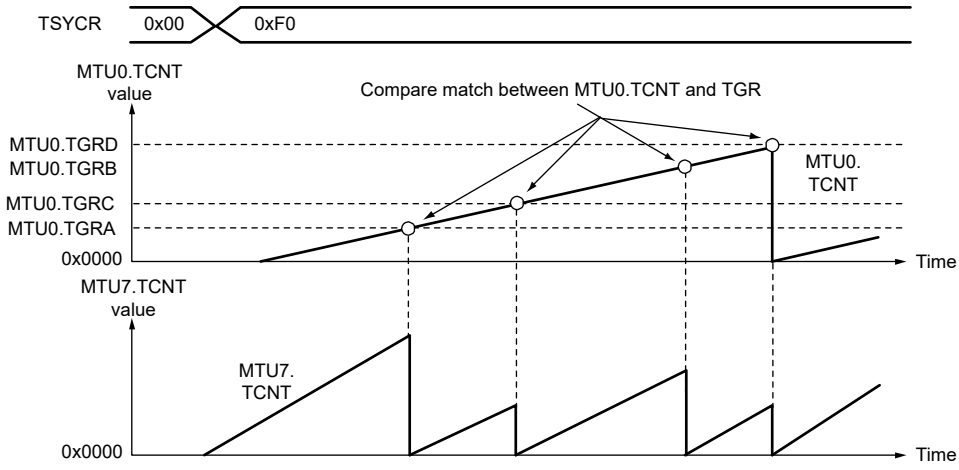

Figure 18.103 Example of synchronous counter clearing for MTU6 and MTU7 (2)

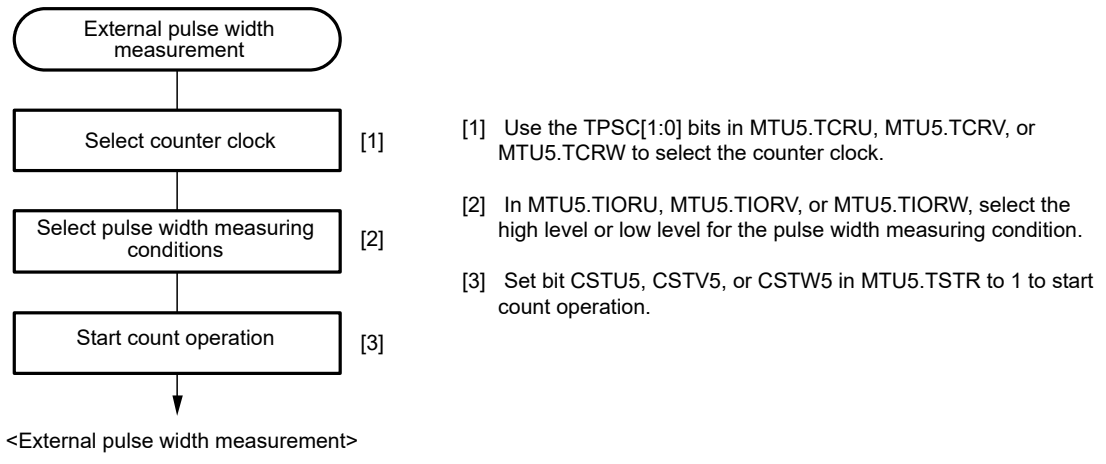
18.4.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

Figure 18.104 shows an example of setting external pulse width measurement and Figure 18.105 an example of external pulse width measurement.



Note:
- Set bit CMPCLR5U, CMPCLR5V, and CMPCLR5W in TCNTCMPCLR to 0.
- Set bit TGIE5U, TGIE5V, and TGIE5W in MTU5.TIER to 0.
- The value in TCNT is not captured in TGR.

Figure 18.104 Example of external pulse width measurement setting procedure

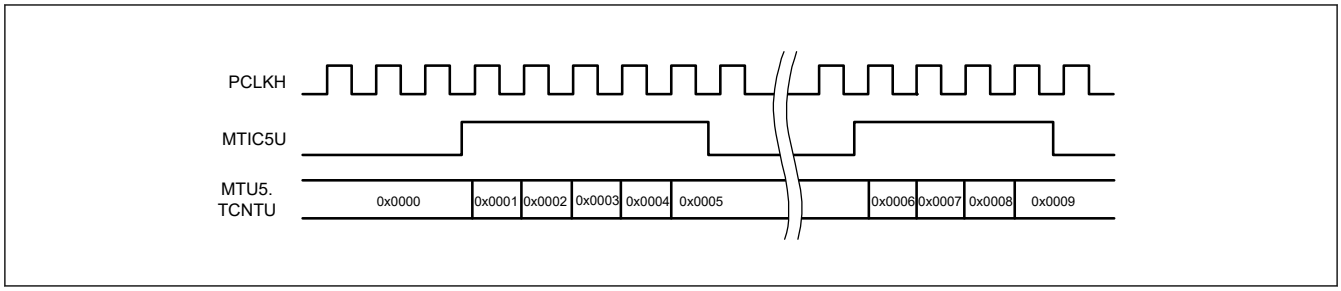


Figure 18.105 Example of external pulse width measurement (measuring high pulse width)

18.4.12 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The MTU5 external pulse width measurement function allows to transfer the value in TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crest, or trough, or crest and trough when MTU6 and MTU7 operate in complementary PWM mode. The transfer timing is set in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register are set to 1, TCNTU, TCNTV, and TCNTW become 0x0000 at the transfer timing for TGRU, TGRV, and TGRW.

Figure 18.106 shows an operation example in which MTU5.TCNTU is used as a free-running counter without being cleared, and the value is captured in TGR at the crest and trough in complementary PWM mode.

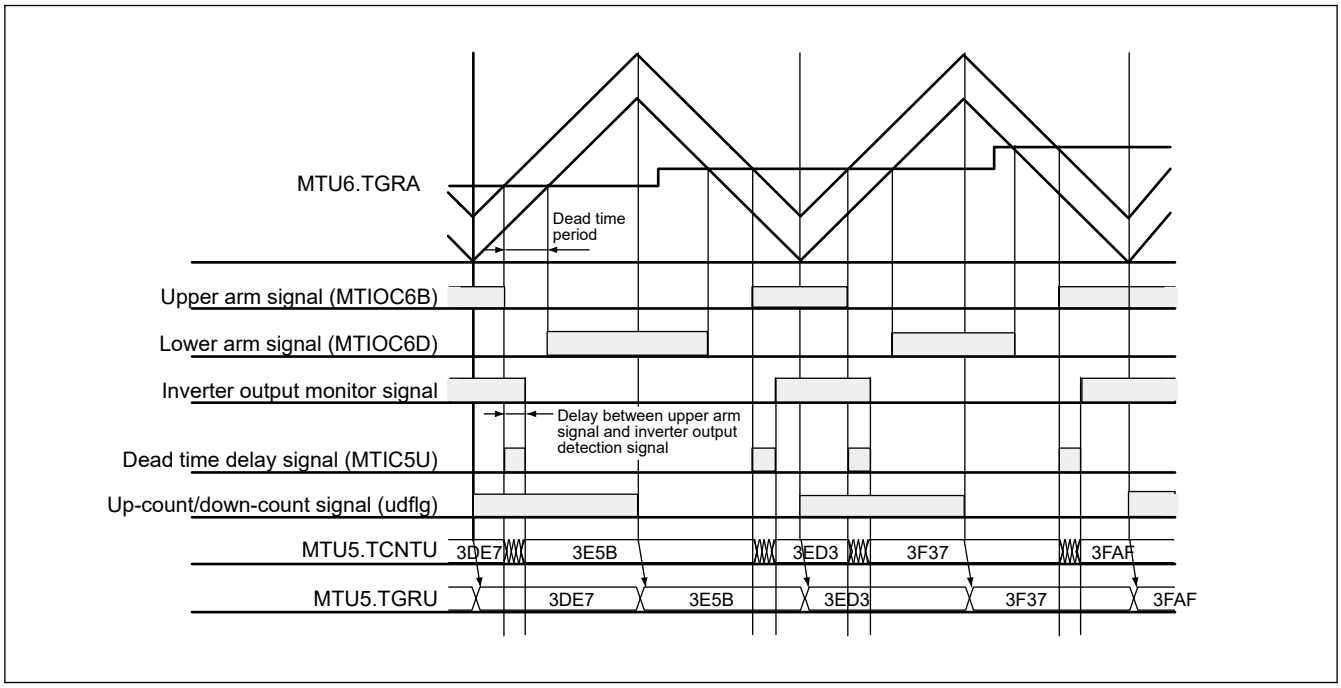

Figure 18.106 TCNTU capture at crest and trough in complementary PWM operation

18.4.13 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 8, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

Figure 18.107 shows the timing of noise filtering.

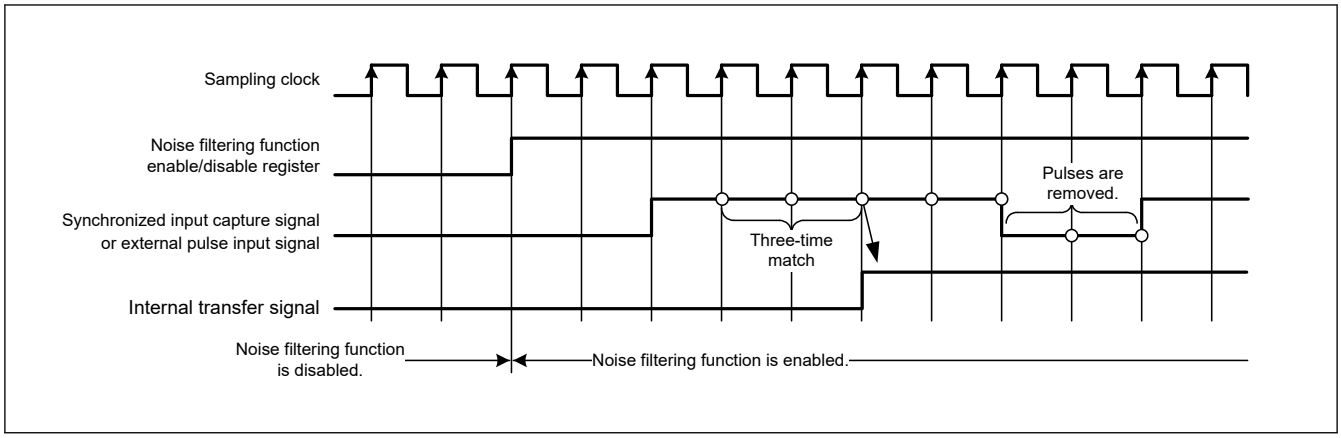

Figure 18.107 Timing of noise filtering

18.5 Interrupt Sources

18.5.1 Interrupt Sources and Priorities

There are three kinds of MTU interrupt sources:

- TGR input capture/compare match
- TCNT overflow
- TCNT underflow

Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller. For details, see section 12, Interrupt Controller (ICU). Table 18.74 lists the MTU interrupt sources.

Table 18.74 MTU interrupt sources

Channel	Name	Interrupt source	DMAC activation	Priority
MTU0	TGIA0	ch0 input capture/compare match A interrupt	Possible	High
	TGIB0	ch0 input capture/compare match B interrupt	Possible	↑
	TGIC0	ch0 input capture/compare match C interrupt	Possible	↑
	TGID0	ch0 input capture/compare match D interrupt	Possible	↑
	TCIV0	ch0 overflow interrupt	Not possible	↑
	TGIE0	ch0 compare match E interrupt	Not possible	↑
	TGIF0	ch0 compare match F interrupt	Not possible	↑
MTU1	TGIA1	ch1 input capture/compare match A interrupt	Possible	↑
	TGIB1	ch1 input capture/compare match B interrupt	Possible	↑
	TCIV1	ch1 overflow interrupt	Not possible	↑
	TCIU1	ch1 underflow interrupt	Not possible	↑
MTU2	TGIA2	ch2 input capture/compare match A interrupt	Possible	↑
	TGIB2	ch2 input capture/compare match B interrupt	Possible	↑
	TCIV2	ch2 overflow interrupt	Not possible	↑
	TCIU2	ch2 underflow interrupt	Not possible	↑
MTU3	TGIA3	ch3 input capture/compare match A interrupt	Possible	↑
	TGIB3	ch3 input capture/compare match B interrupt	Possible	↑
	TGIC3	ch3 input capture/compare match C interrupt	Possible	↑
	TGID3	ch3 input capture/compare match D interrupt	Possible	↑
	TCIV3	ch3 overflow interrupt	Not possible	↑
MTU4	TGIA4	ch4 input capture/compare match A interrupt	Possible	↑
	TGIB4	ch4 input capture/compare match B interrupt	Possible	↑
	TGIC4	ch4 input capture/compare match C interrupt	Possible	↑
	TGID4	ch4 input capture/compare match D interrupt	Possible	↑
	TCIV4	ch4 overflow/underflow interrupt*1	Possible	↑
MTU5	TGIU5	ch5 input capture/compare match U interrupt	Possible	↑
	TGIV5	ch5 input capture/compare match V interrupt	Possible	↑
	TGIW5	ch5 input capture/compare match W interrupt	Possible	↑
MTU6	TGIA6	ch6 compare match A interrupt	Possible	↑
	TGIB6	ch6 compare match B interrupt	Possible	↑
	TGIC6	ch6 compare match C interrupt	Possible	↑
	TGID6	ch6 compare match D interrupt	Possible	↑
	TCIV6	ch6 overflow interrupt	Not possible	↑
MTU7	TGIA7	ch7 compare match A interrupt	Possible	↑
	TGIB7	ch7 compare match B interrupt	Possible	↑
	TGIC7	ch7 compare match C interrupt	Possible	↑
	TGID7	ch7 compare match D interrupt	Possible	↑
	TCIV7	ch7 overflow/underflow interrupt*1	Possible	↑
MTU8	TGIA8	ch8 compare match A interrupt	Possible	↑
	TGIB8	ch8 compare match B interrupt	Possible	↑
	TGIC8	ch8 compare match C interrupt	Possible	↑
	TGID8	ch8 compare match D interrupt	Possible	↑
	TCIV8	ch8 overflow interrupt	Not possible	Low

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.
Note 1. Only in complementary PWM mode.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, an interrupt is requested. The MTU has eight overflow interrupts (one for each channel).

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1 and MTU2).

18.5.2 DMAC Trigger Sources

The DMAC can be triggered by the TGR input capture/compare match interrupt in each channel and the overflow interrupt in MTU4 and MTU7. For details, see section 15, DMA Controller (DMAC).

The MTU provides a total of 33 input capture/compare match interrupts and overflow interrupts that can be used as DMAC trigger sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

18.5.3 A/D Converter Trigger Sources

The A/D converter can be triggered by one of the following three methods in the MTU. Table 18.75 shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Conversion Start by MTUn.TGRA (n = 0 to 4, 6, 7) Input Capture/Compare Match or at Trough of MTUm.TCNT (m = 4 or 7) in Complementary PWM Mode

The A/D converter can be triggered by the occurrence of a TGRA input capture/compare match in channels 0 to 4, 6, and 7. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER is set to 1, the A/D converter can be triggered at the trough of MTUm.TCNT count (MTUm.TCNT = 0x0000) (m = 4 or 7).

A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTGE bit is set to 1
- When the MTUm.TCNT count reaches the trough (MTUm.TCNT = 0x0000) during complementary PWM operation while the TTGE2 bit in MTUm.TIER is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Conversion Start by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE while the TTGE2 bit in MTU0.TIER2 is set to 1, A/D converter start request TRG0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Conversion Start by A/D Converter Start Request Delaying Function (MTU4 and MTU7)

The A/D converter can be triggered by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, see section 18.4.9. A/D Converter Start Request Delaying Function.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 18.75 Interrupt sources and A/D converter start request signals

Target registers	Interrupt source	A/D converter start request signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	TRGA7N
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT		TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated. When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA/TADCORB (MTU7.TADCORA/TADCORB).

18.6 Operation Timing

18.6.1 Input/Output Timing

18.6.1.1 TCNT Count Timing

Figure 18.108 and Figure 18.109 show the TCNT count timing in internal clock operation, Figure 18.110 shows the TCNT count timing in external clock operation (normal mode), and Figure 18.111 shows the TCNT count timing in external clock operation (phase counting mode).

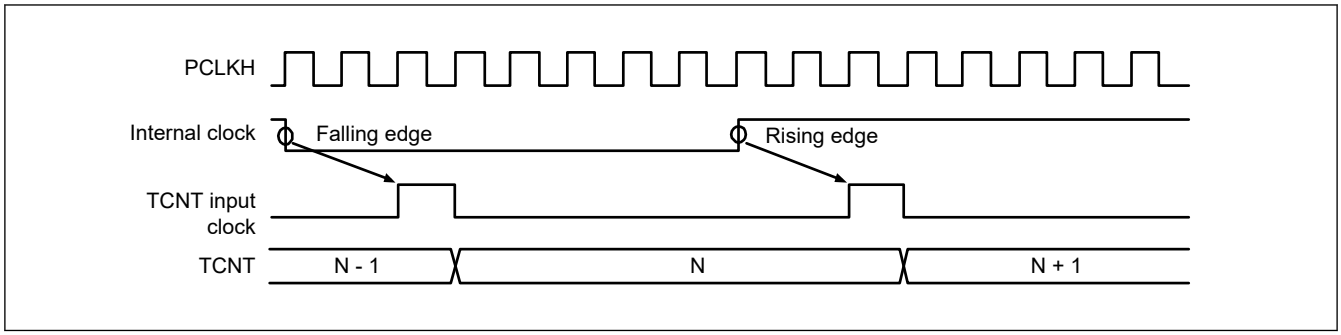

Figure 18.108 Count timing in internal clock operation (MTU0 to MTU4 and MTU6 to MTU8)

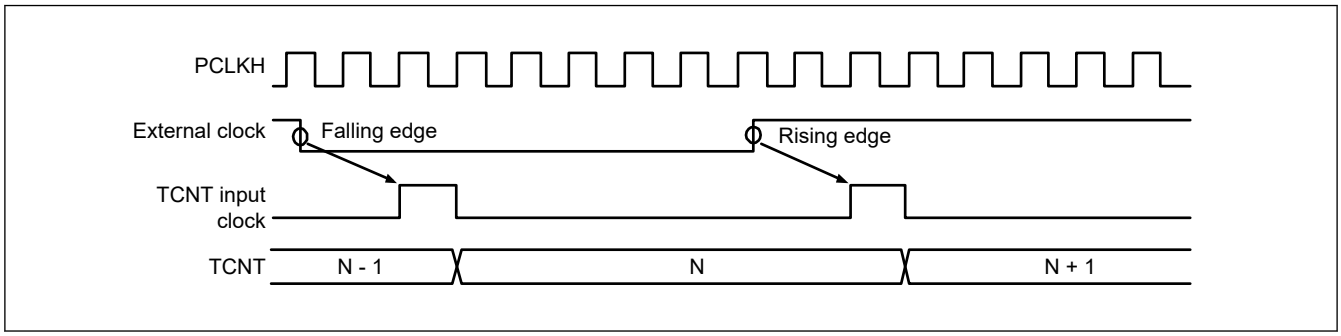

Figure 18.110 Count timing in external clock operation (MTU0 to MTU4 and MTU6 to MTU8)

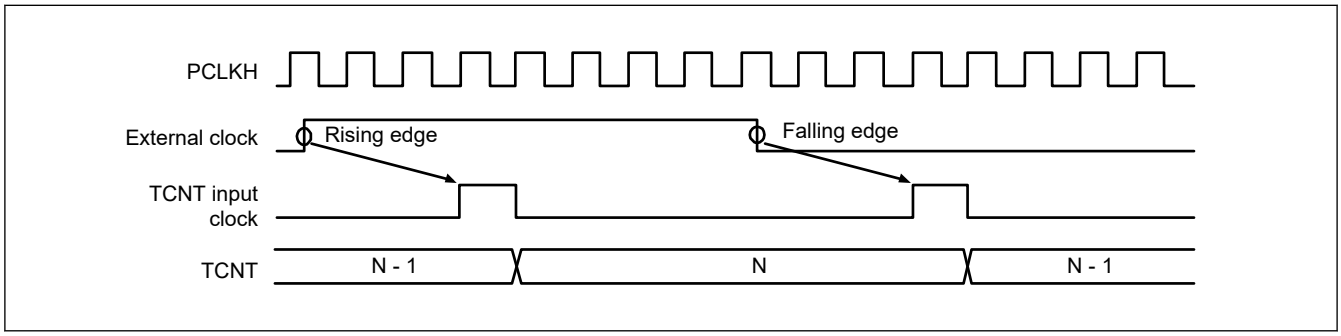

Figure 18.111 Count timing in external clock operation (phase counting mode)

18.6.1.2 Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 18.112 shows the output compare output timing (normal mode or PWM mode) and Figure 18.113 shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

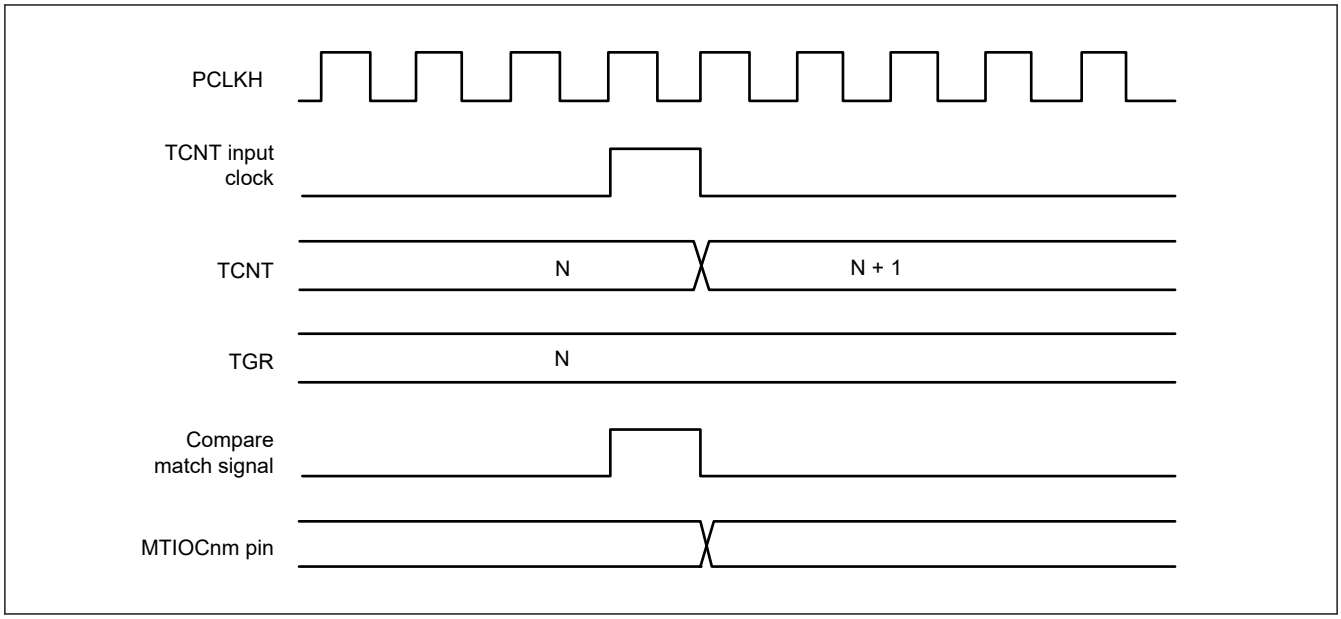

Figure 18.112 Output compare output timing (normal mode or PWM mode) (n = 0 to 4, 6, 7, 8; m = A to D)

18.7 Usage Notes

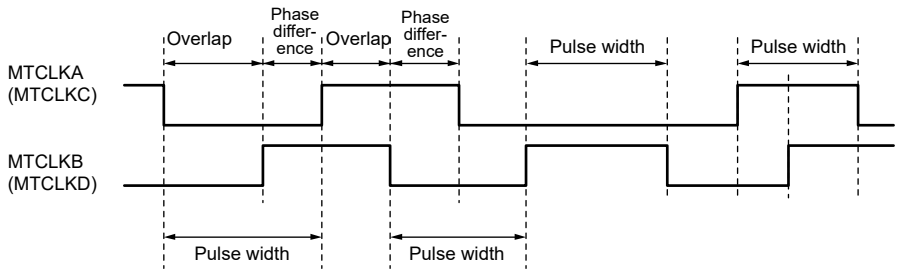
18.7.1 Module Stop Function Setting

MTU operation can be disabled or enabled using the module stop control register. MTU operation is stopped with the initial setting. Register access is enabled by releasing the module clock stop state. For details, see section 9, Low-Power Consumption Function.

18.7.2 Input Clock Restrictions

The input clock pulse width must be at least three PCLKH cycles for single-edge detection, and at least five PCLKH cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least three PCLKH cycles, and the pulse width must be at least five PCLKH cycles. Figure 18.130 shows the input clock conditions in phase counting mode.



Note: Phase difference and overlap: 3 PCLKH cycles or more.
Pulse width: 5 PCLKH cycles or more.

Figure 18.130 Phase difference, overlap, and pulse width in phase counting mode

18.7.3 Note on Period Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNT updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8
  $f = \frac{CNTCLK}{N+1}$
- MTU5
  $f = \frac{CNTCLK}{N}$

f: Counter frequency

CNTCLK: The counter clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

18.7.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 18.131 shows the timing in this case.

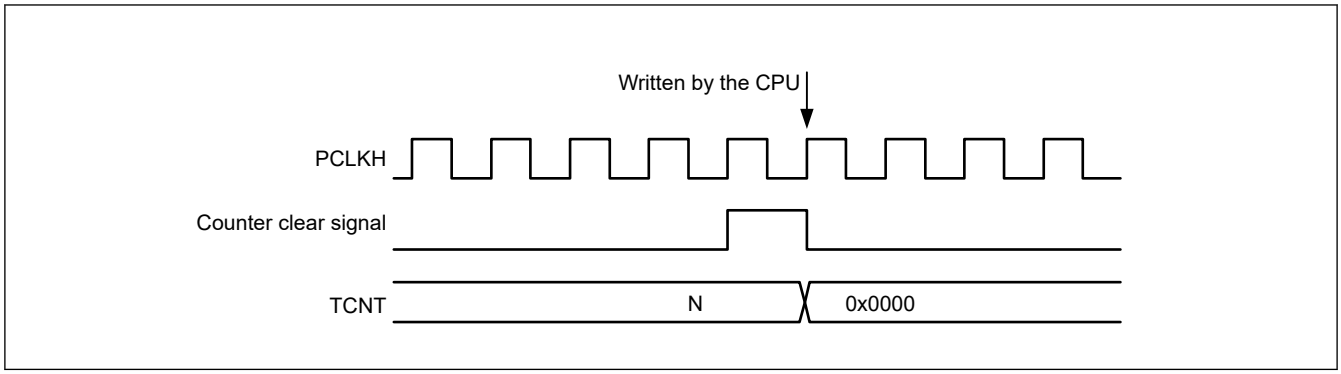


Figure 18.131 Contention between TCNT write and clear operations

18.7.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 18.132 shows the timing in this case.

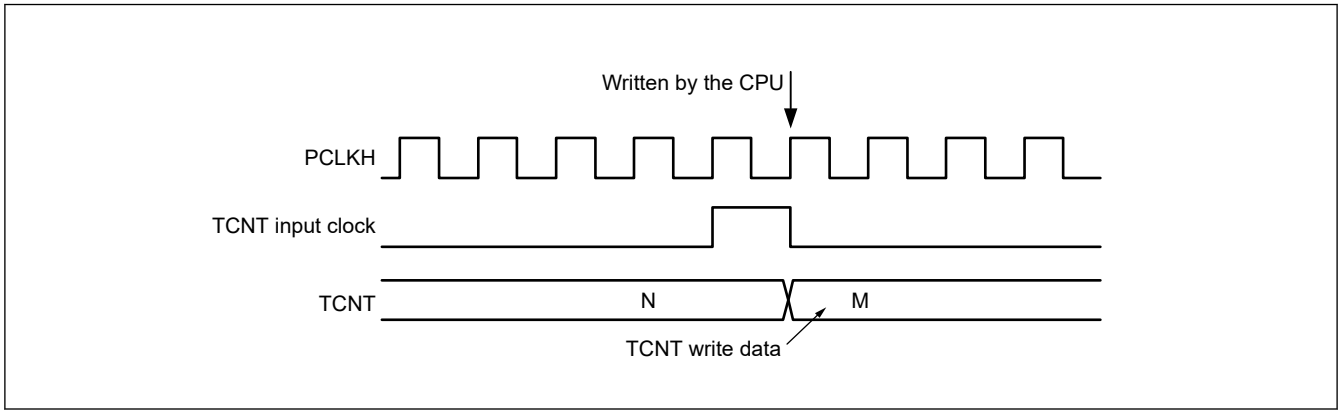

Figure 18.132 Contention between TCNT write and increment operations

18.7.6 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 18.133 shows the timing in this case.

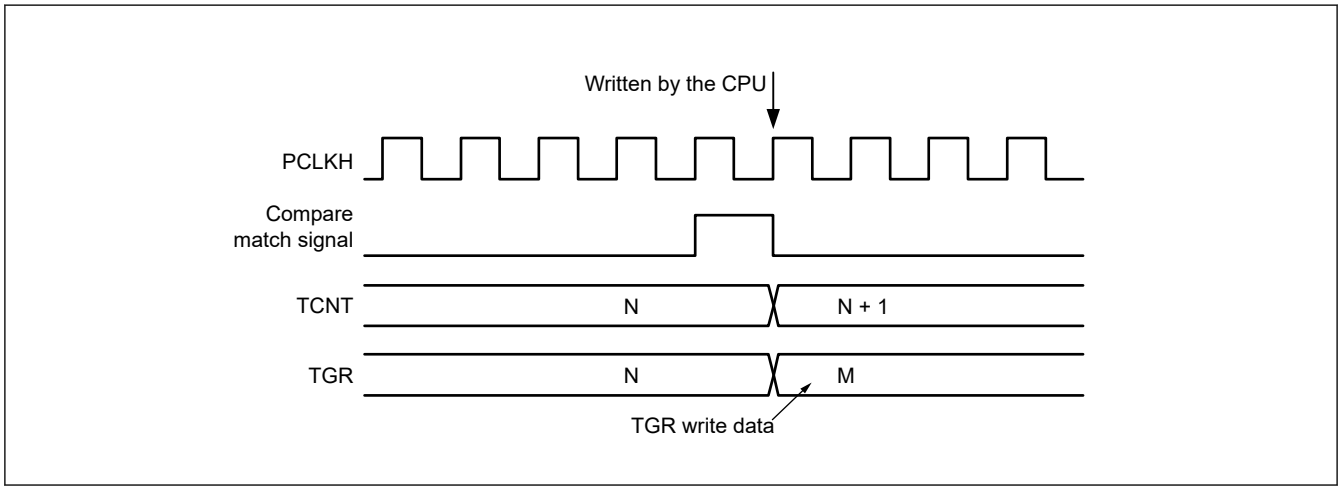

Figure 18.133 Contention between TGR write operation and compare match

18.7.7 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 18.134 shows the timing in this case.

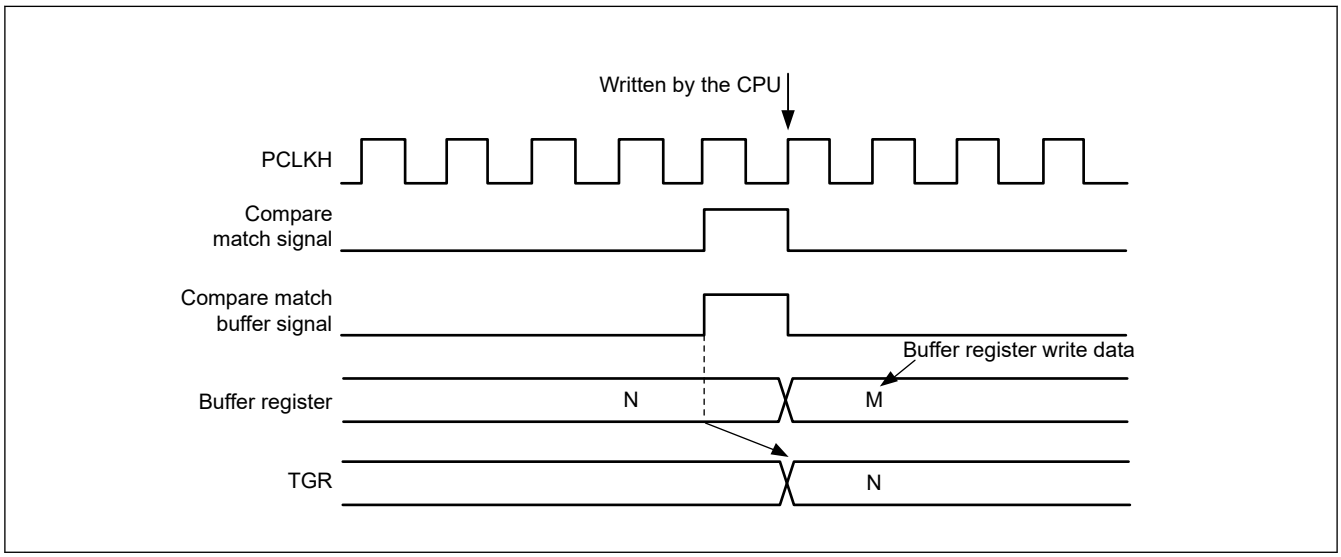

Figure 18.134 Contention between buffer register write operation and compare match

18.7.8 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set at the TCNT clear timing by the timer buffer operation transfer mode register (TBTM), if TCNT clearing occurs in the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 18.135 shows the timing in this case.

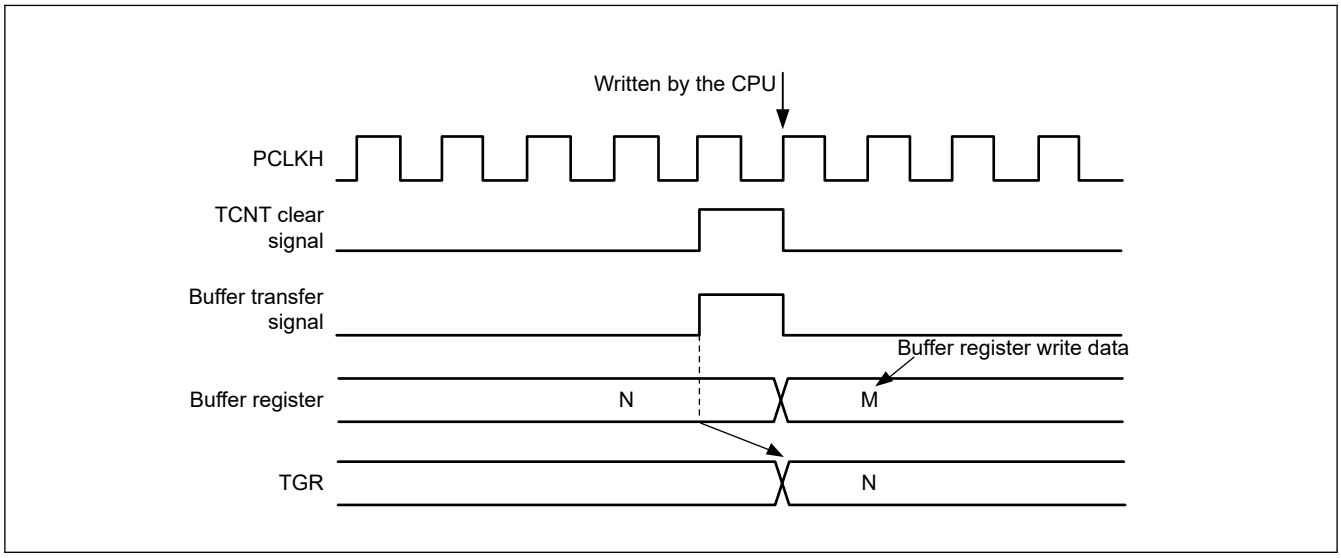

Figure 18.135 Contention between buffer register write and TCNT clear operations

18.7.9 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in the TGR read cycle, the data before input capture transfer is read.

Figure 18.136 shows the timing in this case.

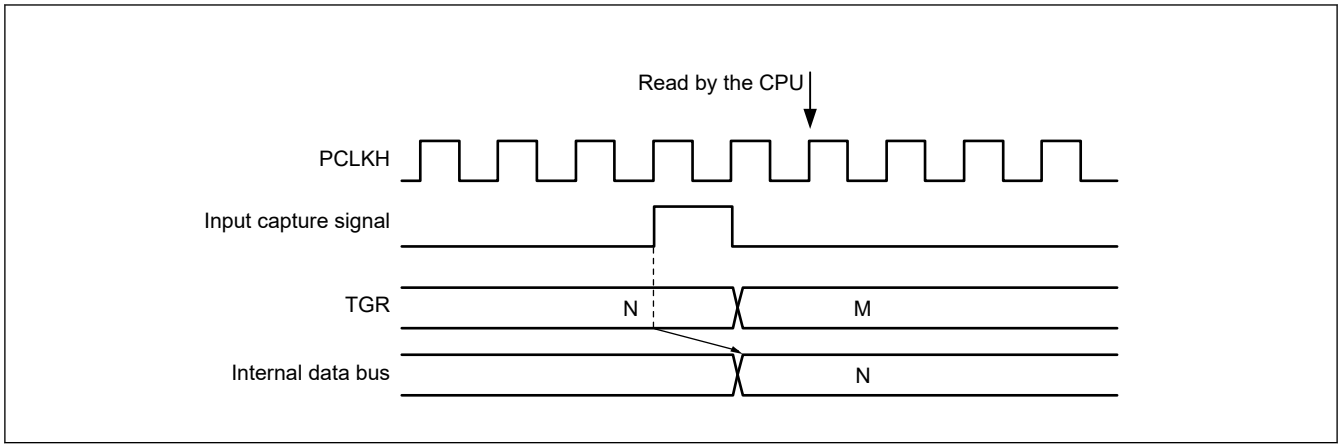

Figure 18.136 Contention between TGR read operation and input capture (MTU0 to MTU8)

18.7.10 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in a TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.

Figure 18.137 and Figure 18.138 show the timing in this case.

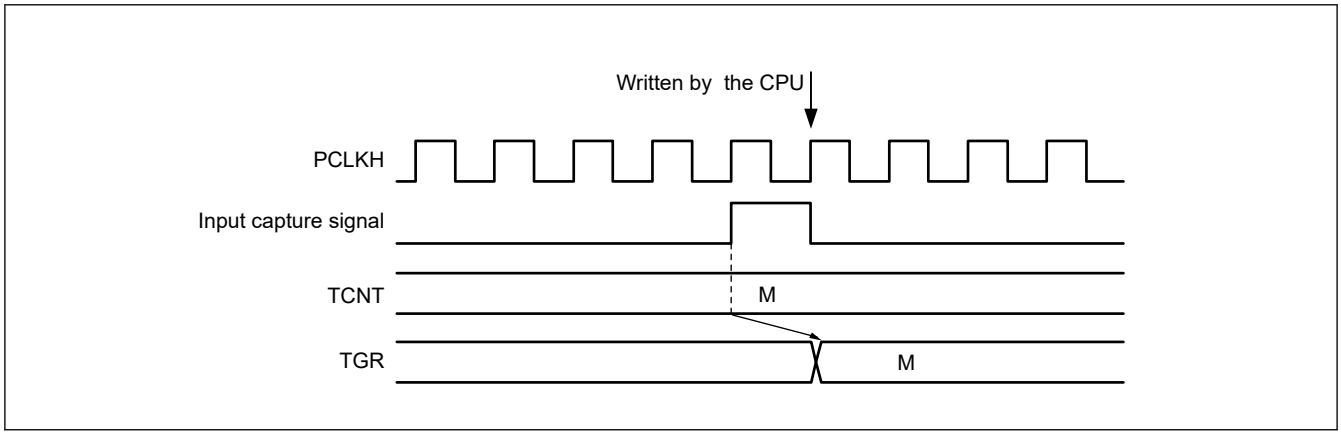

Figure 18.137 Contention between TGR write operation and input capture (MTU0 to MTU4, MTU6 to MTU8)

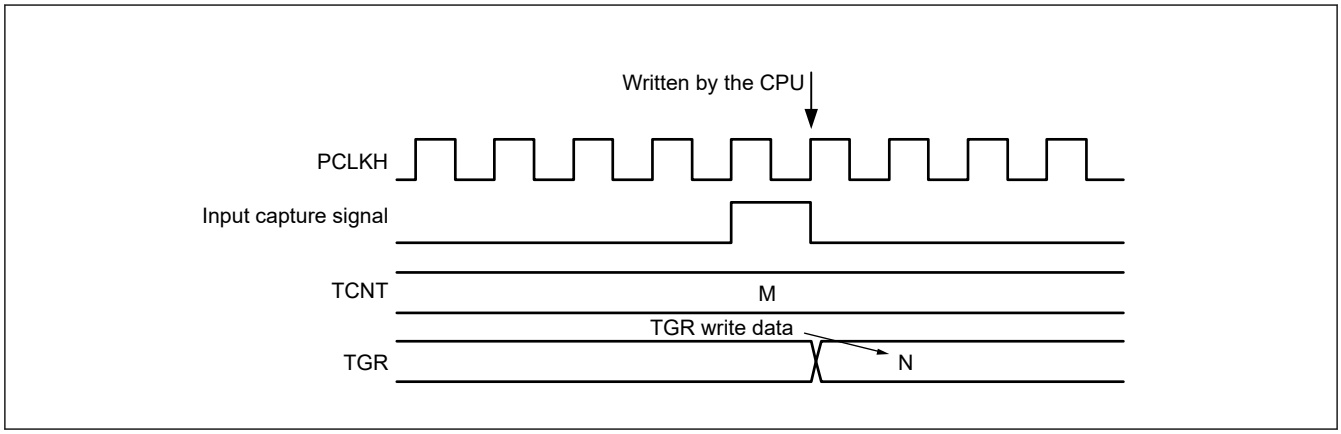

Figure 18.138 Contention between TGR write operation and input capture (MTU5)

18.7.11 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in a buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 18.139 shows the timing in this case.

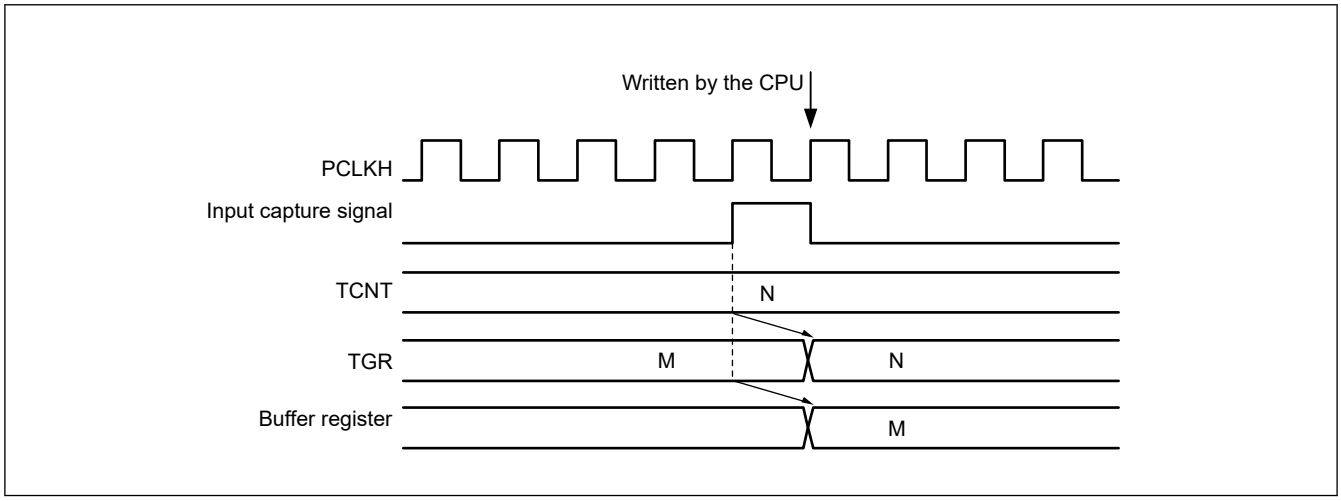

Figure 18.139 Contention between buffer register write operation and input capture

18.7.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters MTU1.TCNT and MTU2.TCNT in a cascade, when a contention occurs between MTU1.TCNT counting (an MTU2.TCNT overflow/underflow) and the MTU2.TCNT write operation, the MTU2.TCNT write operation is performed and the MTU1.TCNT count signal is disabled. In this case, if MTU1.TGRA works as a compare match register and there is a match between the MTU1.TGRA and MTU1.TCNT values, a compare match signal is issued.

Furthermore, when the MTU1.TCNT count clock is selected as the input capture source of MTU0, MTU0.TGRA to MTU0.TGRD work in input capture mode. In addition, when the MTU0.TGRC compare match/input capture is selected as the input capture source of MTU1.TGRB, MTU1.TGRB works in input capture mode.

Figure 18.140 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

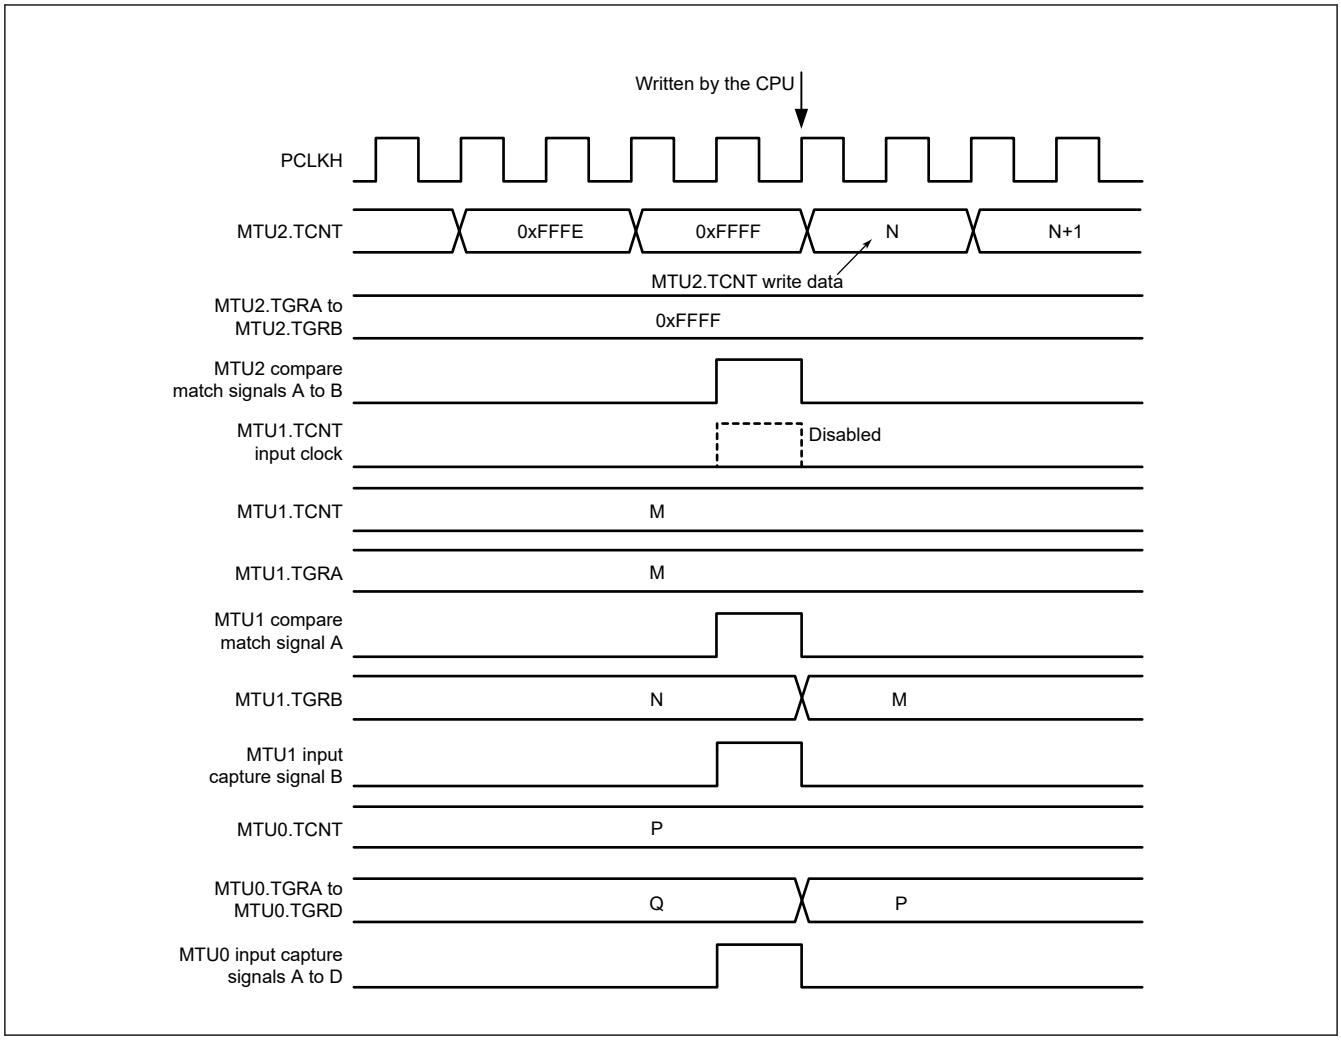

Figure 18.140 Contention between MTU2.TCNT write operation and overflow/underflow in cascaded operation

18.7.13 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time data register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to 0x0000.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state.

Figure 18.141 shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

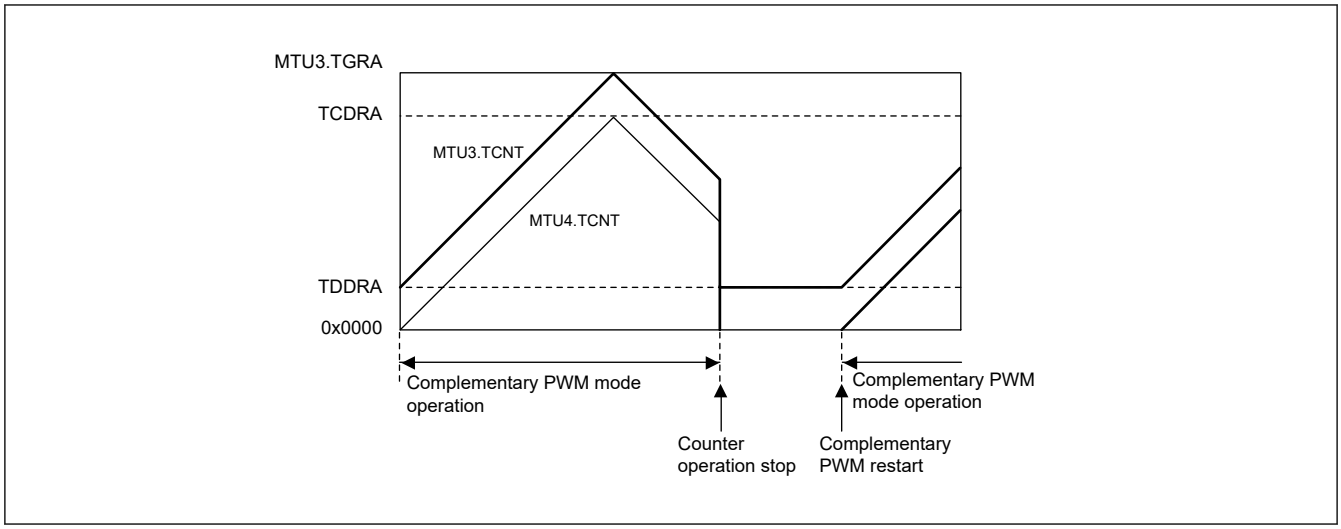

Figure 18.141 Counter value when stopped in complementary PWM mode

18.7.14 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM period set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

18.7.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C, D; n = 3, 4 or 6, 7) is not generated.

Figure 18.142 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

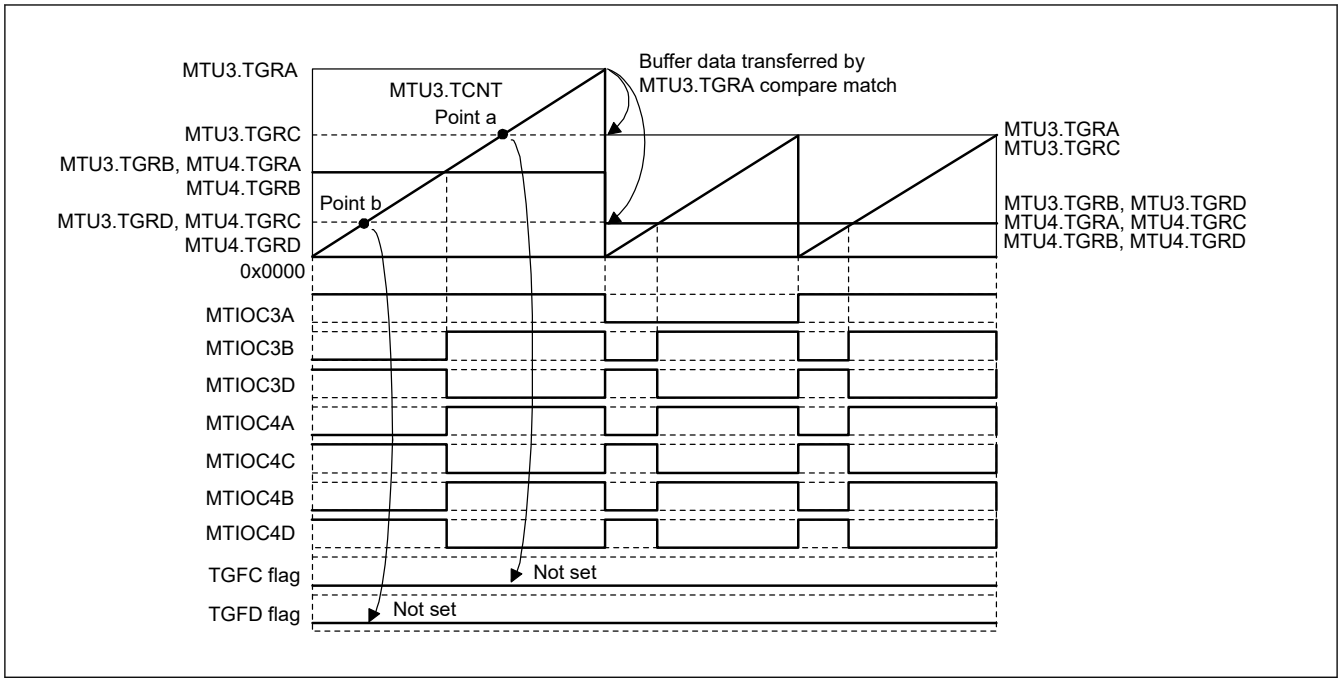

Figure 18.142 Buffer operation and compare match in reset-synchronized PWM mode

18.7.16 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the MTU4.TCNT (MTU7.TCNT) count clock source and count edge are determined by the MTU3.TCR (MTU6.TCR) setting.

In reset-synchronized PWM mode, with period register MTU3.TGRA (MTU6.TGRA) set to 0xFFFF and the MTU3.TGRA (MTU6.TGRA) compare match selected as the counter clearing source, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) count up to 0xFFFF, then a compare match occurs with MTU3.TGRA (MTU6.TGRA), and MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) are both cleared. In this case, a TCIVn interrupt (n = 3, 4 or 6, 7) is not generated.

Figure 18.143 shows an example of operation in reset-synchronized PWM mode with period register MTU3.TGRA (MTU6.TGRA) set to 0xFFFF and the MTU3.TGRA (MTU6.TGRA) compare match specified for the counter clearing source.

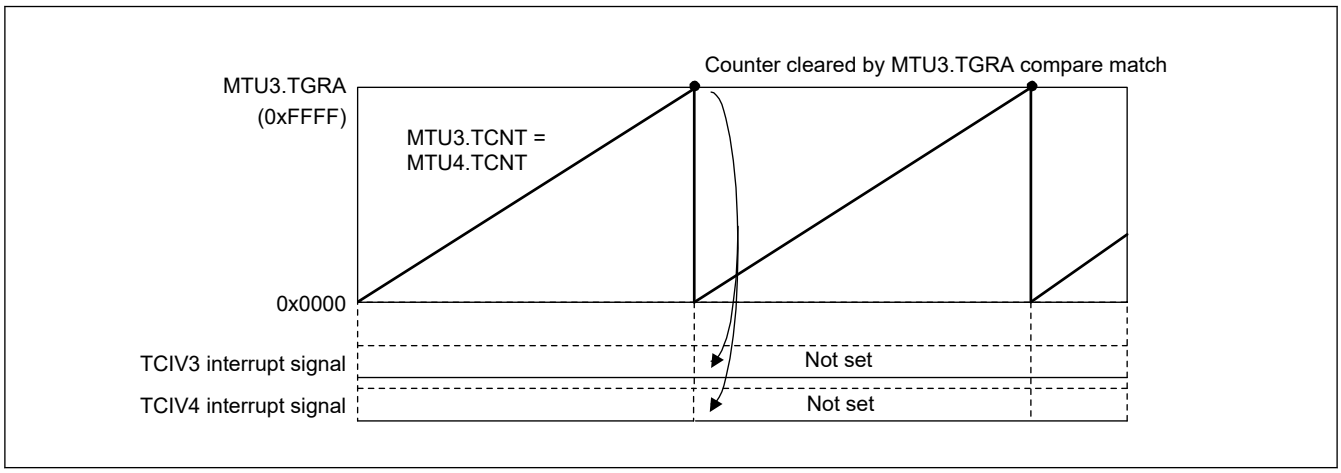

Figure 18.143 Overflow in reset-synchronized PWM mode

18.7.17 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, neither a TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1, 2) is generated and TCNT clearing takes precedence.

Figure 18.144 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to 0xFFFF.

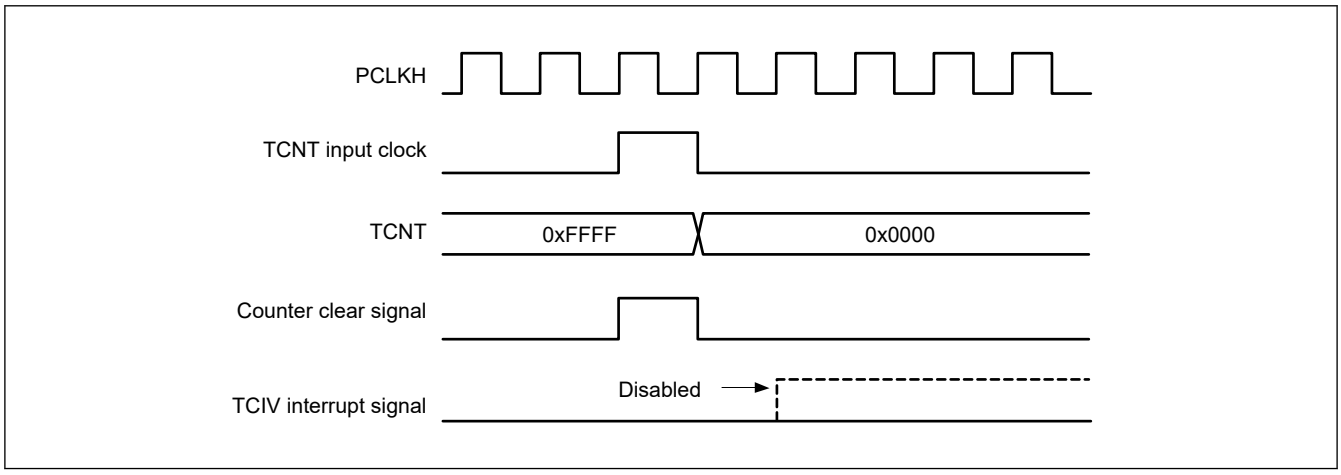

Figure 18.144 Contention between overflow and counter clearing

18.7.18 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1, 2) is not generated.

Figure 18.145 shows the operation timing when there is contention between TCNT write operation and overflow.

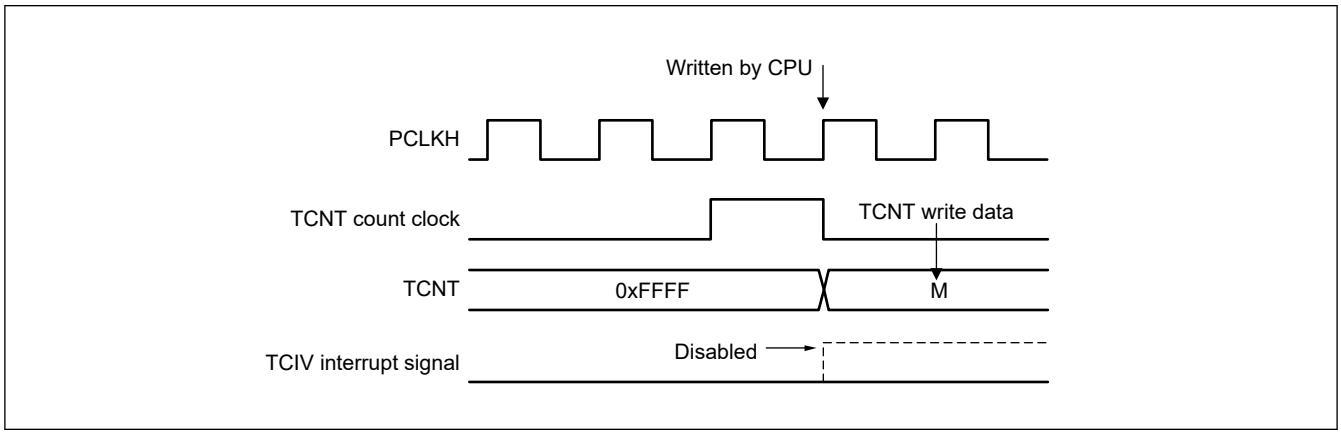

Figure 18.145 Contention between TCNT write operation and overflow

18.7.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal operation or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write 0x11 to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (0x00) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (0x00) before making the transition to reset-synchronized PWM mode.

18.7.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to 0x00.

The output level in negative phase when the TDERA.TDER (TDERB.TDER) bit is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the TOCR1A.OLSN (TOCR1B.OLSN) bit. It is equivalent to the inverted level of positive phase output based on the setting of the TOCR1A.OLSP (TOCR1B.OLSP) bit.

18.7.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = 0xFFF1 and MTU2.TCNT = 0x0000 should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = 0xFFF0 and MTU2.TCNT = 0x0000 are erroneously transferred.

The MTU has a new function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input as the trigger. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see section 18.3.12. TICCR : Timer Input Capture Control Register.

18.7.22 Interrupt Skipping Function 2

When interrupt skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.

For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

1. When the number skipped is zero for skipping function 2
   - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
   - The interval of comparison for MTU4.TADCORA must be at least four cycles of PCLKH (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
   - The interval of comparison for MTU4.TADCORB must be at least four cycles of PCLKH (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).
2. When the number skipped is one or more for skipping function 2
   - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
   - The interval of comparison for MTU4.TADCORB must be at least two cycles of PCLKH (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

18.7.23 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. If it is not used, write 0x00 in the POE3.POECR2 register.

18.7.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set an MTU5.TGRj (j = U, V, W) bit to the value of the corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) register is stopped. If an MTU5.TGRj (j = U, V, W) bit is set to the value of

the corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) is stopped, a compare-match will be generated even though counting is stopped.

In this case, if the compare match enable bit (MTU5.TIER.TGIE5j (j = U, V, W) bit is set to 1 (enabling interrupts), a compare-match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the timer is automatically cleared to 0x0000 when the compare-match is generated, regardless of whether interrupts from the MTU5.TCNTj (j = U, V, W) are enabled or disabled.

18.7.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (TWCRA.WRE bit = 1 or TWCRB.WRE bit = 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

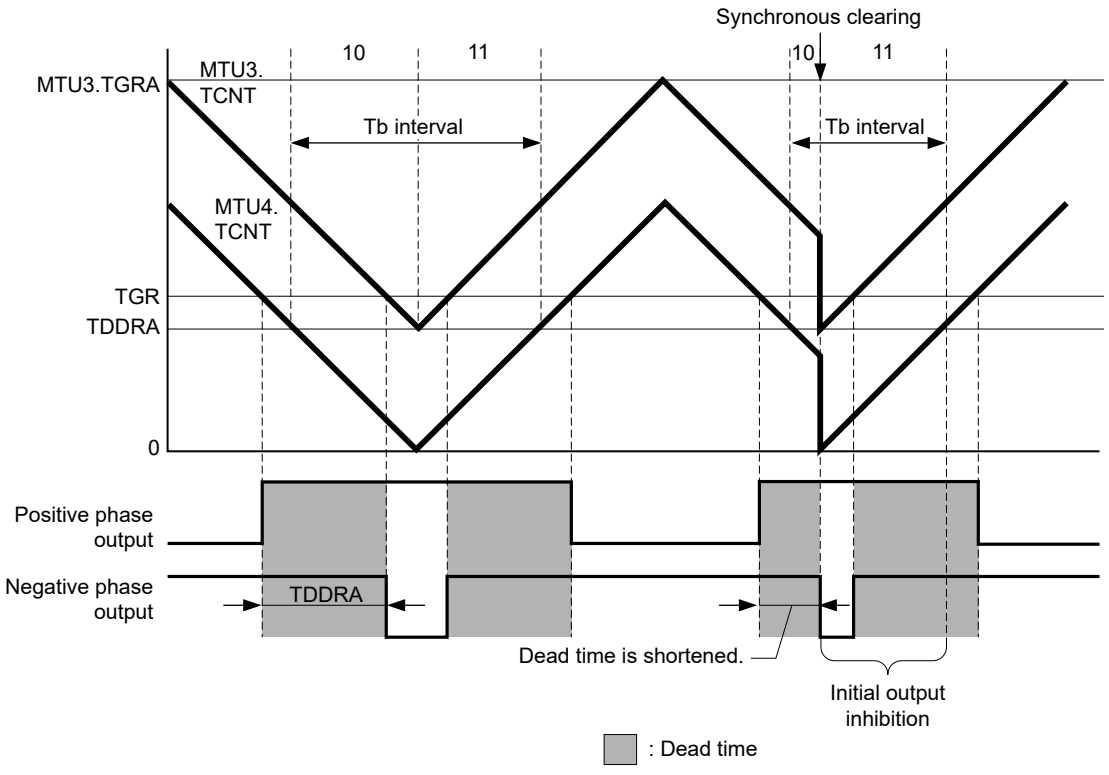
- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1: In portion (10) of the initial output inhibition period in Figure 18.146, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2: In portions (10) and (11) of the initial output inhibition period in Figure 18.147, synchronous clearing occurs when any condition from among MTU3.TGRB (MTU6.TGRB) ≤ TDDRA, MTU4.TGRA (MTU7.TGRA) ≤ TDDRA, or MTU4.TGRB (MTU7.TGRB) ≤ TDDRA is satisfied.

The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register (MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB)) set to at least double the value of the TDDRA register (TDDRB register).



Note: PWM output is active-low.

Figure 18.146 Example of synchronous clearing (when condition 1 applies)

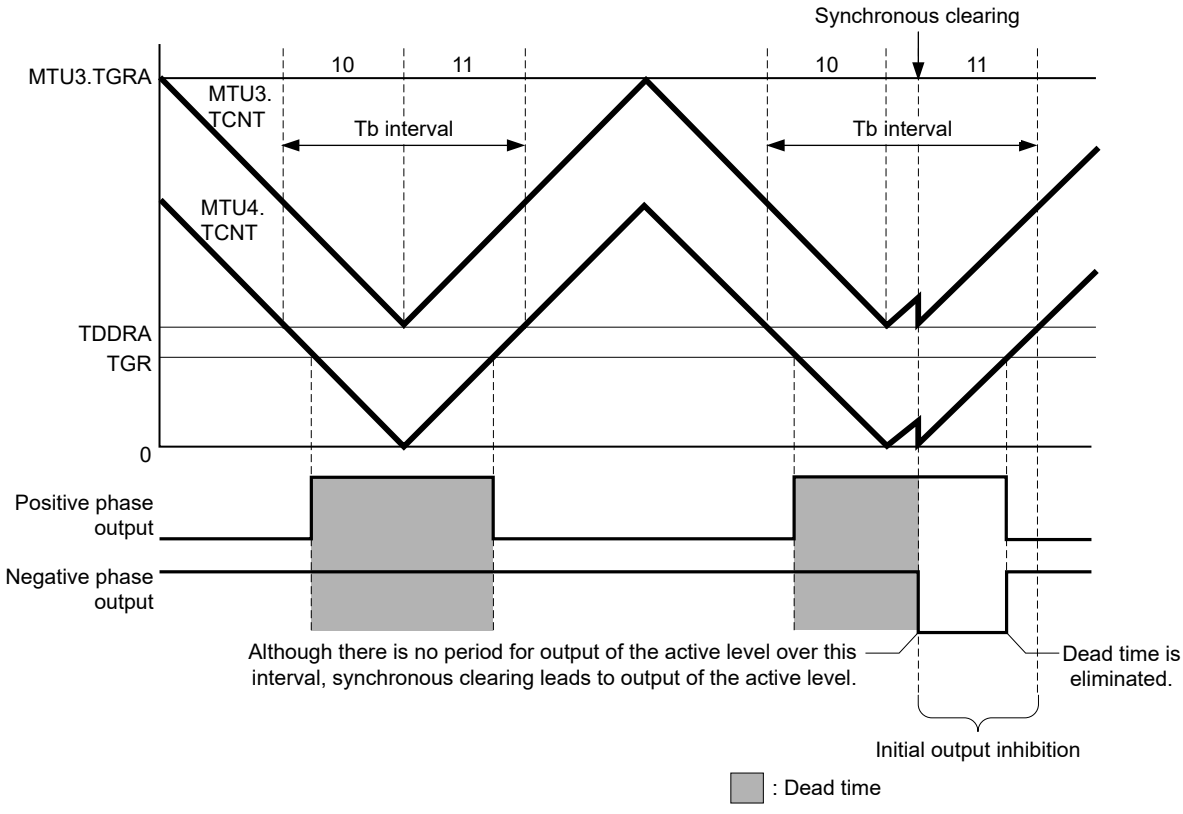


Figure 18.147 Example of synchronous clearing (when condition 2 Applies)

18.7.26 Notes on Timer Mode Register Setting for ELC Event Input

When MTU is used in ELC operation, set the timer mode register (TMDR) of the relevant channel to its initial value (0x00).

18.7.27 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to 0x0000, the PCLKH/1 clock is set as the counter clock, and compare match is set as the trigger for clearing of the counter clock, the value of the TCNT counter remains 0x0000, and the interrupt signal is output continuously (i.e. its level is flat) rather than output over a single cycle. Consequently, interrupts are not detected in response to second and subsequent compare matches.

Figure 18.148 shows the timing for continuous output of the interrupt signal in response to a compare match.

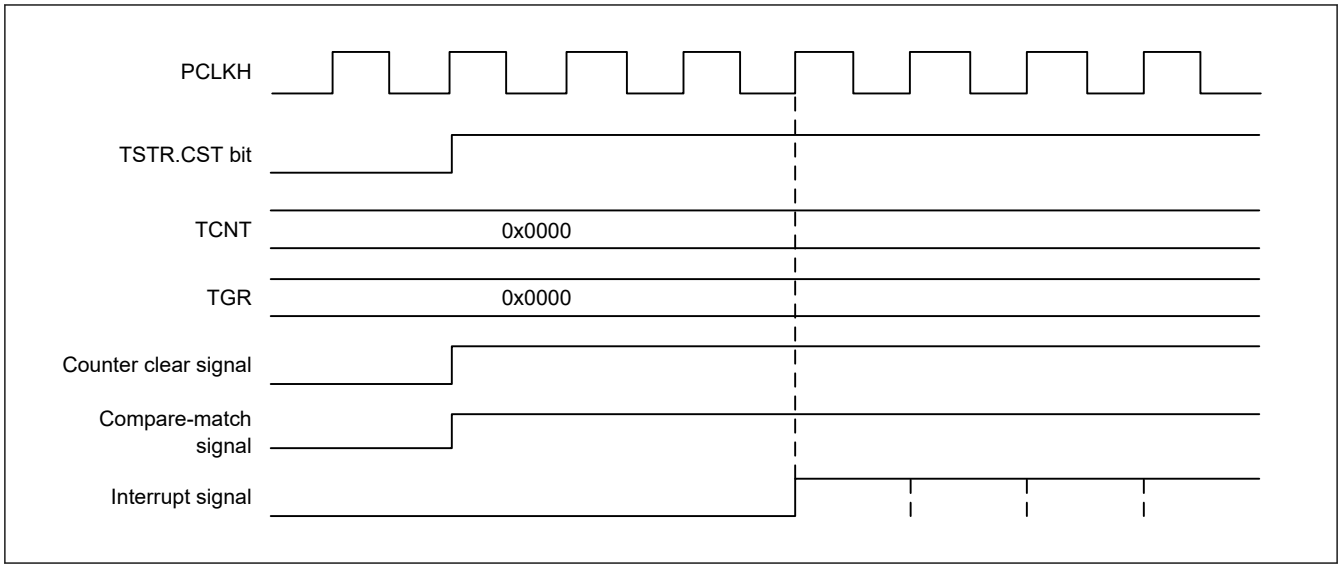

Figure 18.148 Continuous output of interrupt signal in response to a compare match

18.8 MTU Output Pin Initialization

18.8.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU7)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

18.8.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in Table 18.76.

Table 18.76 Mode transition combinations (1 of 2)

	Normal	PWM1	PWM2	PCM	CPWM	RPWM

CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

18.8.3 Overview of Initialization Procedures and Mode Transitions in Case of Error During Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD (n = 3, 4, 6, 7) pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In PWM mode 2, waveforms are not output to the cycle register pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the Timer Output Control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the Timer Output Master Enable register (TOERA or TOERB). At this time, if no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

Note: Channel number is substituted for "n" indicated in this section, unless otherwise stated.

Pin initialization procedures are described below for the numbered combinations in Table 18.76. The active level is assumed to be low.

18.8.3.1 Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 18.149 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after resetting.

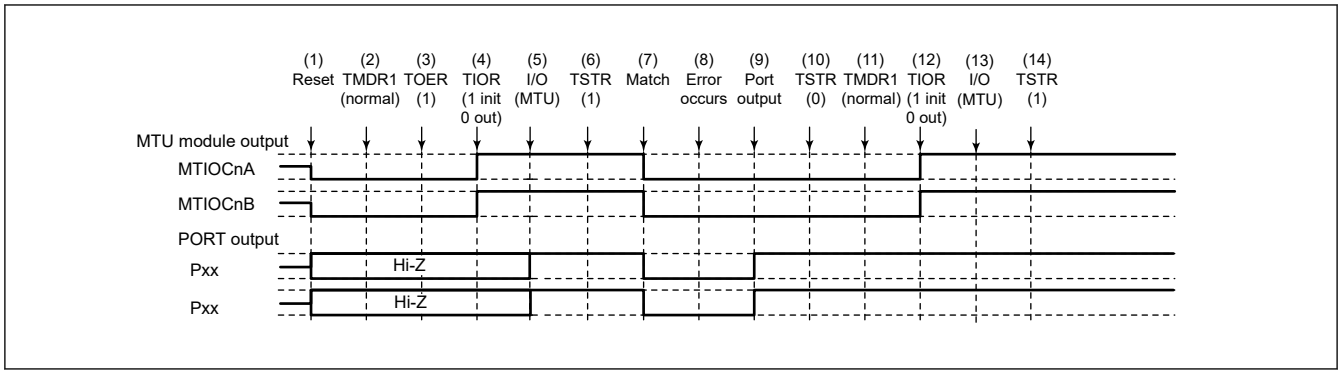

Figure 18.149 Error occurrence in normal mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) After a reset, the TMDR1 setting is for normal mode.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.

(4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register.

(11) This step is not necessary when restarting in normal mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.2 Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 18.150 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

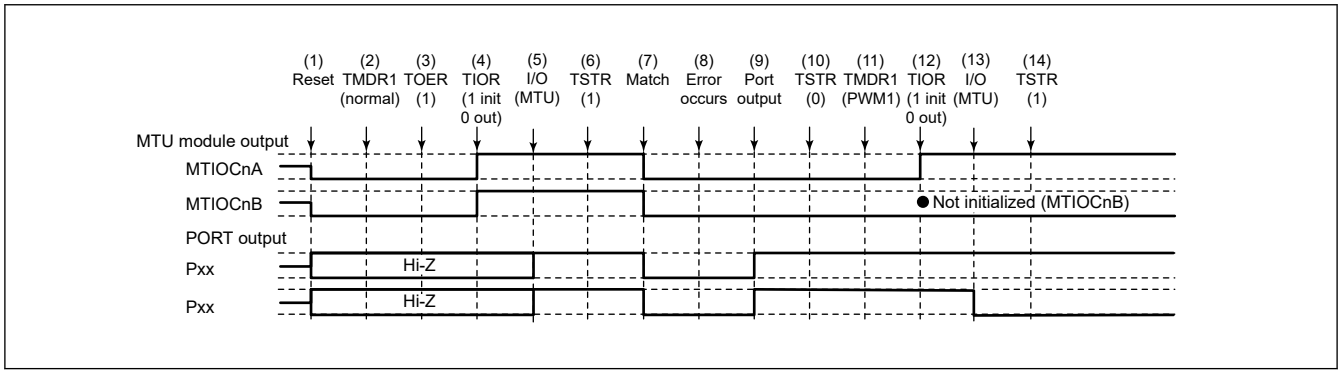

Figure 18.150 Error occurrence in normal mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 18.149.

(11) Set PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.3 Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 18.151 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

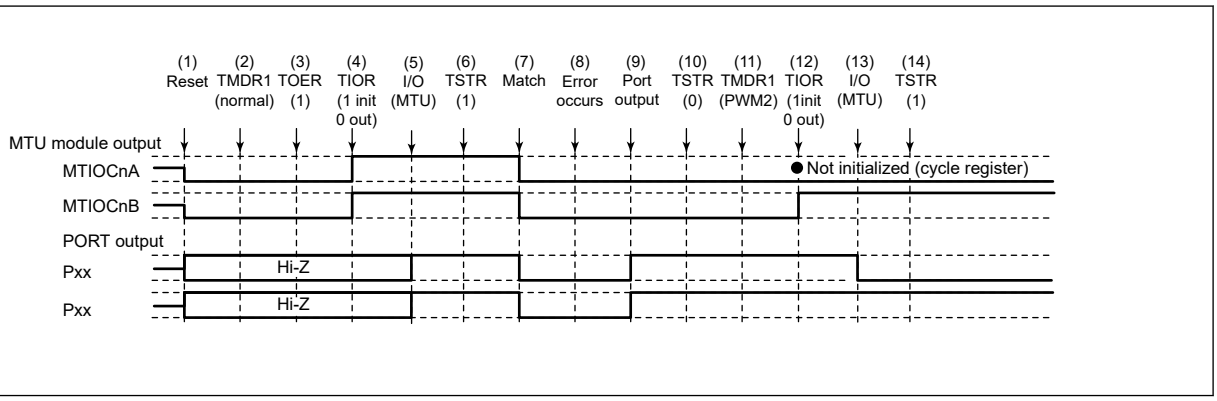

Figure 18.151 Error occurrence in normal mode, recovery in PWM mode 2

(1) to (10) are the same as in Figure 18.149.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore the TOERA register setting is not necessary.

18.8.3.4 Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 18.152 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

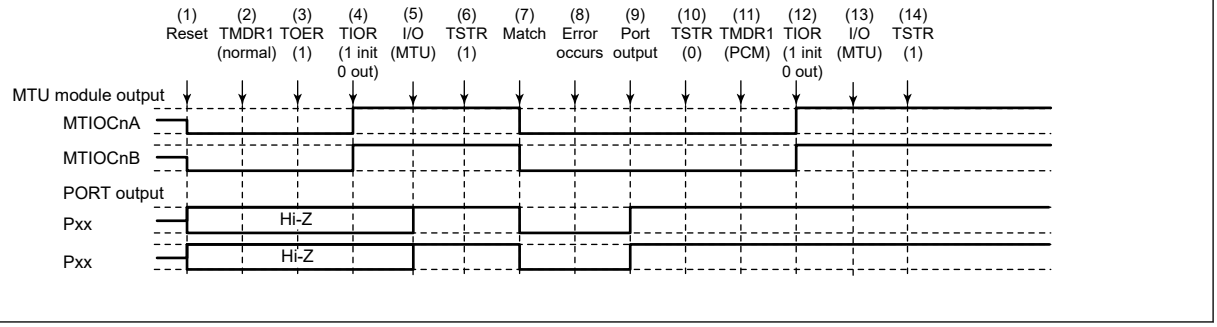

Figure 18.152 Error occurrence in normal mode, recovery in phase counting mode

(1) to (10) are the same as in Figure 18.149.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

18.8.3.5 Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 18.153 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

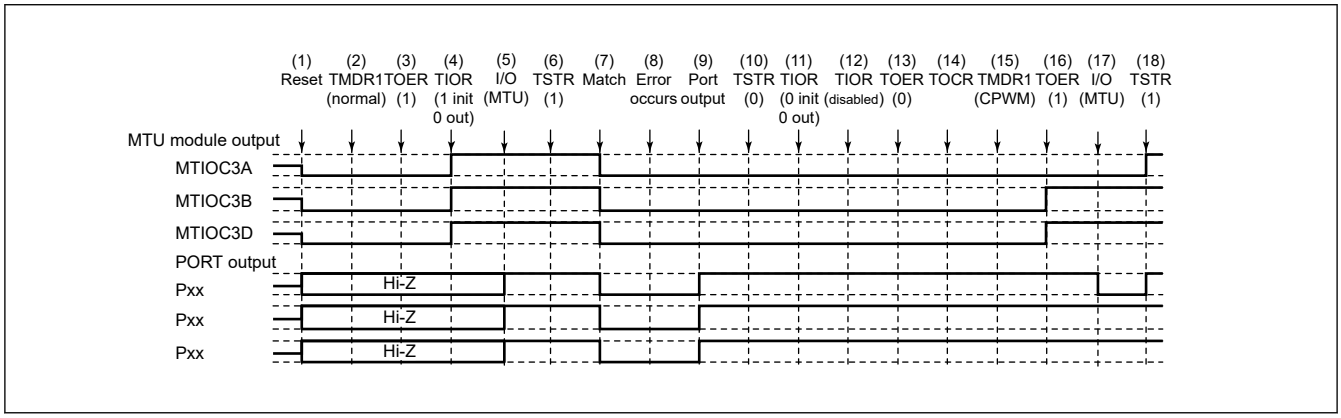

Figure 18.153 Error occurrence in normal mode, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 18.149.

(11) Initialize the normal mode waveform generation block with the TIOR register.

(12) Disable operation of the normal mode waveform generation block with the TIOR register.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(14) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(17) Set MTU output using the I/O port registers corresponding to the I/O ports.

(18) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.6 Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 18.154 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

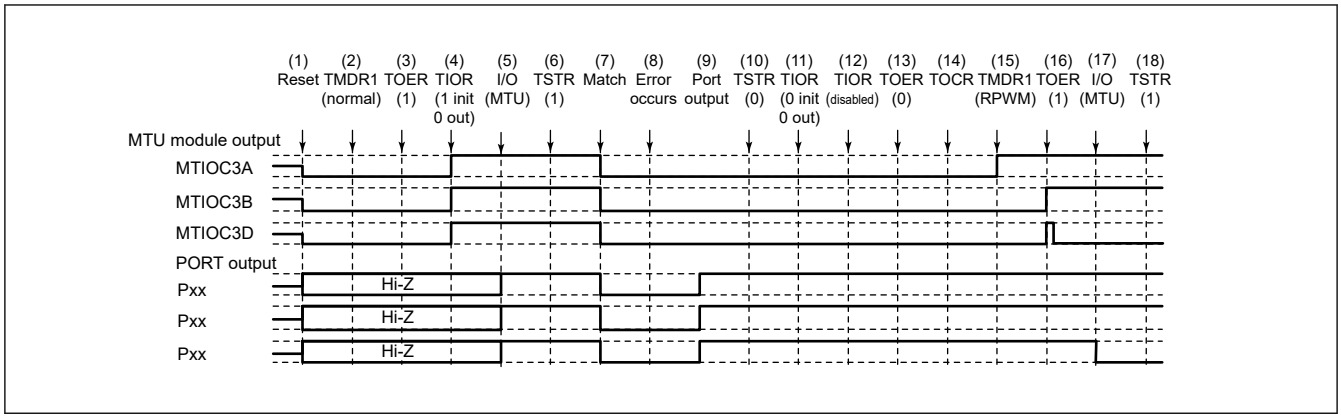

Figure 18.154 Error occurrence in normal mode, recovery in reset-synchronized PWM mode

(1) to (13) are the same as in Figure 18.153.

(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set reset-synchronized PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(17) Set MTU output using the I/O port registers corresponding to the I/O ports.

(18) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.7 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 18.155 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

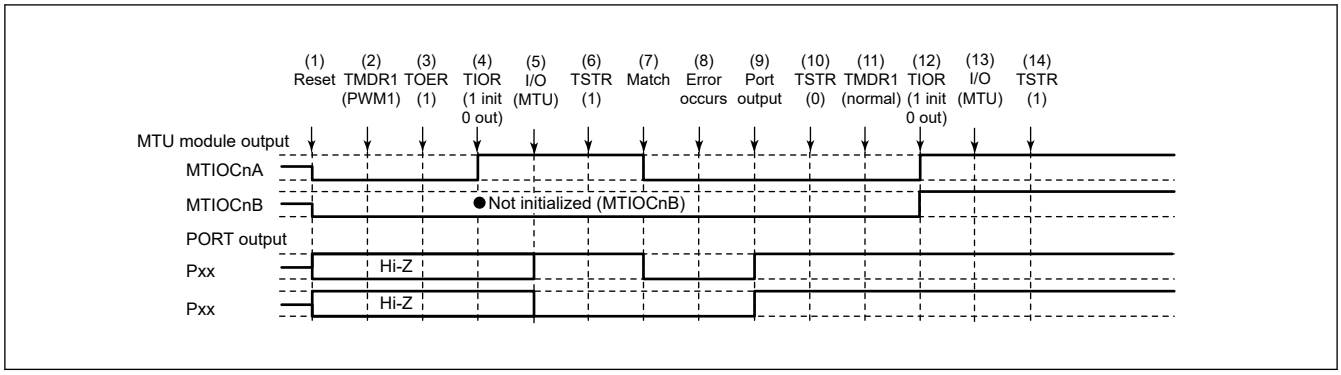

Figure 18.155 Error occurrence in PWM mode 1, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 1.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.

(4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register.

(11) Set normal mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.8 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 18.156 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

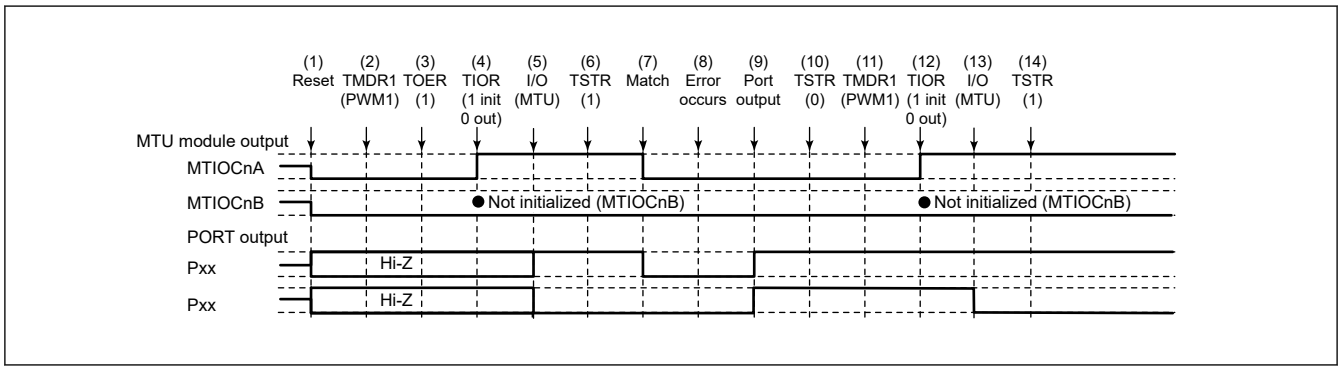

Figure 18.156 Error occurrence in PWM mode 1, recovery in PWM mode 1

(1) to (10) are the same as in Figure 18.155.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.9 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 18.157 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

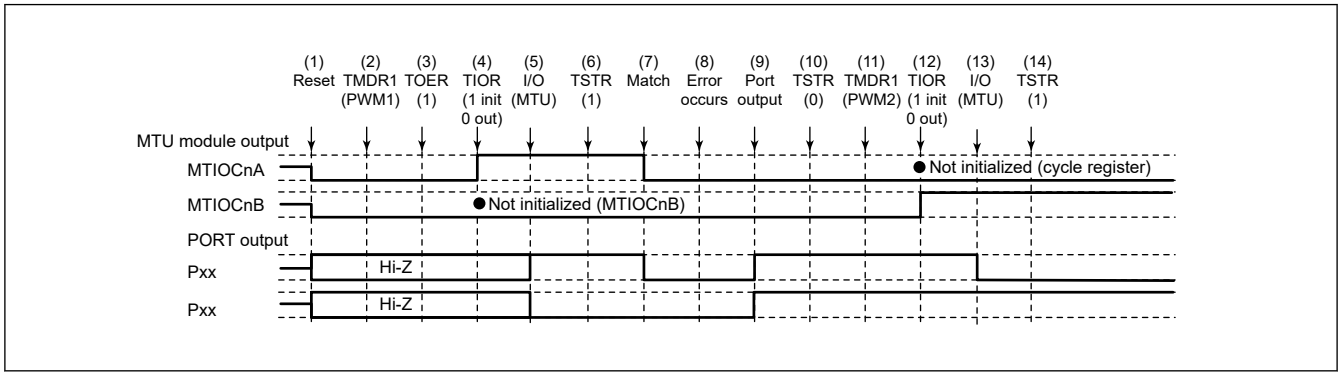

Figure 18.157 Error occurrence in PWM mode 1, recovery in PWM mode 2

(1) to (10) are the same as in Figure 18.155.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore the TOERA register setting is not necessary.

18.8.3.10 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 18.158 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

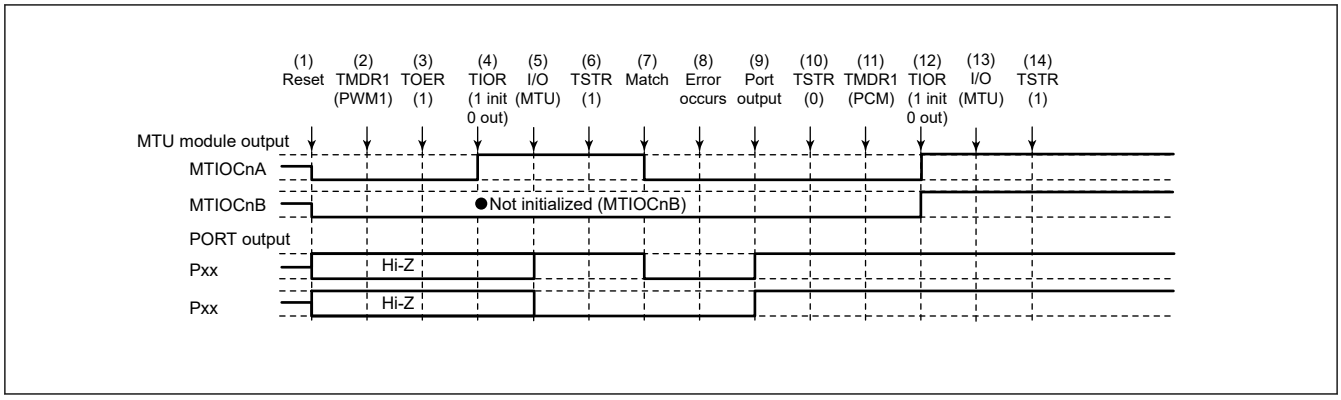

Figure 18.158 Error occurrence in PWM mode 1, recovery in phase counting mode

(1) to (10) are the same as in Figure 18.155.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

18.8.3.11 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 18.159 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

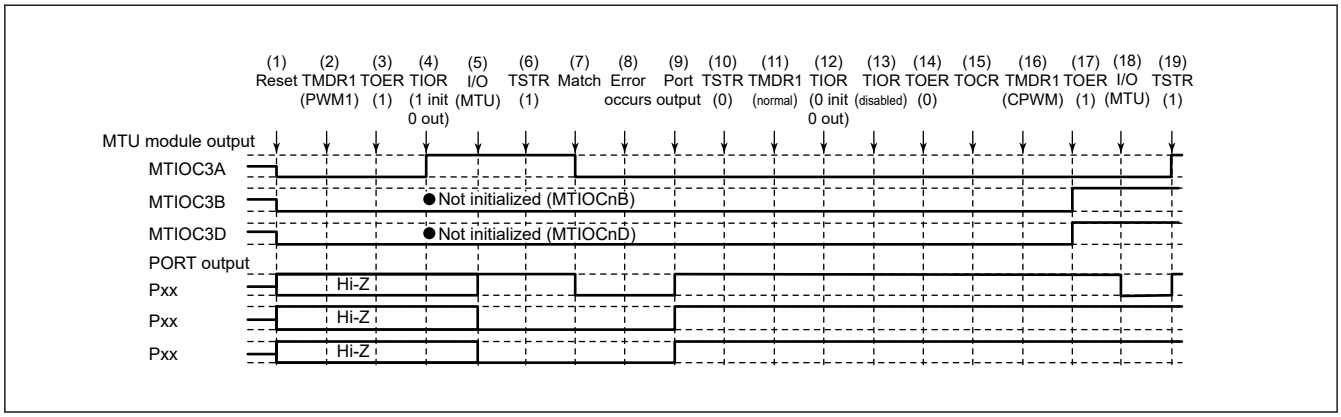

Figure 18.159 Error occurrence in PWM mode 1, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 18.155.

(11) Set normal mode to initialize the normal mode waveform generation block.

(12) Initialize the PWM mode 1 waveform generation block with the TIOR register.

(13) Disable operation of the PWM mode 1 waveform generation block with the TIOR register.

(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(15) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TSTRB).

(16) Set complementary PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(18) Set MTU output using the I/O port registers corresponding to the I/O ports.

(19) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.12 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 18.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

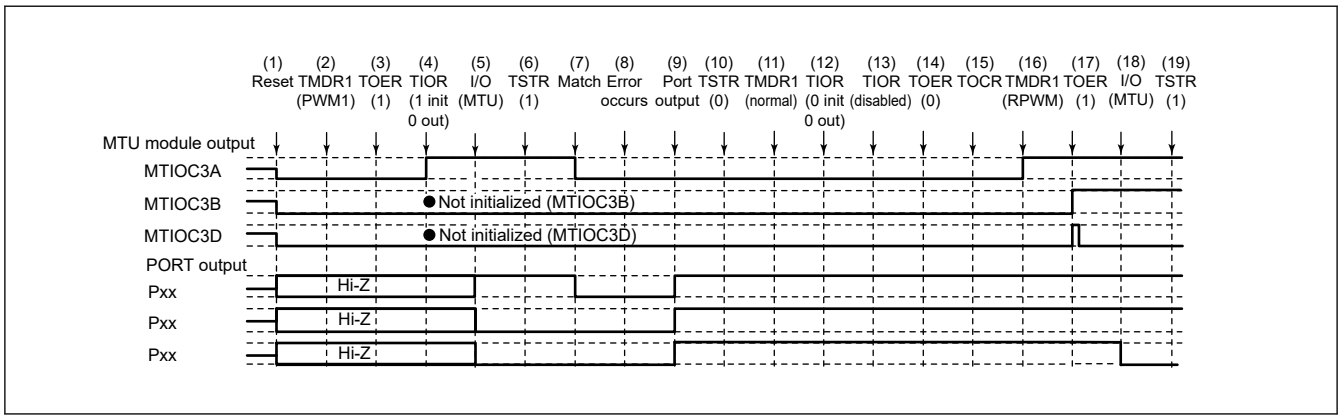

Figure 18.160 Error occurrence in PWM mode 1, recovery in reset-synchronized PWM mode

(1) to (14) are the same as in Figure 18.159.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(18) Set MTU output using the I/O port registers corresponding to the I/O ports.

(19) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.13 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 18.161 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

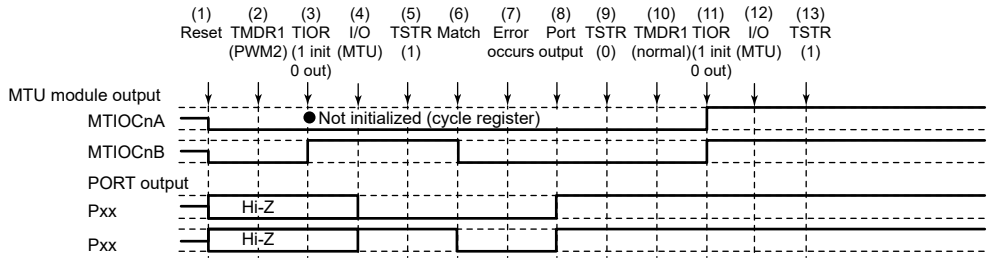

Figure 18.161 Error occurrence in PWM mode 2, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 2.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the cycle register pins are not initialized. In the example, MTIOCnA is the cycle register.)

(4) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(5) Start count operation by setting the TSTRA (TSTRB) register.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(9) Stop count operation by setting the TSTRA (TSTRB) register.

(10) Set normal mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.14 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 18.162 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

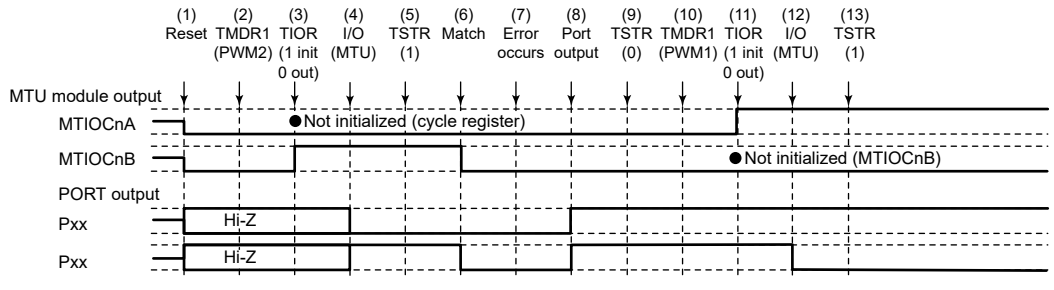

Figure 18.162 Error occurrence in PWM mode 2, recovery in PWM mode 1

(1) to (9) are the same as in Figure 18.161.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.15 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 18.163 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

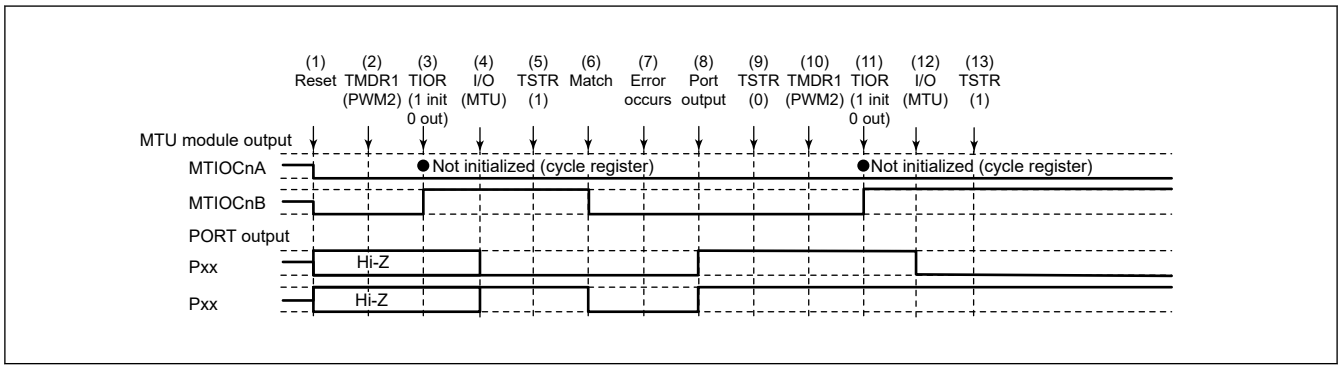

Figure 18.163 Error occurrence in PWM mode 2, recovery in PWM mode 2

(1) to (9) are the same as in Figure 18.161.

(10) This step is not necessary when restarting in PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

18.8.3.16 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 18.164 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

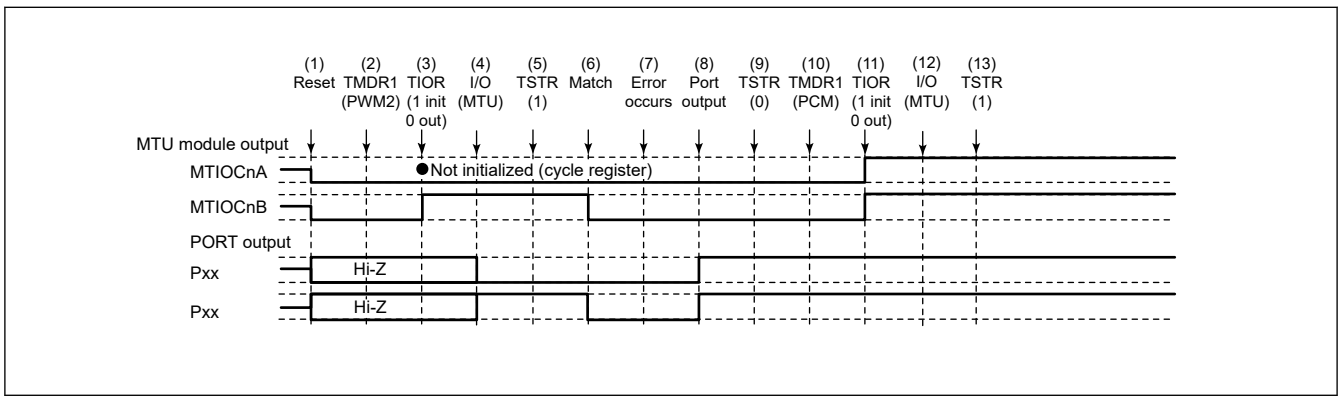

Figure 18.164 Error occurrence in PWM mode 2, recovery in phase counting mode

(1) to (9) are the same as in Figure 18.161.

(10) Set the phase counting mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

18.8.3.17 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 18.165 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

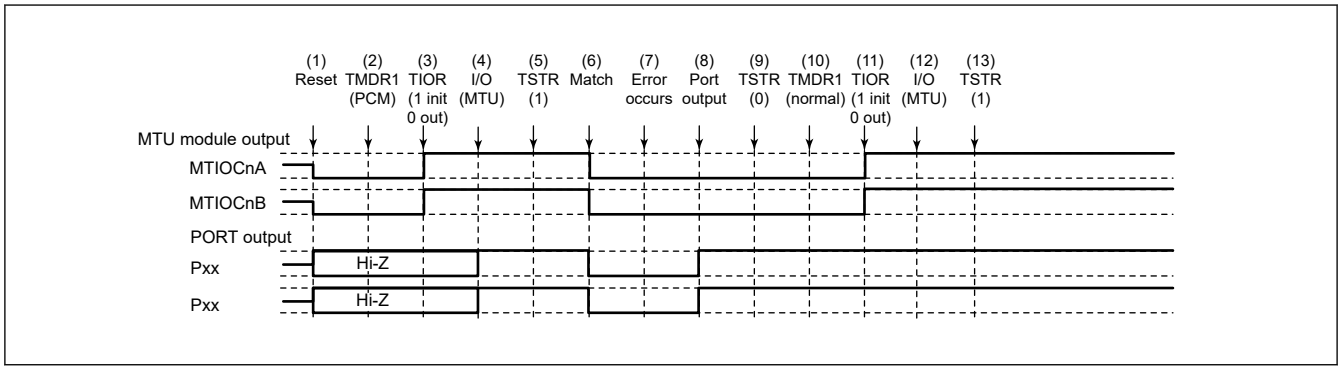

Figure 18.165 Error occurrence in phase counting mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set phase counting mode.

(3) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(4) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(5) Start count operation by setting the TSTRA (TSTRB) register.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(9) Stop count operation by setting the TSTRA (TSTRB) register.

(10) Set normal mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.18 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 18.166 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

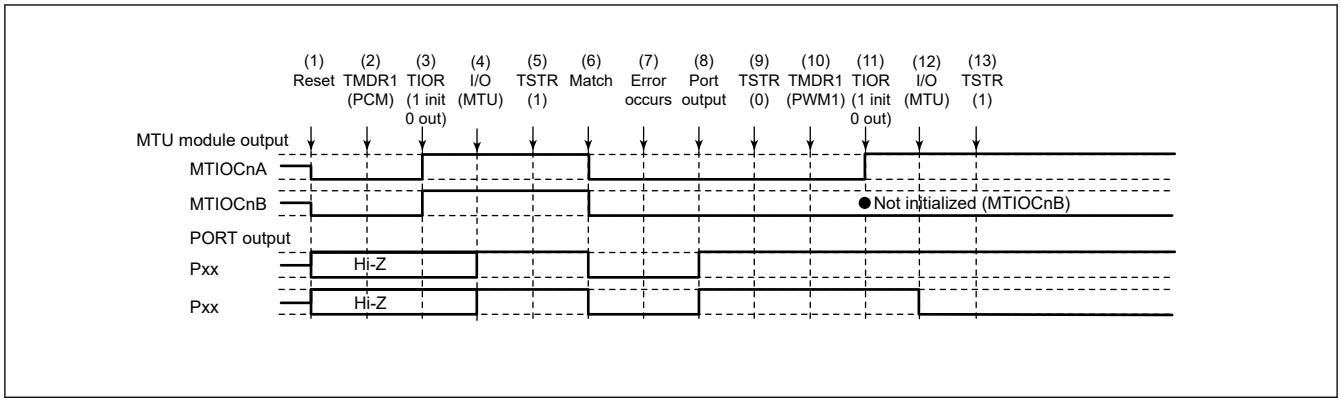

Figure 18.166 Error occurrence in phase counting mode, recovery in PWM mode 1

(1) to (9) are the same as in Figure 18.165.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.19 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 18.167 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

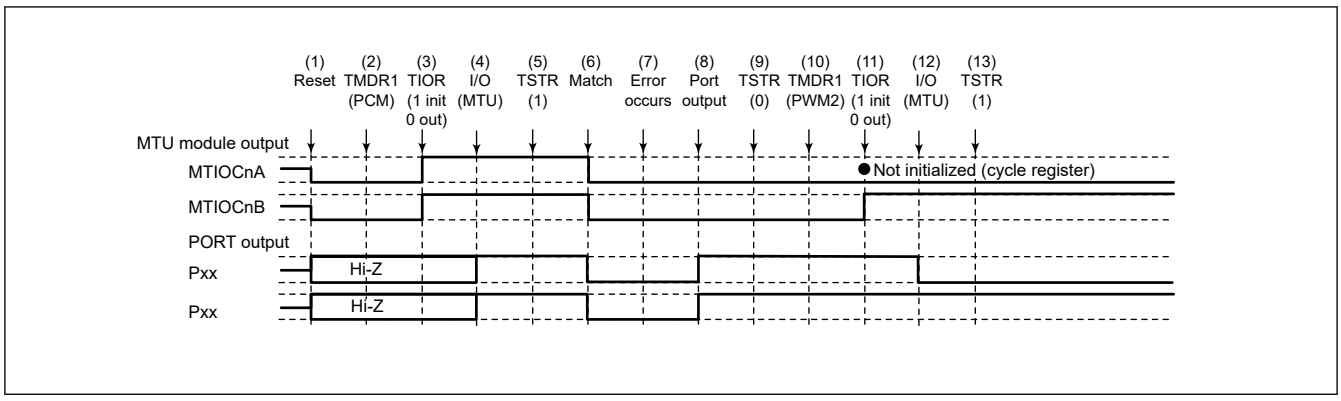

Figure 18.167 Error occurrence in phase counting mode, recovery in PWM mode 2

(1) to (9) are the same as in Figure 18.165.

(10) Set PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

18.8.3.20 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 18.168 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

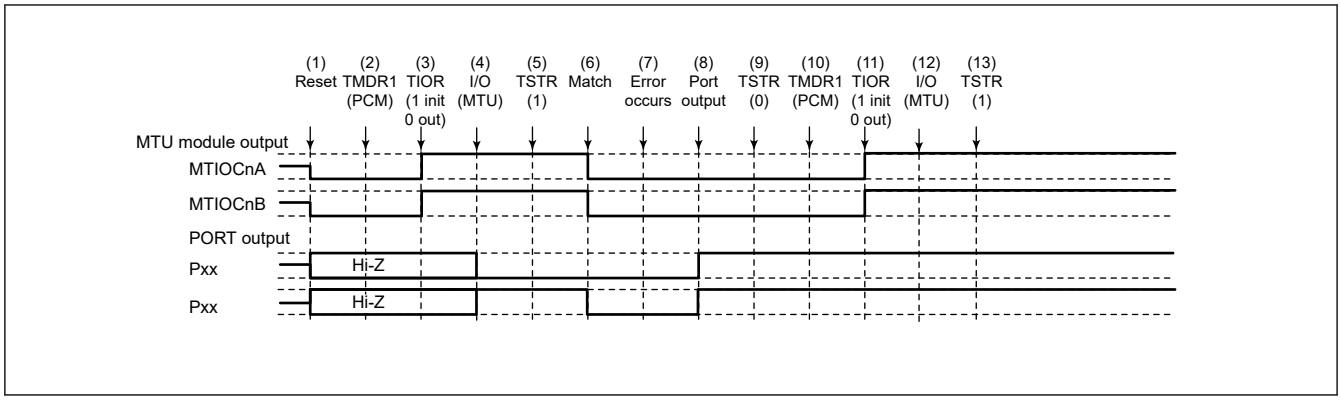

Figure 18.168 Error occurrence in phase counting mode, recovery in phase counting mode

(1) to (9) are the same as in Figure 18.165.

(10) This step is not necessary when restarting in phase counting mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

18.8.3.21 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 18.169 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

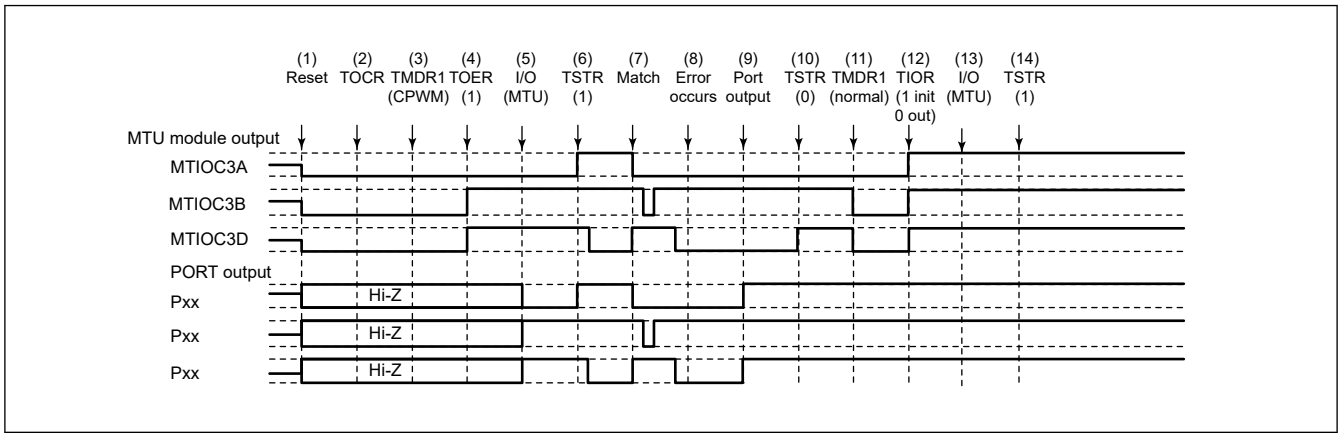

Figure 18.169 Error occurrence in complementary PWM mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set complementary PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) The complementary PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial complementary PWM output value).

(11) Set normal mode (MTU output goes low).

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.22 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 18.170 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

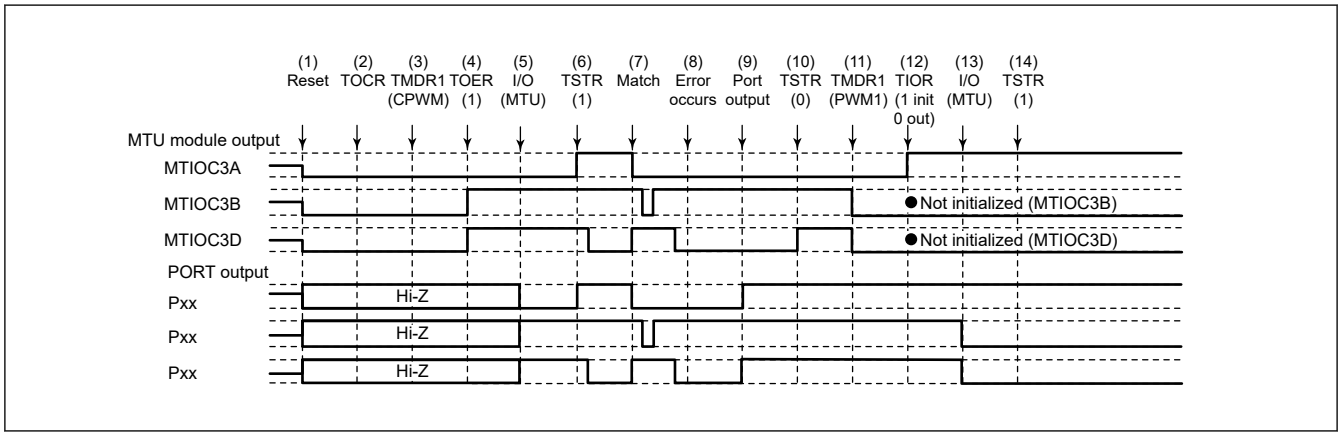

Figure 18.170 Error occurrence in complementary PWM mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 18.169.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.23 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 18.171 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the period and duty settings at the time of stopping the counter).

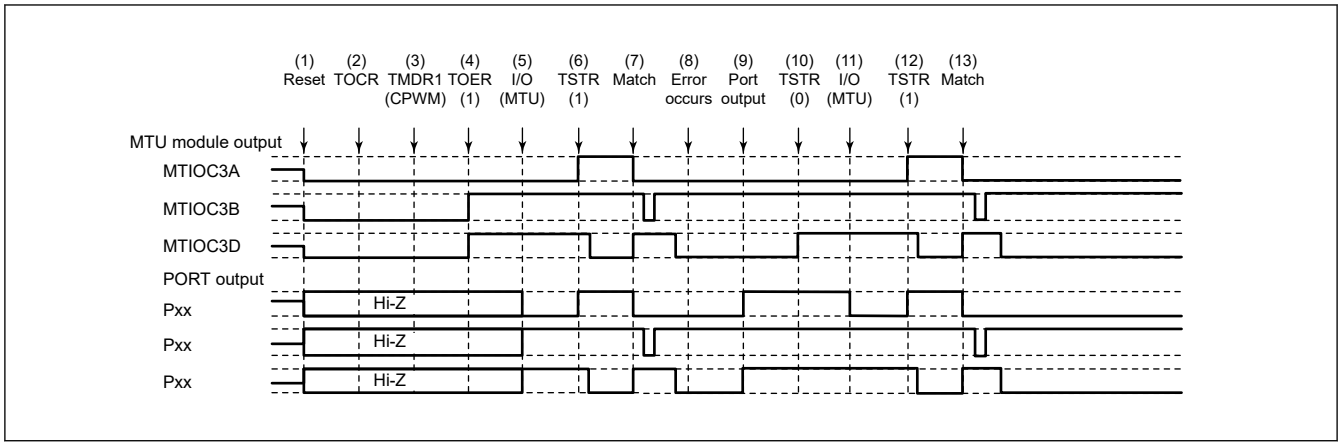

Figure 18.171 Error occurrence in complementary PWM mode, recovery in complementary PWM mode (1)

(1) to (10) are the same as in Figure 18.169.

(11) Set MTU output using the I/O port registers corresponding to the I/O ports.

(12) Restart operation by setting the TSTRA (TSTRB) register.

(13) The complementary PWM waveform is output on compare match occurrence.

18.8.3.24 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 18.172 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new period and duty ratio settings).

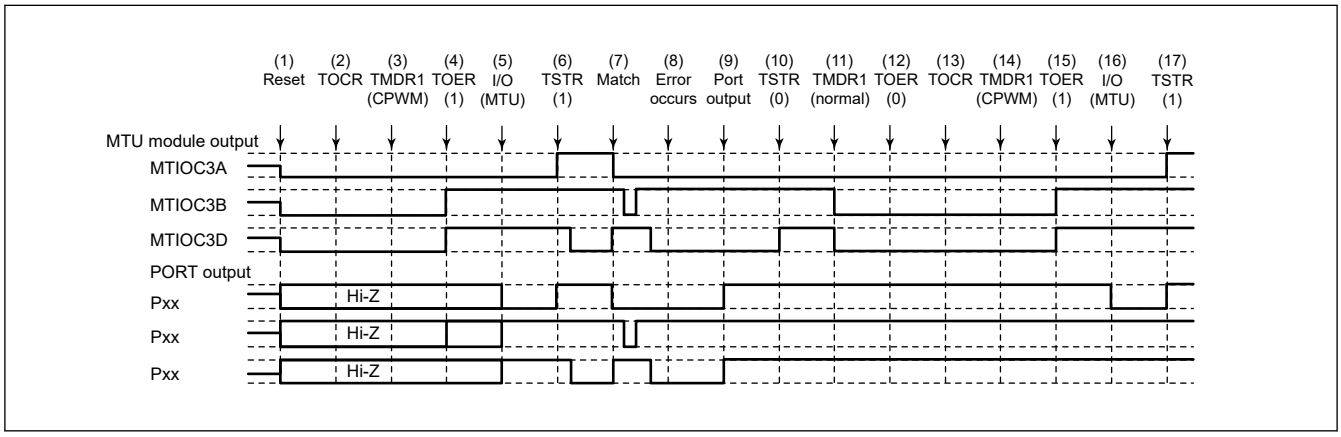

Figure 18.172 Error occurrence in complementary PWM mode, recovery in complementary PWM mode (2)

(1) to (10) are the same as in Figure 18.169.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(16) Set MTU output using the I/O port registers corresponding to the I/O ports.

(17) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.25 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 18.173 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

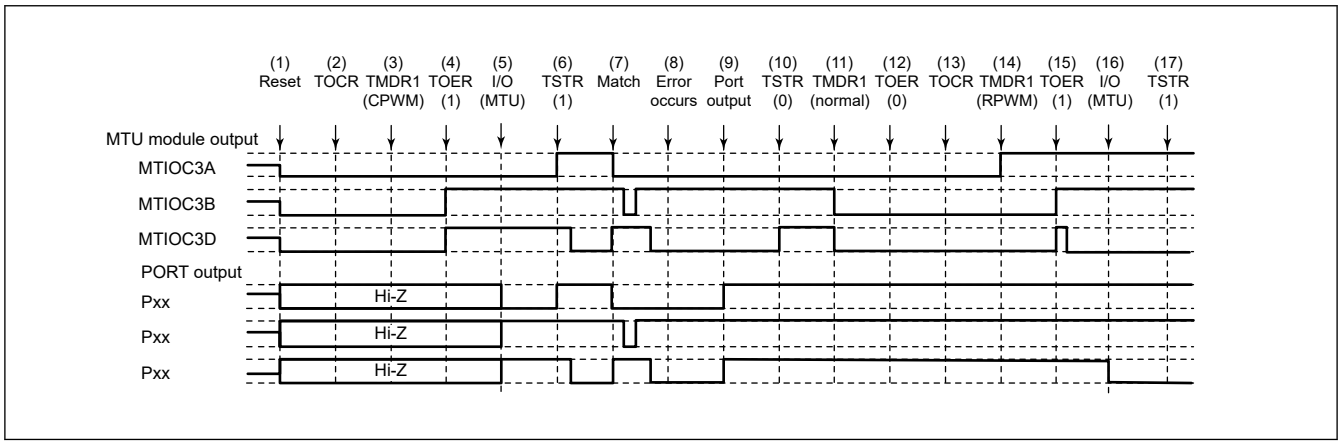

Figure 18.173 Error occurrence in complementary PWM mode, recovery in reset-synchronized PWM mode

(1) to (10) are the same as in Figure 18.169.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(16) Set MTU output using the I/O port registers corresponding to the I/O ports.

(17) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.26 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 18.174 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

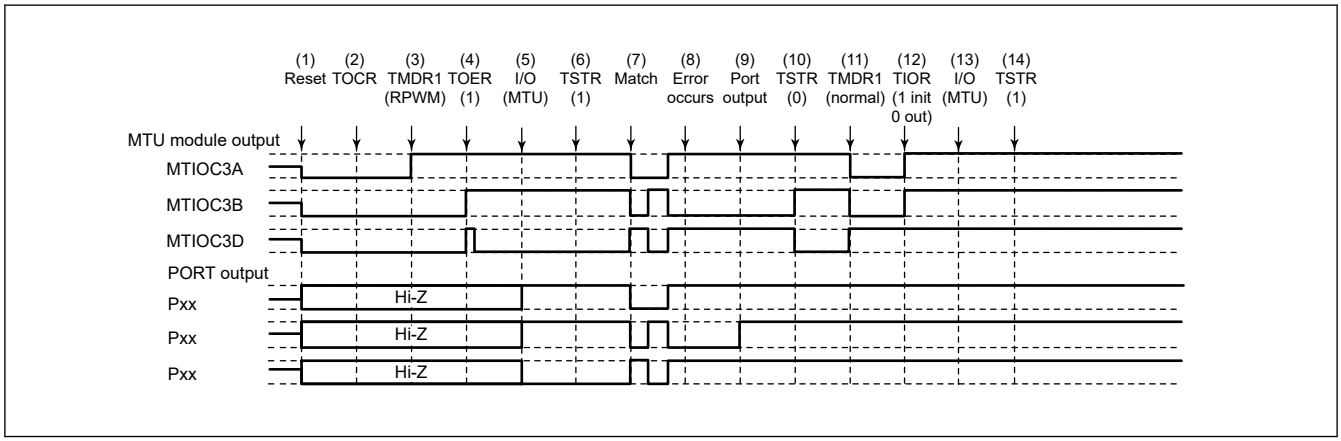

Figure 18.174 Error occurrence in reset-synchronized PWM mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set reset-synchronized PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) The reset-synchronized PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial reset-synchronized PWM output value.)

(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.27 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 18.175 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

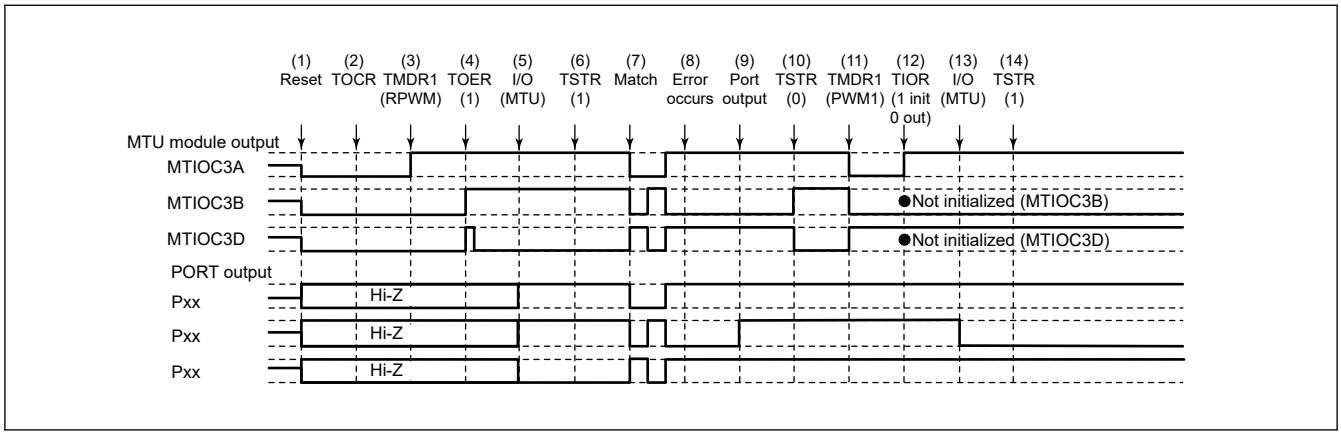

Figure 18.175 Error occurrence in reset-synchronized PWM mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 18.174.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.28 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 18.176 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

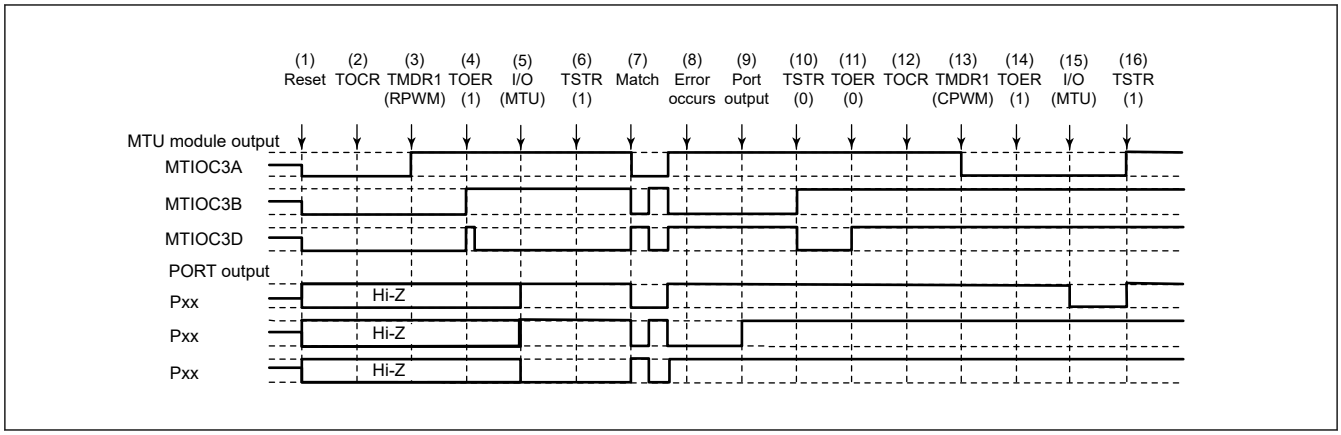

Figure 18.176 Error occurrence in reset-synchronized PWM mode, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 18.174.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(12) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(15) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(16) Restart operation by setting the TSTRA (TSTRB) register.

18.8.3.29 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 18.177 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

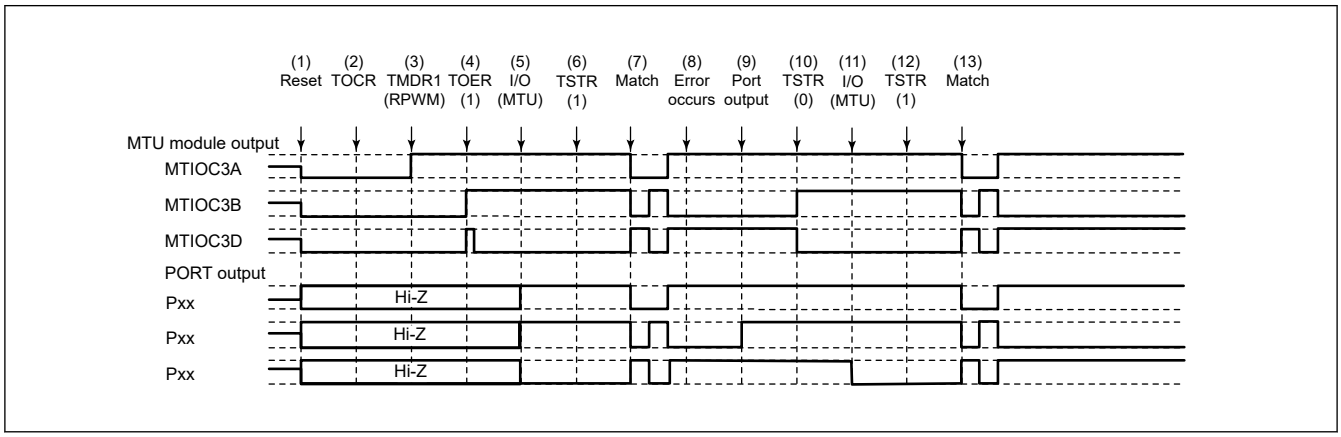

Figure 18.177 Error occurrence in reset-synchronized PWM mode, recovery in reset-synchronized PWM mode

(1) to (10) are the same as in Figure 18.174.

(11) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(12) Restart operation by setting the TSTRA (TSTRB) register.

(13) The reset-synchronized PWM waveform is output on compare match occurrence.

18.9 Operations Linked by the ELC

18.9.1 Event Signal Output to the ELC

The MTU is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).

The MTU outputs the event signal regardless of the setting of the corresponding interrupt request enable bit.

18.9.2 MTU Operations in Response to Receiving Event Signals from the ELC

The MTU can perform the following operations in response to the event set in advance in the ELC_SSEL0 register of the event link controller (ELC).

(1) Start Counting Operation

Select "counting is started" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the CSTn bit in the TSTRA register shown in Table 18.77 is set to 1, and the MTU counter starts.

However, when the specified event is generated while the CSTn bit in the TSTRA register has already been set to 1, the event has no effect. Table 18.77 lists the TSTRA register bits used for each channel.

Table 18.77 Counter start bit set by the ELC

Channel no.	Counter start bit
MTU0	TSTRA.CST0 bit
MTU3	TSTRA.CST3 bit
MTU4	TSTRA.CST4 bit

(2) Input Capture Operation

Select "input capture" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the value of the TCNT register is captured in the TGR register. When using input capture in response to an event, the corresponding bit of the TIOR register in the MTU should be set for input capture and the CSTn bit of TSTRA register should be set to 1 to start counting by the counter.

In this case, the TIOCnA pin (input capture pin) input has no effect.

Table 18.78 lists the timer general register and I/O control bit used for each channel in input capture operations in response to the ELC.

Table 18.78 Timer general register and I/O control bit used in the Input capture operation

Channel no.	Timer general register	I/O control bit
MTU0	MTU0.TGRA	MTU0.TIORH.IOA[3:0] bits
MTU3	MTU3.TGRA	MTU3.TIORH.IOA[3:0] bits
MTU4	MTU4.TGRA	MTU4.TIORH.IOA[3:0] bits

(3) Restart Counting (Clear Counter) Operation

Select "counting is restarted" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the TCNT register is cleared. If the corresponding CSTn bit in the TSTRA register is set to 1, counting continues. For the CSTn bits in the TSTRA register, see Table 18.77.

18.9.3 Usage Notes on MTU Operation by Event Signal Reception from the ELC

The following notes on usage apply when the MTU is used in event link operation.

(1) Start Counting

If the event specified in the ELC_SSEL0 register occurs during a cycle of writing to a CSTn bit in the TSTRA register, writing to the CSTn bit in the TSTRA register does not proceed because setting of the bit to 1 due to the event takes priority.

(2) Restart Counting (Clear Counter)

If the event specified in the ELC_SSEL0 register occurs during a cycle of writing to the TCNT counter, writing to the TCNT counter does not proceed because clearing of the counter due to the event takes priority.

In addition, for MTU3 and MTU4 in complementary PWM mode, do not use the counter restarting by the ELC.

19. Port Output Enable 3 (POE3)

19.1 Overview

The LSI incorporates a port output enable 3 (POE3) module that can be used to place output pins for the MTU3 in the high-impedance state under various conditions. Every output signal is put in the high-impedance state when the output is disabled.

Table 19.1 lists the specifications of the POE3 and Figure 19.1 shows a block diagram of the POE3.

Table 19.1 POE3 specifications

Parameter	Description
Target pins to be placed in the high-impedance state	• MTU3 output pins MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D) MTU3 pins (MTIOC3B, MTIOC3D) MTU4 pins (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) MTU6 pins (MTIOC6B, MTIOC6D) MTU7 pins (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D)
Conditions for the high-impedance state	• Setting pins as inputs: setting the POE0#, POE4#, POE8#, POE10#, and POE11# pins as inputs (falling edge or low-level sampling) • Short-circuits between output pins: a match (short circuit) between the output signal levels at the active level over one or more cycle on the following combination of pins: – MTU complementary PWM output pins 1. MTIOC3B and MTIOC3D 2. MTIOC4A and MTIOC4C 3. MTIOC4B and MTIOC4D 4. MTIOC6B and MTIOC6D 5. MTIOC7A and MTIOC7C 6. MTIOC7B and MTIOC7D • SPOER register setting being made • Detection that the clock generation circuit had stopped oscillating or the oscillation is abnormal (CLMA0 to CLMA4: PLL0 to PLL4, CLMA6: main clock) • DSMIF error interrupt
Function	• Each of the POE0#, POE4#, POE8#, POE10#, and POE11# input pins can be set for falling edge, PCLKH/8 × 16, PCLKH/16 × 16, or PCLKH/128 × 16 low-level sampling. • The outputs of the target pins can be in the high-impedance state by falling-edge or low-level sampling of the POE0#, POE4#, POE8#, POE10#, or POE11# pin. • The outputs of the target pins can be in the high-impedance state when oscillation stop is detected by the oscillation stop detection function of the clock generator. • The outputs of the target pins can be in the high-impedance state when DSMIF error occurs. • The MTU complementary PWM outputs can be in the high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more. • The outputs of the target pins can be in the high-impedance state by modifying the settings of the POE3 registers. • Interrupts can be generated by input-level sampling or output-level comparison results.

The POE3 has input-level detection circuits, pin selection circuits, output-level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in Figure 19.1.

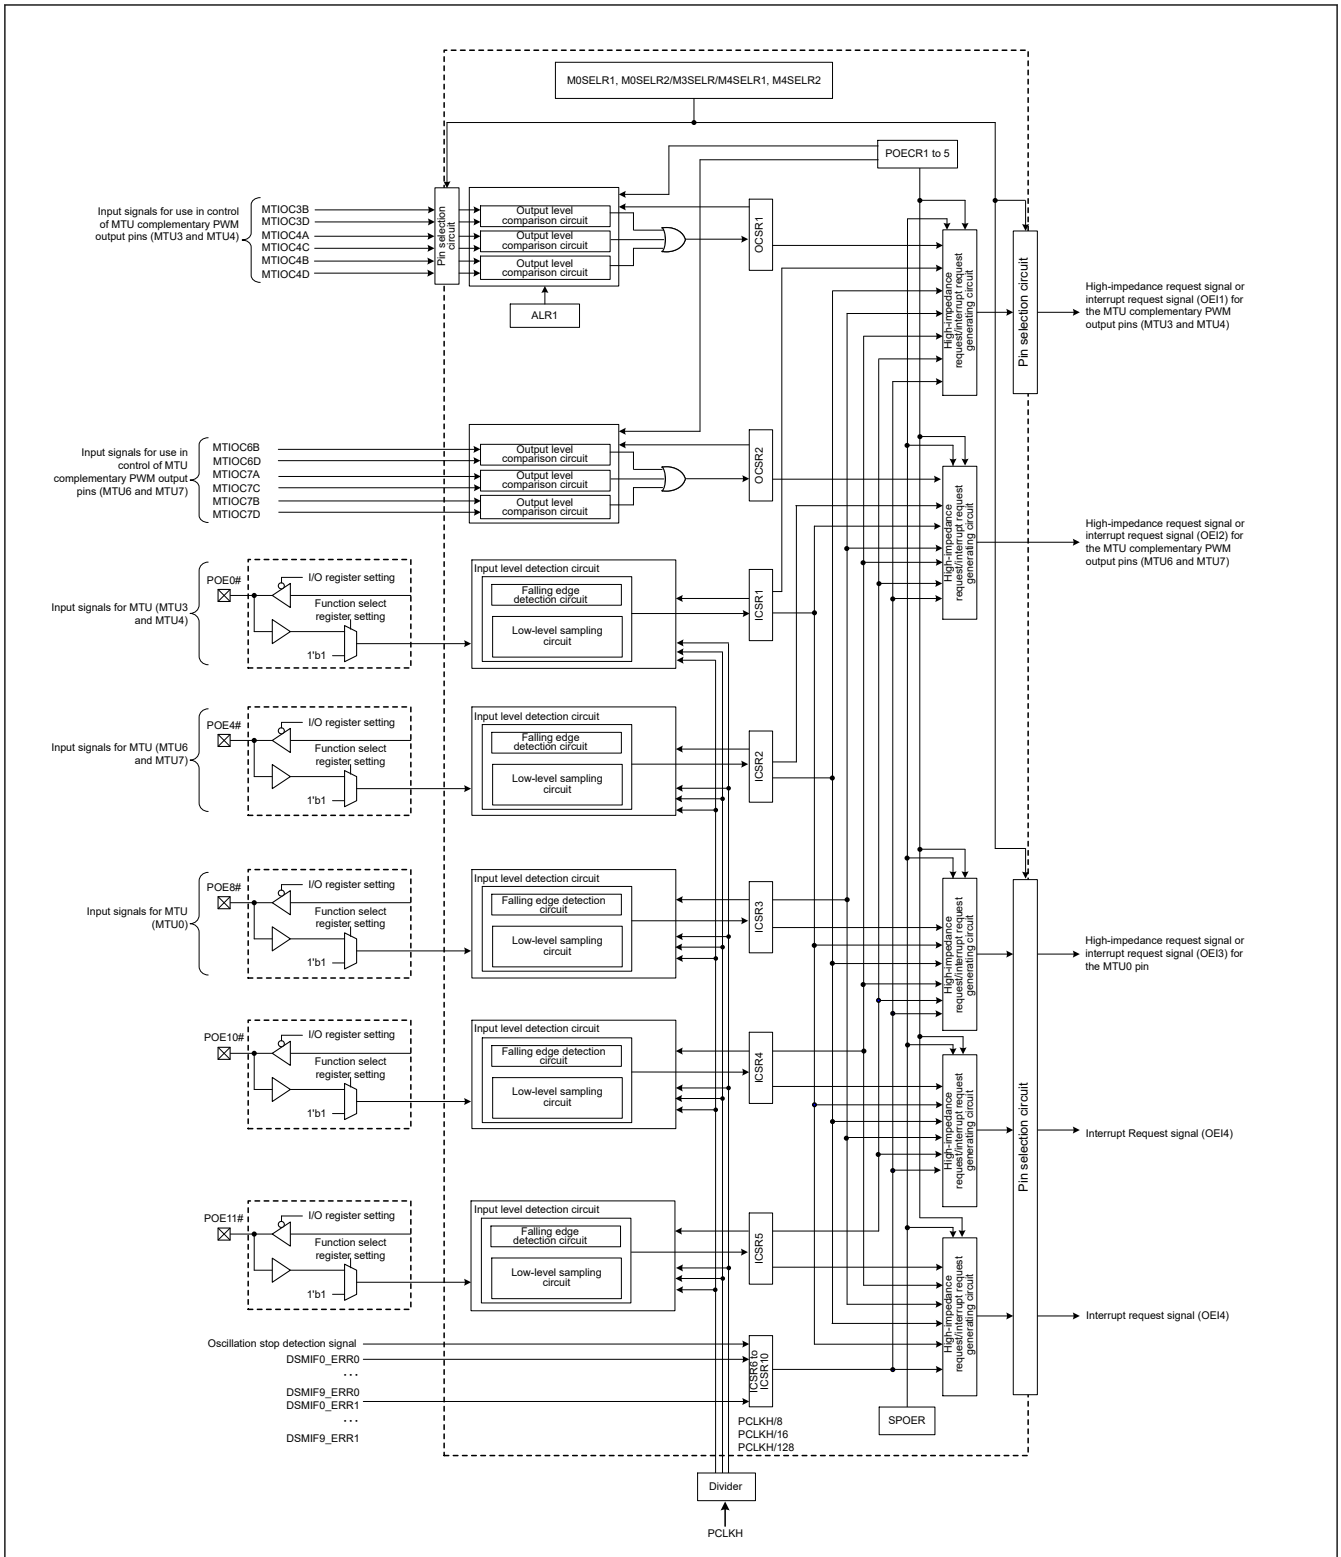

Figure 19.1 POE3 block diagram

Table 19.2 shows I/O pins to be used by the POE3.

Table 19.2 POE3 I/O pins

Pin name	I/O	Description
POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state.
POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state.
POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output.
POE10#	Input	In accord with register settings, this pin is capable of placing the any target pins in high-impedance state.
POE11#	Input	In accord with register settings, this pin is capable of placing the any target pins in high-impedance state.

Table 19.3 shows output-level comparisons with pin combinations.

Table 19.3 Pin combinations

Pin combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the peripheral clock (PCLKH). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*2 for one or more cycles of the peripheral clock (PCLKH). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	

Note 1. The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.

Note 2. The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.

19.2 Register Descriptions

The POE3 registers are initialized by a reset.

19.2.1 ICSR1 : Input Level Control/Status Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE0F	—	—	—	PIE1	—	—	—	—	—	—	POE0M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE0M[1:0]	POE0 Mode Select 0 0: Accepts a request on the falling edge of POE0# pin input 0 1: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1

Bit	Symbol	Function	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE1	Port Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
12	POE0F	POE0 Flag 0: Indicates that a high-impedance request has not been input to the POE0# pin 1: Indicates that a high-impedance request has been input to the POE0# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR1 register selects the input mode for the POE0# pin, controls the enable/disable of interrupts, and indicates status.

POE0M[1:0] bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when the POE0F flag in ICSR1 is set to 1.

POE0F flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by the POE0M[1:0] bits occurs at the POE0# pin

[Clearing condition]

- By writing 0 to the POE0F flag after reading POE0F = 1

19.2.2 ICSR2 : Input Level Control/Status Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE4F	—	—	—	PIE2	—	—	—	—	—	—	POE4M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE4M[1:0]	POE4 Mode Select 0 0: Accepts a request on the falling edge of POE4# pin input 0 1: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE2	Port Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
12	POE4F	POE4 Flag 0: Indicates that a high-impedance request has not been input to the POE4# pin 1: Indicates that a high-impedance request has been input to the POE4# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR2 register selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

POE4M[1:0] bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.

[Setting condition]

- When the input set by the POE4M[1:0] bits occurs at the POE4# pin

[Clearing condition]

- By writing 0 to the POE4F flag after reading POE4F = 1

19.2.3 ICSR3 : Input Level Control/Status Register 3

Base address: POE3 = 0x9001_8000

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE8F	—	—	POE8E	PIE3	—	—	—	—	—	—	POE8M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE8M[1:0]	POE8 Mode Select 0 0: Accepts a request on the falling edge of POE8# pin input 0 1: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE3	Port Interrupt Enable 3 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE8E	POE8 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE8F	POE8 Flag 0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR3 register selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

POE8M[1:0] bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F flag in ICSR3 is set to 1.

POE8E bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE8F flag is set to 1.

POE8F flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by the POE8M[1:0] bits occurs at the POE8# pin

[Clearing condition]

- By writing 0 to the POE8F flag after reading POE8F = 1

19.2.4 ICSR4 : Input Level Control/Status Register 4

Base address: POE3 = 0x9001_8000

Offset address: 0x16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE10F	—	—	POE10E	PIE4	—	—	—	—	—	—	POE10M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE10M[1:0]	POE10 Mode Select 0 0: Accepts a request on the falling edge of POE10# pin input 0 1: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE4	Port Interrupt Enable 4 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE10E	POE10 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE10F	POE10 Flag 0: Indicates that a high-impedance request has not been input to the POE10# pin 1: Indicates that a high-impedance request has been input to the POE10# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR4 register selects the input mode for the POE10# pin, controls the enable/disable of interrupts, and indicates status.

POE10M[1:0] bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F flag in ICSR4 is set to 1.

POE10E bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE10F flag is set to 1.

POE10F flag (POE10 Flag)

This flag indicates that a high-impedance request has been input to the POE10# pin.

[Setting condition]

- When the input set by the POE10M[1:0] bits occurs at the POE10# pin

[Clearing condition]

- By writing 0 to the POE10F flag after reading POE10F = 1

19.2.5 ICSR5 : Input Level Control/Status Register 5

Base address: POE3 = 0x9001_8000

Offset address: 0x18

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE11F	—	—	POE11E	PIE5	—	—	—	—	—	—	POE11M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE11M[1:0]	POE11 Mode Select 0 0: Accepts a request on the falling edge of POE11# pin input 0 1: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE5	Port Interrupt Enable 5 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE11E	POE11 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE11F	POE11 Flag 0: Indicates that a high-impedance request has not been input to the POE11# pin 1: Indicates that a high-impedance request has been input to the POE11# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: For the ICSR5 register, set the values the same as those in the ICSR4 register.
Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR5 register selects the pin input mode of the POE11#, controls the enable/disable of interrupts, and indicates status.

POE11M[1:0] bits (POE11 Mode Select)

These bits select the input mode of the POE11# pin.

PIE5 bit (Port Interrupt Enable 5)

This bit enables or disables interrupt requests when the POE11F flag in ICSR5 is set to 1.

POE11E bit (POE11 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE11F flag is set to 1. The interrupt output is multiplexed with OEI4.

POE11F flag (POE11 Flag)

This flag indicates that a high-impedance request has been input to the POE11# pin.

[Setting condition]

- When the input set by the POE11M[1:0] bits occurs at the POE11# pin

[Clearing condition]

- By writing 0 to the POE11F flag after reading POE11F = 1

19.2.6 ICSR6 : Input Level Control/Status Register 6

Base address: POE3 = 0x9001_8000

Offset address: 0x1C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OSTSTF	—	—	OSTSTE	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	—	These bits are read as 0. The write value should be 0.	R/W
9	OSTSTE	Oscillation Stop High-Impedance Enable 0: Does not place the MTU complementary PWM output pins and MTU0 pins in high-impedance state 1: Places the MTU complementary PWM output pins and MTU0 pins in high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	OSTSTF	Oscillation Stop High-Impedance Flag 0: Indicates that a high-impedance request or oscillation abnormality has not been generated. 1: Indicates that a high-impedance request by oscillation stop or oscillation abnormality has been generated.	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR6 register controls the high-impedance for stopped oscillation or oscillation abnormality and indicates the status.

OSTSTE bit (Oscillation Stop High-Impedance Enable)

This bit enables or disables the MTU complementary PWM output pins and MTU0 pins to be placed in the high-impedance state when stopped oscillation or oscillation abnormality of the PLL is detected.

OSTSTF flag (Oscillation Stop High-Impedance Flag)

This flag indicates that a stopped oscillation high-impedance request has been generated.

When stopped oscillation is detected, this flag is set to 1. When clearing this flag, write 0 while the detection signal for stopped oscillation or oscillation abnormality of the PLL is negated. Writing 0 to this flag while the detection signal for

stopped oscillation or oscillation abnormality is asserted does not clear this flag to 0. After clearing this flag, confirm that the flag has actually been modified to 0.

[Setting condition]

- When stopped oscillation is detected

[Clearing condition]

- By writing 0 to the OSTSTF flag after reading OSTSTF = 1

19.2.7 ICSR7 : Input Level Control/Status Register 7

Base address: POE3 = 0x9001_8000

Offset address: 0x1E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9ERR0ST	D8ERR0ST	D7ERR0ST	D6ERR0ST	D5ERR0ST	D4ERR0ST	D3ERR0ST	D2ERR0ST	D1ERR0ST	D0ERR0ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0ERR0ST	DSMIF0 Error 0 Status 0: Indicates that DSMIF0 error 0 has not been generated 1: Indicates that DSMIF0 error 0 has been generated	R
1	D1ERR0ST	DSMIF1 Error 0 Status 0: Indicates that DSMIF1 error 0 has not been generated 1: Indicates that DSMIF1 error 0 has been generated	R
2	D2ERR0ST	DSMIF2 Error 0 Status 0: Indicates that DSMIF2 error 0 has not been generated 1: Indicates that DSMIF2 error 0 has been generated	R
3	D3ERR0ST	DSMIF3 Error 0 Status 0: Indicates that DSMIF3 error 0 has not been generated 1: Indicates that DSMIF3 error 0 has been generated	R
4	D4ERR0ST	DSMIF4 Error 0 Status 0: Indicates that DSMIF4 error 0 has not been generated 1: Indicates that DSMIF4 error 0 has been generated	R
5	D5ERR0ST	DSMIF5 Error 0 Status 0: Indicates that DSMIF5 error 0 has not been generated 1: Indicates that DSMIF5 error 0 has been generated	R
6	D6ERR0ST	DSMIF6 Error 0 Status 0: Indicates that DSMIF6 error 0 has not been generated 1: Indicates that DSMIF6 error 0 has been generated	R
7	D7ERR0ST	DSMIF7 Error 0 Status 0: Indicates that DSMIF7 error 0 has not been generated 1: Indicates that DSMIF7 error 0 has been generated	R
8	D8ERR0ST	DSMIF8 Error 0 Status 0: Indicates that DSMIF8 error 0 has not been generated 1: Indicates that DSMIF8 error 0 has been generated	R
9	D9ERR0ST	DSMIF9 Error 0 Status 0: Indicates that DSMIF9 error 0 has not been generated 1: Indicates that DSMIF9 error 0 has been generated	R
15:10	—	These bits are read as 0.	R

The ICSR7 register indicates DSMIF error 0 status.

D0ERR0ST bit (DSMIF0 Error 0 Status)

This bit indicates that a DSMIF0 error 0 interrupt request has been generated.

When DSMIF0 error 0 is detected, this bit is set to 1.

D1ERR0ST bit (DSMIF1 Error 0 Status)

This bit indicates that a DSMIF1 error 0 interrupt request has been generated.

When DSMIF1 error 0 is detected, this bit is set to 1.

D2ERR0ST bit (DSMIF2 Error 0 Status)

This bit indicates that a DSMIF2 error 0 interrupt request has been generated.

When DSMIF2 error 0 is detected, this bit is set to 1.

D3ERR0ST bit (DSMIF3 Error 0 Status)

This bit indicates that a DSMIF3 error 0 interrupt request has been generated.

When DSMIF3 error 0 is detected, this bit is set to 1.

D4ERR0ST bit (DSMIF4 Error 0 Status)

This bit indicates that a DSMIF4 error 0 interrupt request has been generated.

When DSMIF4 error 0 is detected, this bit is set to 1.

D5ERR0ST bit (DSMIF5 Error 0 Status)

This bit indicates that a DSMIF5 error 0 interrupt request has been generated.

When DSMIF5 error 0 is detected, this bit is set to 1.

D6ERR0ST bit (DSMIF6 Error 0 Status)

This bit indicates that a DSMIF6 error 0 interrupt request has been generated.

When DSMIF6 error 0 is detected, this bit is set to 1.

D7ERR0ST bit (DSMIF7 Error 0 Status)

This bit indicates that a DSMIF7 error 0 interrupt request has been generated.

When DSMIF7 error 0 is detected, this bit is set to 1.

D8ERR0ST bit (DSMIF8 Error 0 Status)

This bit indicates that a DSMIF8 error 0 interrupt request has been generated.

When DSMIF8 error 0 is detected, this bit is set to 1.

D9ERR0ST bit (DSMIF9 Error 0 Status)

This bit indicates that a DSMIF9 error 0 interrupt request has been generated.

When DSMIF9 error 0 is detected, this bit is set to 1.

19.2.8 ICSR8 : Input Level Control/Status Register 8

Base address: POE3 = 0x9001_8000

Offset address: 0x30

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9ERR1ST	D8ERR1ST	D7ERR1ST	D6ERR1ST	D5ERR1ST	D4ERR1ST	D3ERR1ST	D2ERR1ST	D1ERR1ST	D0ERR1ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0ERR1ST	DSMIF0 Error 1 Status 0: Indicates that DSMIF0 error 1 has not been generated 1: Indicates that DSMIF0 error 1 has been generated	R

Bit	Symbol	Function	R/W
1	D1ERR1ST	DSMIF1 Error 1 Status 0: Indicates that DSMIF1 error 1 has not been generated 1: Indicates that DSMIF1 error 1 has been generated	R
2	D2ERR1ST	DSMIF2 Error 1 Status 0: Indicates that DSMIF2 error 1 has not been generated 1: Indicates that DSMIF2 error 1 has been generated	R
3	D3ERR1ST	DSMIF3 Error 1 Status 0: Indicates that DSMIF3 error 1 has not been generated 1: Indicates that DSMIF3 error 1 has been generated	R
4	D4ERR1ST	DSMIF4 Error 1 Status 0: Indicates that DSMIF4 error 1 has not been generated 1: Indicates that DSMIF4 error 1 has been generated	R
5	D5ERR1ST	DSMIF5 Error 1 Status 0: Indicates that DSMIF5 error 1 has not been generated 1: Indicates that DSMIF5 error 1 has been generated	R
6	D6ERR1ST	DSMIF6 Error 1 Status 0: Indicates that DSMIF6 error 1 has not been generated 1: Indicates that DSMIF6 error 1 has been generated	R
7	D7ERR1ST	DSMIF7 Error 1 Status 0: Indicates that DSMIF7 error 1 has not been generated 1: Indicates that DSMIF7 error 1 has been generated	R
8	D8ERR1ST	DSMIF8 Error 1 Status 0: Indicates that DSMIF8 error 1 has not been generated 1: Indicates that DSMIF8 error 1 has been generated	R
9	D9ERR1ST	DSMIF9 Error 1 Status 0: Indicates that DSMIF9 error 1 has not been generated 1: Indicates that DSMIF9 error 1 has been generated	R
15:10	—	These bits are read as 0.	R

The ICSR8 register indicates DSMIF error 1 status.

D0ERR1ST bit (DSMIF0 Error 1 Status)

This bit indicates that a DSMIF0 error 1 interrupt request has been generated.

When DSMIF0 error 1 is detected, this bit is set to 1.

D1ERR1ST bit (DSMIF1 Error 1 Status)

This bit indicates that a DSMIF1 error 1 interrupt request has been generated.

When DSMIF1 error 1 is detected, this bit is set to 1.

D2ERR1ST bit (DSMIF2 Error 1 Status)

This bit indicates that a DSMIF2 error 1 interrupt request has been generated.

When DSMIF2 error 1 is detected, this bit is set to 1.

D3ERR1ST bit (DSMIF3 Error 1 Status)

This bit indicates that a DSMIF3 error 1 interrupt request has been generated.

When DSMIF3 error 1 is detected, this bit is set to 1.

D4ERR1ST bit (DSMIF4 Error 1 Status)

This bit indicates that a DSMIF4 error 1 interrupt request has been generated.

When DSMIF4 error 1 is detected, this bit is set to 1.

D5ERR1ST bit (DSMIF5 Error 1 Status)

This bit indicates that a DSMIF5 error 1 interrupt request has been generated.

When DSMIF5 error 1 is detected, this bit is set to 1.

D6ERR1ST bit (DSMIF6 Error 1 Status)

This bit indicates that a DSMIF6 error 1 interrupt request has been generated.

When DSMIF6 error 1 is detected, this bit is set to 1.

D7ERR1ST bit (DSMIF7 Error 1 Status)

This bit indicates that a DSMIF7 error 1 interrupt request has been generated.

When DSMIF7 error 1 is detected, this bit is set to 1.

D8ERR1ST bit (DSMIF8 Error 1 Status)

This bit indicates that a DSMIF8 error 1 interrupt request has been generated.

When DSMIF8 error 1 is detected, this bit is set to 1.

D9ERR1ST bit (DSMIF9 Error 1 Status)

This bit indicates that a DSMIF9 error 1 interrupt request has been generated.

When DSMIF9 error 1 is detected, this bit is set to 1.

19.2.9 ICSR9 : Input Level Control/Status Register 9

Base address: POE3 = 0x9001_8000

Offset address: 0x32

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9ER R0IE	D8ER R0IE	D7ER R0IE	D6ER R0IE	D5ER R0IE	D4ER R0IE	D3ER R0IE	D2ER R0IE	D1ER R0IE	D0ER R0IE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0ERR0IE	DSMIF0 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
1	D1ERR0IE	DSMIF1 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
2	D2ERR0IE	DSMIF2 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
3	D3ERR0IE	DSMIF3 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
4	D4ERR0IE	DSMIF4 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
5	D5ERR0IE	DSMIF5 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
6	D6ERR0IE	DSMIF6 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
7	D7ERR0IE	DSMIF7 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W

Bit	Symbol	Function	R/W
8	D8ERR0IE	DSMIF8 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
9	D9ERR0IE	DSMIF9 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

The ICSR9 register controls the high-impedance for DSMIF error 0.

D0ERR0IE bit (DSMIF0 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF0 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D1ERR0IE bit (DSMIF1 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF1 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D2ERR0IE bit (DSMIF2 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF2 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D3ERR0IE bit (DSMIF3 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF3 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D4ERR0IE bit (DSMIF4 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF4 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D5ERR0IE bit (DSMIF5 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF5 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D6ERR0IE bit (DSMIF6 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF6 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D7ERR0IE bit (DSMIF7 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF7 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D8ERR0IE bit (DSMIF8 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF8 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D9ERR0IE bit (DSMIF9 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF9 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

19.2.10 ICSR10 : Input Level Control/Status Register 10

Base address: POE3 = 0x9001_8000

Offset address: 0x34

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9ERR1IE	D8ERR1IE	D7ERR1IE	D6ERR1IE	D5ERR1IE	D4ERR1IE	D3ERR1IE	D2ERR1IE	D1ERR1IE	D0ERR1IE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0ERR1IE	DSMIF0 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
1	D1ERR1IE	DSMIF1 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
2	D2ERR1IE	DSMIF2 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
3	D3ERR1IE	DSMIF3 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
4	D4ERR1IE	DSMIF4 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
5	D5ERR1IE	DSMIF5 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
6	D6ERR1IE	DSMIF6 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
7	D7ERR1IE	DSMIF7 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
8	D8ERR1IE	DSMIF8 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
9	D9ERR1IE	DSMIF9 Error 1 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

The ICSR10 register controls the high-impedance for DSMIF error 1.

D0ERR1IE bit (DSMIF0 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF0 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D1ERR1IE bit (DSMIF1 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF1 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D2ERR1IE bit (DSMIF2 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF2 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D3ERR1IE bit (DSMIF3 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF3 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D4ERR1IE bit (DSMIF4 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF4 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D5ERR1IE bit (DSMIF5 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF5 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D6ERR1IE bit (DSMIF6 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF6 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D7ERR1IE bit (DSMIF7 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF7 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D8ERR1IE bit (DSMIF8 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF8 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D9ERR1IE bit (DSMIF9 Error 1 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF9 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

19.2.11 OCSR1 : Output Level Control/Status Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	OIE1	Output Short Circuit Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	OCE1	Output Short Circuit High-Impedance Enable 1 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W*1
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	OSF1	Output Short Circuit Flag 1 0: Indicates that outputs have not simultaneously become an active level 1: Indicates that outputs have simultaneously become an active level	R/W*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The OCSR1 register controls the enable or disable of output-level comparison and interrupts and indicates status.

OIE1 bit (Output Short Circuit Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 flag is set to 1.

OCE1 bit (Output Short Circuit High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 flag (Output Short Circuit Flag 1)

This flag indicates that any one of the three pairs of 2-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of 2-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to the OSF1 flag after reading OSF1 = 1

19.2.12 OCSR2 : Output Level Control/Status Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x06

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	OIE2	Output Short Circuit Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	OCE2	Output Short Circuit High-Impedance Enable 2 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W*1
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	OSF2	Output Short Circuit Flag 2 0: Indicates that outputs have not simultaneously become an active level 1: Indicates that outputs have simultaneously become an active level	R/W*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The OCSR2 register controls the enable or disable of output-level comparison and interrupts and indicates status.

OIE2 bit (Output Short Circuit Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 flag in OCSR2 is set to 1.

OCE2 bit (Output Short Circuit High-Impedance Enable 2)

This bit specifies whether to place the pins in the high-impedance state when the OSF2 flag in OCSR2 is set to 1.

OSF2 flag (Output Short Circuit Flag 2)

This flag indicates that any one of the three pairs of 2-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of 2-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to the OSF2 flag after reading OSF2 = 1

19.2.13 ALR1 : Active Level Setting Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x1A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	OLSEN	—	OLSG2B	OLSG2A	OLSG1B	OLSG1A	OLSG0B	OLSG0A
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLSG0A	MTIOC3B Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
1	OLSG0B	MTIOC3D Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
2	OLSG1A	MTIOC4A Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
3	OLSG1B	MTIOC4C Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
4	OLSG2A	MTIOC4B Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
5	OLSG2B	MTIOC4D Pin Active Level Setting 0: Active low 1: Active high	R/W*1
6	—	This bit is read as 0. The write value should be 0.	R/W
7	OLSEN	Active Level Setting Enable 0: Disabled 1: Enabled	R/W*1
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The ALR1 register specifies the active levels of the MTU outputs selected by the I/O Ports, as the active levels for detection of short circuits of those outputs reflected in OCSR1.

OLSG0A bit (MTIOC3B Pin Active Level Setting)

This bit sets the active level of the MTIOC3B output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG0B bit (MTIOC3D Pin Active Level Setting)

This bit sets the active level of the MTIOC3D output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1A bit (MTIOC4A Pin Active Level Setting)

This bit sets the active level of the MTIOC4A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1B bit (MTIOC4C Pin Active Level Setting)

This bit sets the active level of the MTIOC4C output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2A bit (MTIOC4B Pin Active Level Setting)

This bit sets the active level of the MTIOC4B output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2B bit (MTIOC4D Pin Active Level Setting)

This bit sets the active level of the MTIOC4D output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSEN bit (Active Level Setting Enable)

This bit enables or disables the active-level settings in the OLSGnm bits (n = 0 to 2; m = A, B). Clearing the OLSEN bit to 0 disables the OLSGnm bits, in which case the active levels of the MTU output are determined by the MTU.TOCR1A and MTU.TOCR2A registers. Setting the OLSEN bit to 1 enables the OLSGnm bits, in which case the active levels of the MTU output are as selected by the OLSGnm bits in this register.

19.2.14 SPOER : Software Port Output Enable Register

Base address: POE3 = 0x9001_8000

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MTUCH34HIZ	MTU3 and MTU4 Output High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
1	MTUCH67HIZ	MTU6 and MTU7 Output High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
2	MTUCH0HIZ	MTU0 Pin High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The SPOER register controls the high-impedance state of the pins.

MTUCH34HIZ bit (MTU3 and MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, and MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH34HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH34HIZ bit after reading MTUCH34HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

MTUCH67HIZ bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in the high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH67HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH67HIZ bit after reading MTUCH67HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

MTUCH0HIZ bit (MTU0 Pin High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in the high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH0HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH0HIZ bit after reading MTUCH0HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

19.2.15 POECR1 : Port Output Enable Control Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MTU0 DZE	MTU0 CZE	MTU0 BZE	MTU0 AZE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MTU0AZE	MTIOC0A High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
1	MTU0BZE	MTIOC0B High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
2	MTU0CZE	MTIOC0C High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
3	MTU0DZE	MTIOC0D High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR1 register controls high-impedance state of the MTU0 pins.

MTU0AZE bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag

(n = 1, 2, 4, 5; m = 0, 4, 10, 11) specified in the POECR5 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR7 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR8 register, is set to 1.

MTU0BZE bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11) specified in the POECR5 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR7 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR8 register, is set to 1.

MTU0CZE bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11) specified in the POECR5 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR7 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR8 register, is set to 1.

MTU0DZE bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11) specified in the POECR5 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR7 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR8 register, is set to 1.

19.2.16 POECR2 : Port Output Enable Control Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	MTU3 BDZE	MTU4 ACZE	MTU4 BDZE	—	—	—	—	—	MTU6 BDZE	MTU7 ACZE	MTU7 BDZE
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
0	MTU7BDZE	MTIOC7B/MTIOC7D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
1	MTU7ACZE	MTIOC7A/MTIOC7C High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
2	MTU6BDZE	MTIOC6B/MTIOC6D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	MTU4BDZE	MTIOC4B/MTIOC4D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
9	MTU4ACZE	MTIOC4A/MTIOC4C High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
10	MTU3BDZE	MTIOC3B/MTIOC3D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR2 register controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

MTU7BDZE bit (MTIOC7B/MTIOC7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU7 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR11 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR12 register, is set to 1.

MTU7ACZE bit (MTIOC7A/MTIOC7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU7 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR11 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR12 register, is set to 1.

MTU6BDZE bit (MTIOC6B/MTIOC6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU6 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR11 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR12 register, is set to 1.

MTU4BDZE bit (MTIOC4B/MTIOC4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR9 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR10 register, is set to 1.

MTU4ACZE bit (MTIOC4A/MTIOC4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR9 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR10 register, is set to 1.

MTU3BDZE bit (MTIOC3B/MTIOC3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11) specified in the POECR4 register, ICSR7.DmERR0ST (m = 0 to 9) specified in the POECR9 register, or ICSR8.DmERR1ST (m = 0 to 9) specified in the POECR10 register, is set to 1.

19.2.17 POECR4 : Port Output Enable Control Register 4

Base address: POE3 = 0x9001_8000

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	IC5ADDMT67ZE	IC4ADDMT67ZE	IC3ADDMT67ZE	—	IC1ADDMT67ZE	—	—	—	IC5ADDMT34ZE	IC4ADDMT34ZE	IC3ADDMT34ZE	IC2ADDMT34ZE	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
2	IC2ADDMT34ZE	MTU3 and MTU4 High-Impedance POE4F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
3	IC3ADDMT34ZE	MTU3 and MTU4 High-Impedance POE8F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
4	IC4ADDMT34ZE	MTU3 and MTU4 High-Impedance POE10F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
5	IC5ADDMT34ZE	MTU3 and MTU4 High-Impedance POE11F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
8:6	—	These bits are read as 0. The write value should be 0.	R/W
9	IC1ADDMT67ZE	MTU6 and MTU7 High-Impedance POE0F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
10	—	This bit is read as 0. The write value should be 0.	R/W
11	IC3ADDMT67ZE	MTU6 and MTU7 High-Impedance POE8F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
12	IC4ADDMT67ZE	MTU6 and MTU7 High-Impedance POE10F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
13	IC5ADDMT67ZE	MTU6 and MTU7 High-Impedance POE11F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR4 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7).

For details about the targets and conditions of high-impedance control, see Figure 19.2.

IC2ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the ICSR2.POE4F flag (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC3ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the ICSR3.POE8F flag (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC4ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC5ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the ICSR1.POE0F flag (POE0#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC3ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the ICSR3.POE8F flag (POE8#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC4ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC5ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

19.2.18 POECR5 : Port Output Enable Control Register 5

Base address: POE3 = 0x9001_8000

Offset address: 0x12

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	IC5ADDMT0ZE	IC4ADDMT0ZE	—	IC2ADDMT0ZE	IC1ADDMT0ZE	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	IC1ADDMT0ZE	MTU0 High-Impedance POE0F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
2	IC2ADDMT0ZE	MTU0 High-Impedance POE4F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
3	—	This bit is read as 0. The write value should be 0.	R/W
4	IC4ADDMT0ZE	MTU0 High-Impedance POE10F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
5	IC5ADDMT0ZE	MTU0 High-Impedance POE11F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
15:6	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR5 register is used to extend the control conditions to place the output of the MTU0 pins in the high-impedance state.

IC1ADDMT0ZE bit (MTU0 High-Impedance POE0F Add)

Adds the ICSR1.POE0F flag (POE0#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE bit (MTU0 High-Impedance POE4F Add)

Adds the ICSR2.POE4F flag (POE4#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC4ADDMT0ZE bit (MTU0 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC5ADDMT0ZE bit (MTU0 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

19.2.19 POECR7 : Port Output Enable Control Register 7

Base address: POE3 = 0x9001_8000

Offset address: 0x36

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E0A DDMT 0ZE	D8E0A DDMT 0ZE	D7E0A DDMT 0ZE	D6E0A DDMT 0ZE	D5E0A DDMT 0ZE	D4E0A DDMT 0ZE	D3E0A DDMT 0ZE	D2E0A DDMT 0ZE	D1E0A DDMT 0ZE	D0E0A DDMT 0ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E0ADDMT0ZE	MTU0 High-Impedance D0ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E0ADDMT0ZE	MTU0 High-Impedance D1ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
2	D2E0ADDMT0ZE	MTU0 High-Impedance D2ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E0ADDMT0ZE	MTU0 High-Impedance D3ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
4	D4E0ADDMT0ZE	MTU0 High-Impedance D4ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E0ADDMT0ZE	MTU0 High-Impedance D5ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E0ADDMT0ZE	MTU0 High-Impedance D6ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E0ADDMT0ZE	MTU0 High-Impedance D7ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E0ADDMT0ZE	MTU0 High-Impedance D8ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
9	D9E0ADDMT0ZE	MTU0 High-Impedance D9ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR7 register is used to extend the control conditions to place the output of the MTU0 pins in the high-impedance state.

D0E0ADDMT0ZE bit (MTU0 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D1E0ADDMT0ZE bit (MTU0 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D2E0ADDMT0ZE bit (MTU0 High-Impedance D2ERR0ST Add)

Adds the ICSR7.D2ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D3E0ADDMT0ZE bit (MTU0 High-Impedance D3ERR0ST Add)

Adds the ICSR7.D3ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D4E0ADDMT0ZE bit (MTU0 High-Impedance D4ERR0ST Add)

Adds the ICSR7.D4ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D5E0ADDMT0ZE bit (MTU0 High-Impedance D5ERR0ST Add)

Adds the ICSR7.D5ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D6E0ADDMT0ZE bit (MTU0 High-Impedance D6ERR0ST Add)

Adds the ICSR7.D6ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D7E0ADDMT0ZE bit (MTU0 High-Impedance D7ERR0ST Add)

Adds the ICSR7.D7ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D8E0ADDMT0ZE bit (MTU0 High-Impedance D8ERR0ST Add)

Adds the ICSR7.D8ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D9E0ADDMT0ZE bit (MTU0 High-Impedance D9ERR0ST Add)

Adds the ICSR7.D9ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

19.2.20 POECR8 : Port Output Enable Control Register 8

Base address: POE3 = 0x9001_8000

Offset address: 0x38

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E1ADDMT0ZE	D8E1ADDMT0ZE	D7E1ADDMT0ZE	D6E1ADDMT0ZE	D5E1ADDMT0ZE	D4E1ADDMT0ZE	D3E1ADDMT0ZE	D2E1ADDMT0ZE	D1E1ADDMT0ZE	D0E1ADDMT0ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E1ADDMT0ZE	MTU0 High-Impedance D0ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E1ADDMT0ZE	MTU0 High-Impedance D1ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1

Bit	Symbol	Function	R/W
2	D2E1ADDMT0ZE	MTU0 High-Impedance D2ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E1ADDMT0ZE	MTU0 High-Impedance D3ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
4	D4E1ADDMT0ZE	MTU0 High-Impedance D4ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E1ADDMT0ZE	MTU0 High-Impedance D5ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E1ADDMT0ZE	MTU0 High-Impedance D6ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E1ADDMT0ZE	MTU0 High-Impedance D7ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E1ADDMT0ZE	MTU0 High-Impedance D8ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
9	D9E1ADDMT0ZE	MTU0 High-Impedance D9ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR8 register is used to extend the control conditions to place the output of the MTU0 pins in the high-impedance state.

D0E1ADDMT0ZE bit (MTU0 High-Impedance D0ERR1ST Add)

Adds the ICSR8.D0ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D1E1ADDMT0ZE bit (MTU0 High-Impedance D1ERR1ST Add)

Adds the ICSR8.D1ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D2E1ADDMT0ZE bit (MTU0 High-Impedance D2ERR1ST Add)

Adds the ICSR8.D2ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D3E1ADDMT0ZE bit (MTU0 High-Impedance D3ERR1ST Add)

Adds the ICSR8.D3ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D4E1ADDMT0ZE bit (MTU0 High-Impedance D4ERR1ST Add)

Adds the ICSR8.D4ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D5E1ADDMT0ZE bit (MTU0 High-Impedance D5ERR1ST Add)

Adds the ICSR8.D5ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D6E1ADDMT0ZE bit (MTU0 High-Impedance D6ERR1ST Add)

Adds the ICSR8.D6ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D7E1ADDMT0ZE bit (MTU0 High-Impedance D7ERR1ST Add)

Adds the ICSR8.D7ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D8E1ADDMT0ZE bit (MTU0 High-Impedance D8ERR1ST Add)

Adds the ICSR8.D8ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D9E1ADDMT0ZE bit (MTU0 High-Impedance D9ERR1ST Add)

Adds the ICSR8.D9ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

19.2.21 POECR9 : Port Output Enable Control Register 9

Base address: POE3 = 0x9001_8000

Offset address: 0x3A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E0ADDMT34ZE	D8E0ADDMT34ZE	D7E0ADDMT34ZE	D6E0ADDMT34ZE	D5E0ADDMT34ZE	D4E0ADDMT34ZE	D3E0ADDMT34ZE	D2E0ADDMT34ZE	D1E0ADDMT34ZE	D0E0ADDMT34ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D0ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D1ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
2	D2E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D2ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D3ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
4	D4E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D4ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D5ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D6ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D7ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D8ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1

Bit	Symbol	Function	R/W
9	D9E0ADDMT34ZE	MTU3 and MTU4 High-Impedance D9ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR9 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU3 and MTU4).

D0E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D1E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D2E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D2ERR0ST Add)

Adds the ICSR7.D2ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D3E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D3ERR0ST Add)

Adds the ICSR7.D3ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D4E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D4ERR0ST Add)

Adds the ICSR7.D4ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D5E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D5ERR0ST Add)

Adds the ICSR7.D5ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D6E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D6ERR0ST Add)

Adds the ICSR7.D6ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D7E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D7ERR0ST Add)

Adds the ICSR7.D7ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D8E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D8ERR0ST Add)

Adds the ICSR7.D8ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D9E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D9ERR0ST Add)

Adds the ICSR7.D9ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

19.2.22 POECR10 : Port Output Enable Control Register 10

Base address: POE3 = 0x9001_8000

Offset address: 0x3C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E1ADDMT34ZE	D8E1ADDMT34ZE	D7E1ADDMT34ZE	D6E1ADDMT34ZE	D5E1ADDMT34ZE	D4E1ADDMT34ZE	D3E1ADDMT34ZE	D2E1ADDMT34ZE	D1E1ADDMT34ZE	D0E1ADDMT34ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D0ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D1ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
2	D2E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D2ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D3ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
4	D4E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D4ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D5ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D6ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D7ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D8ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
9	D9E1ADDMT34ZE	MTU3 and MTU4 High-Impedance D9ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR10 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU3 and MTU4).

D0E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D0ERR1ST Add)

Adds the ICSR8.D0ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D1E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D1ERR1ST Add)

Adds the ICSR8.D1ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D2E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D2ERR1ST Add)

Adds the ICSR8.D2ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D3E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D3ERR1ST Add)

Adds the ICSR8.D3ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D4E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D4ERR1ST Add)

Adds the ICSR8.D4ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D5E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D5ERR1ST Add)

Adds the ICSR8.D5ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D6E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D6ERR1ST Add)

Adds the ICSR8.D6ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D7E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D7ERR1ST Add)

Adds the ICSR8.D7ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D8E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D8ERR1ST Add)

Adds the ICSR8.D8ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D9E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D9ERR1ST Add)

Adds the ICSR8.D9ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

19.2.23 POECR11 : Port Output Enable Control Register 11

Base address: POE3 = 0x9001_8000

Offset address: 0x3E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E0ADDMT67ZE	D8E0ADDMT67ZE	D7E0ADDMT67ZE	D6E0ADDMT67ZE	D5E0ADDMT67ZE	D4E0ADDMT67ZE	D3E0ADDMT67ZE	D2E0ADDMT67ZE	D1E0ADDMT67ZE	D0E0ADDMT67ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D0ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D1ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
2	D2E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D2ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D3ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1

Bit	Symbol	Function	R/W
4	D4E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D4ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D5ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D6ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D7ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D8ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
9	D9E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D9ERR0ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR11 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU6 and MTU7).

D0E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D1E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D2E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D2ERR0ST Add)

Adds the ICSR7.D2ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D3E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D3ERR0ST Add)

Adds the ICSR7.D3ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D4E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D4ERR0ST Add)

Adds the ICSR7.D4ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D5E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D5ERR0ST Add)

Adds the ICSR7.D5ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D6E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D6ERR0ST Add)

Adds the ICSR7.D6ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D7E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D7ERR0ST Add)

Adds the ICSR7.D7ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D8E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D8ERR0ST Add)

Adds the ICSR7.D8ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D9E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D9ERR0ST Add)

Adds the ICSR7.D9ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

19.2.24 POECR12 : Port Output Enable Control Register 12

Base address: POE3 = 0x9001_8000

Offset address: 0x40

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	D9E1ADDMT67ZE	D8E1ADDMT67ZE	D7E1ADDMT67ZE	D6E1ADDMT67ZE	D5E1ADDMT67ZE	D4E1ADDMT67ZE	D3E1ADDMT67ZE	D2E1ADDMT67ZE	D1E1ADDMT67ZE	D0E1ADDMT67ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D0ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
1	D1E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D1ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
2	D2E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D2ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
3	D3E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D3ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
4	D4E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D4ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
5	D5E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D5ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
6	D6E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D6ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
7	D7E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D7ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
8	D8E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D8ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
9	D9E1ADDMT67ZE	MTU6 and MTU7 High-Impedance D9ERR1ST Add 0: Does not add the status to the high-impedance control conditions 1: Adds the status to the high-impedance control conditions	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR12 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU6 and MTU7).

D0E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D0ERR1ST Add)

Adds the ICSR8.D0ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D1E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D1ERR1ST Add)

Adds the ICSR8.D1ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D2E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D2ERR1ST Add)

Adds the ICSR8.D2ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D3E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D3ERR1ST Add)

Adds the ICSR8.D3ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D4E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D4ERR1ST Add)

Adds the ICSR8.D4ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D5E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D5ERR1ST Add)

Adds the ICSR8.D5ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D6E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D6ERR1ST Add)

Adds the ICSR8.D6ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D7E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D7ERR1ST Add)

Adds the ICSR8.D7ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D8E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D8ERR1ST Add)

Adds the ICSR8.D8ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D9E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D9ERR1ST Add)

Adds the ICSR8.D9ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

19.2.25 M0SELR1 : MTU0 Pin Select Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M0BSEL[3:0]				M0ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M0ASEL[3:0]	MTU0-A (MTIOC0A) Pin Select 0x0: Controls the high-impedance state of P01_6 when it is in use as the MTIOC0A pin 0x1: Controls the high-impedance state of P04_7 when it is in use as the MTIOC0A pin 0x2: Controls the high-impedance state of P10_5 when it is in use as the MTIOC0A pin Others: Setting prohibited.	R/W*1

Bit	Symbol	Function	R/W
7:4	M0BSEL[3:0]	MTU0-B (MTIOC0B) Pin Select 0x0: Controls the high-impedance state of P01_7 when it is in use as the MTIOC0B pin 0x1: Controls the high-impedance state of P05_0 when it is in use as the MTIOC0B pin 0x2: Controls the high-impedance state of P10_6 when it is in use as the MTIOC0B pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M0SELR1 register is an 8-bit readable/writable register that selects the MTU0-A/B pins as targets for high-impedance control.

M0ASEL[3:0] bits (MTU0-A (MTIOC0A) Pin Select)

These bits select the target MTIOC0A pin for high-impedance control.

M0BSEL[3:0] bits (MTU0-B (MTIOC0B) Pin Select)

These bits select the target MTIOC0B pin for high-impedance control.

19.2.26 M0SELR2 : MTU0 Pin Select Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x25

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M0DSEL[3:0]				M0CSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M0CSEL[3:0]	MTU0-C (MTIOC0C) Pin Select 0x0: Controls the high-impedance state of P02_0 when it is in use as the MTIOC0C pin 0x1: Controls the high-impedance state of P04_5 when it is in use as the MTIOC0C pin Others: Setting prohibited.	R/W*1
7:4	M0DSEL[3:0]	MTU0-D (MTIOC0D) Pin Select 0x0: Controls the high-impedance state of P02_1 when it is in use as the MTIOC0D pin 0x1: Controls the high-impedance state of P04_6 when it is in use as the MTIOC0D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M0SELR2 register is an 8-bit readable/writable register that selects the MTU0-C/D pins as targets for high-impedance control.

M0CSEL[3:0] bits (MTU0-C (MTIOC0C) Pin Select)

These bits select the target MTIOC0C pin for high-impedance control.

M0DSEL[3:0] bits (MTU0-D (MTIOC0D) Pin Select)

These bits select the target MTIOC0D pin for high-impedance control.

19.2.27 M3SELR : MTU3 Pin Select Register

Base address: POE3 = 0x9001_8000

Offset address: 0x26

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M3DSEL[3:0]				M3BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M3BSEL[3:0]	MTU3-B (MTIOC3B) Pin Select 0x0: Controls the high-impedance state of P00_0 when it is in use as the MTIOC3B pin 0x1: Controls the high-impedance state of P02_5 when it is in use as the MTIOC3B pin Others: Setting prohibited.	R/W*1
7:4	M3DSEL[3:0]	MTU3-D (MTIOC3D) Pin Select 0x0: Controls the high-impedance state of P00_1 when it is in use as the MTIOC3D pin 0x1: Controls the high-impedance state of P02_6 when it is in use as the MTIOC3D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M3SELR register is an 8-bit readable/writable register that selects the MTU3-B/D pins as targets for high-impedance control.

M3BSEL[3:0] bits (MTU3-B (MTIOC3B) Pin Select)

These bits select the target MTIOC3B pin for high-impedance control.

M3DSEL[3:0] bits (MTU3-D (MTIOC3D) Pin Select)

These bits select the target MTIOC3D pin for high-impedance control.

19.2.28 M4SELR1 : MTU4 Pin Select Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x27

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M4CSEL[3:0]				M4ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M4ASEL[3:0]	MTU4-A (MTIOC4A) Pin Select 0x0: Controls the high-impedance state of P00_2 when it is in use as the MTIOC4A pin 0x1: Controls the high-impedance state of P02_7 when it is in use as the MTIOC4A pin Others: Setting prohibited.	R/W*1
7:4	M4CSEL[3:0]	MTU4-C (MTIOC4C) Pin Select 0x0: Controls the high-impedance state of P00_3 when it is in use as the MTIOC4C pin 0x1: Controls the high-impedance state of P03_0 when it is in use as the MTIOC4C pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M4SELR1 register is an 8-bit readable/writable register that selects the MTU4-A/C pins as targets for high-impedance control.

M4ASEL[3:0] bits (MTU4-A (MTIOC4A) Pin Select)

These bits select the target MTIOC4A pin for high-impedance control.

M4CSEL[3:0] bits (MTU4-C (MTIOC4C) Pin Select)

These bits select the target MTIOC4C pin for high-impedance control.

19.2.29 M4SELR2 : MTU4 Pin Select Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M4DSEL[3:0]				M4BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M4BSEL[3:0]	MTU4-B (MTIOC4B) Pin Select 0x0: Controls the high-impedance state of P00_4 when it is in use as the MTIOC4B pin 0x1: Controls the high-impedance state of P03_1 when it is in use as the MTIOC4B pin Others: Setting prohibited.	R/W*1
7:4	M4DSEL[3:0]	MTU4-D (MTIOC4D) Pin Select 0x0: Controls the high-impedance state of P00_5 when it is in use as the MTIOC4D pin 0x1: Controls the high-impedance state of P03_2 when it is in use as the MTIOC4D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M4SELR2 register is an 8-bit readable/writable register that selects the MTU4-B/D pins as targets for high-impedance control.

M4BSEL[3:0] bits (MTU4-B (MTIOC4B) Pin Select)

These bits select the target MTIOC4B pin for high-impedance control.

M4DSEL[3:0] bits (MTU4-D (MTIOC4D) Pin Select)

These bits select the target MTIOC4D pin for high-impedance control.

19.2.30 M6SELR : MTU6 Pin Select Register

Base address: POE3 = 0x9001_8000

Offset address: 0x2A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M6DSEL[3:0]				M6BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M6BSEL[3:0]	MTU6-B (MTIOC6B) Pin Select 0x0: Controls the high-impedance state of P01_2 when it is in use as the MTIOC6B pin 0x1: Controls the high-impedance state of P03_7 when it is in use as the MTIOC6B pin 0x2: Controls the high-impedance state of P09_4 when it is in use as the MTIOC6B pin Others: Setting prohibited.	R/W*1
7:4	M6DSEL[3:0]	MTU6-D (MTIOC6D) Pin Select 0x0: Controls the high-impedance state of P01_3 when it is in use as the MTIOC6D pin 0x1: Controls the high-impedance state of P04_0 when it is in use as the MTIOC6D pin 0x2: Controls the high-impedance state of P09_5 when it is in use as the MTIOC6D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M6SELR register is an 8-bit readable/writable register that selects the MTU6-B/D pins as targets for high-impedance control.

M6BSEL[3:0] bits (MTU6-B (MTIOC6B) Pin Select)

These bits select the target MTIOC6B pin for high-impedance control.

M6DSEL[3:0] bits (MTU6-D (MTIOC6D) Pin Select)

These bits select the target MTIOC6D pin for high-impedance control.

19.2.31 M7SELR1 : MTU7 Pin Select Register 1

Base address: POE3 = 0x9001_8000

Offset address: 0x2B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M7CSEL[3:0]				M7ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M7ASEL[3:0]	MTU7-A (MTIOC7A) Pin Select 0x0: Controls the high-impedance state of P01_4 when it is in use as the MTIOC7A pin 0x1: Controls the high-impedance state of P04_1 when it is in use as the MTIOC7A pin 0x2: Controls the high-impedance state of P09_6 when it is in use as the MTIOC7A pin Others: Setting prohibited.	R/W*1
7:4	M7CSEL[3:0]	MTU7-C (MTIOC7C) Pin Select 0x0: Controls the high-impedance state of P01_5 when it is in use as the MTIOC7C pin 0x1: Controls the high-impedance state of P04_2 when it is in use as the MTIOC7C pin 0x2: Controls the high-impedance state of P09_7 when it is in use as the MTIOC7C pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M7SELR1 register is an 8-bit readable/writable register that selects the MTU7-A/C pins as targets for high-impedance control.

M7ASEL[3:0] bits (MTU7-A (MTIOC7A) Pin Select)

The M7ASEL[3:0] bits select the target MTIOC7A pin for high-impedance control.

M7CSEL[3:0] bits (MTU7-C (MTIOC7C) Pin Select)

The M7CSEL[3:0] bits select the target MTIOC7C pin for high-impedance control.

19.2.32 M7SELR2 : MTU7 Pin Select Register 2

Base address: POE3 = 0x9001_8000

Offset address: 0x2C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M7DSEL[3:0]				M7BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M7BSEL[3:0]	MTU7-B (MTIOC7B) Pin Select 0x0: Controls the high-impedance state of P01_6 when it is in use as the MTIOC7B pin 0x1: Controls the high-impedance state of P04_3 when it is in use as the MTIOC7B pin 0x2: Controls the high-impedance state of P10_0 when it is in use as the MTIOC7B pin Others: Setting prohibited.	R/W*1

Bit	Symbol	Function	R/W
7:4	M7DSEL[3:0]	MTU7-D (MTIOC7D) Pin Select 0x0: Controls the high-impedance state of P01_7 when it is in use as the MTIOC7D pin 0x1: Controls the high-impedance state of P04_4 when it is in use as the MTIOC7D pin 0x2: Controls the high-impedance state of P10_1 when it is in use as the MTIOC7D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M7SELR2 register is an 8-bit readable/writable register that selects the MTU7-B/D pins as targets for high-impedance control.

M7BSEL[3:0] bits (MTU7-B (MTIOC7B) Pin Select)

The M7BSEL[3:0] bits select the target MTIOC7B pin for high-impedance control.

M7DSEL[3:0] bits (MTU7-D (MTIOC7D) Pin Select)

The M7DSEL[3:0] bits select the target MTIOC7D pin for high-impedance control.

19.3 Operation

Table 19.4 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 19.4 Target pins and conditions for high-impedance control (1 of 6)

Pins	Conditions	Detailed conditions
MTU3 pins (MTIOC3B and MTIOC3D)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC3B and MTIOC3D pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt specified in the POECR9 and POECR10	MTU3BDZE • ((POE0F) + (OSF1 • OCE1) + (MTUCH34HIZ) + (IC2ADDMT34ZE • POE4F) + (IC3ADDMT34ZE • POE8E • POE8F) + (IC4ADDMT34ZE • POE10E • POE10F) + (IC5ADDMT34ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E0ADDMT34ZE • D0ERR0ST) + (D0E1ADDMT34ZE • D0ERR1ST) + (D1E0ADDMT34ZE • D1ERR0ST) + (D1E1ADDMT34ZE • D1ERR1ST) + (D2E0ADDMT34ZE • D2ERR0ST) + (D2E1ADDMT34ZE • D2ERR1ST) + (D3E0ADDMT34ZE • D3ERR0ST) + (D3E1ADDMT34ZE • D3ERR1ST) + (D4E0ADDMT34ZE • D4ERR0ST) + (D4E1ADDMT34ZE • D4ERR1ST) + (D5E0ADDMT34ZE • D5ERR0ST) + (D5E1ADDMT34ZE • D5ERR1ST) + (D6E0ADDMT34ZE • D6ERR0ST) + (D6E1ADDMT34ZE • D6ERR1ST) + (D7E0ADDMT34ZE • D7ERR0ST) + (D7E1ADDMT34ZE • D7ERR1ST) + (D8E0ADDMT34ZE • D8ERR0ST) + (D8E1ADDMT34ZE • D8ERR1ST) + (D9E0ADDMT34ZE • D9ERR0ST) + (D9E1ADDMT34ZE • D9ERR1ST))

Table 19.4 Target pins and conditions for high-impedance control (2 of 6)

Pins	Conditions	Detailed conditions
MTU4 pins (MTIOC4A and MTIOC4C)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC4A and MTIOC4C pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt specified in the POECR9 and POECR10	MTU4ACZE • ((POE0F) + (OSF1 • OCE1) + (MTUCH34HIZ) + (IC2ADDMT34ZE • POE4F) + (IC3ADDMT34ZE • POE8E • POE8F) + (IC4ADDMT34ZE • POE10E • POE10F) + (IC5ADDMT34ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E0ADDMT34ZE • D0ERR0ST) + (D0E1ADDMT34ZE • D0ERR1ST) + (D1E0ADDMT34ZE • D1ERR0ST) + (D1E1ADDMT34ZE • D1ERR1ST) + (D2E0ADDMT34ZE • D2ERR0ST) + (D2E1ADDMT34ZE • D2ERR1ST) + (D3E0ADDMT34ZE • D3ERR0ST) + (D3E1ADDMT34ZE • D3ERR1ST) + (D4E0ADDMT34ZE • D4ERR0ST) + (D4E1ADDMT34ZE • D4ERR1ST) + (D5E0ADDMT34ZE • D5ERR0ST) + (D5E1ADDMT34ZE • D5ERR1ST) + (D6E0ADDMT34ZE • D6ERR0ST) + (D6E1ADDMT34ZE • D6ERR1ST) + (D7E0ADDMT34ZE • D7ERR0ST) + (D7E1ADDMT34ZE • D7ERR1ST) + (D8E0ADDMT34ZE • D8ERR0ST) + (D8E1ADDMT34ZE • D8ERR1ST) + (D9E0ADDMT34ZE • D9ERR0ST) + (D9E1ADDMT34ZE • D9ERR1ST))

Figure 19.2 Target pins and conditions for high-impedance control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers:

- Input pins other than the POE0# pin for the MTU3 and MTU4 pins
- Input pins other than the POE4# pin for the MTU6 and MTU7 pins
- Input pins other than the POE8# pin for the MTU0 pins

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and MTU4 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input, POE10# input, POE11# input, stopped oscillation, oscillation abnormality, or DSMIF error can be controlled by the settings in the ICSR3 to ICSR10 registers. The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.

High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

19.3.1 MTU3 Pin Selection

In this LSI, the pin functions for MTU are respectively assigned to multiple sets of port pins. The target pins for high-impedance control can be selected by the pin select register in POE3 (M0SELR1, M0SELR2, M3SELR, M4SELR1, M4SELR2, M6SELR, M7SELR1, or M7SELR7 register). Table 19.5 shows the correspondence between MTU pins and select registers.

Note: Settings for pins to be used as MTU must be separately made in the registers of the I/O Ports. Take care so that there are no differences between the pins selected in the POE3 registers and the pins selected in the I/O port registers. For details of I/O port registers, see section 17, I/O Ports.

Table 19.5 Correspondence between MTU

MTU pin functions	Corresponding ports	Select registers
MTIOC0A	P01_6, P04_7, P10_5	M0SELR1
MTIOC0B	P01_7, P05_0, P10_6	
MTIOC0C	P02_0, P04_5	M0SELR2
MTIOC0D	P02_1, P04_6	
MTIOC3B	P00_0, P02_5	M3SELR

MTIOC4D	P00_5, P03_2	
MTIOC6B	P01_2, P03_7, P09_4	M6SELR
MTIOC6D	P01_3, P04_0, P09_5	
MTIOC7A	P01_4, P04_1, P09_6	M7SELR1
MTIOC7C	P01_5, P04_2, P09_7	
MTIOC7B	P01_6, P04_3, P10_0	M7SELR2
MTIOC7D	P01_7, P04_4, P10_1	

19.3.2 Input-Level Detection Operation

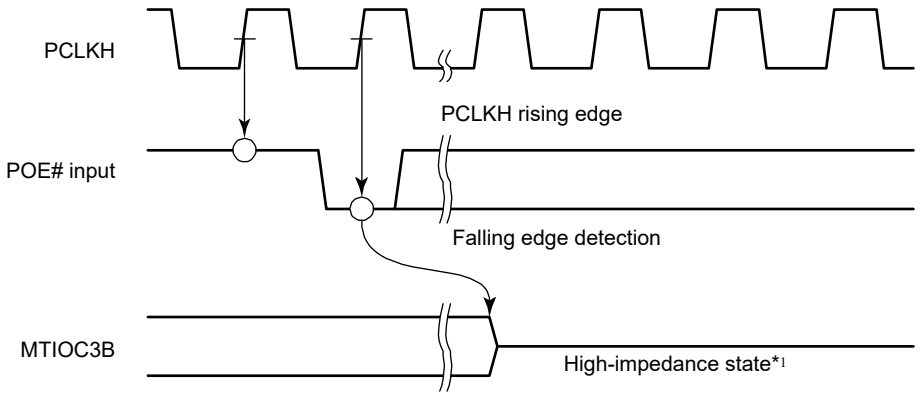
If the input conditions set by ICSR1 to ICSR5 occur on the POE0#, POE4#, POE8#, POE10#, and POE11# pins, the MTU3 and MTU4 pins for the MTU complementary PWM output, and MTU0 pins are placed in high-impedance state.

Note: These pins are still placed in the high-impedance state even when the MTU3 function is not selected for the pins on which they are multiplexed.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins, the pin functions which are multiplexed with the pins for the MTU complementary PWM output, and MTU0 pins are placed in high-impedance state.

Figure 19.3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins until the respective pins enter the high-impedance state.



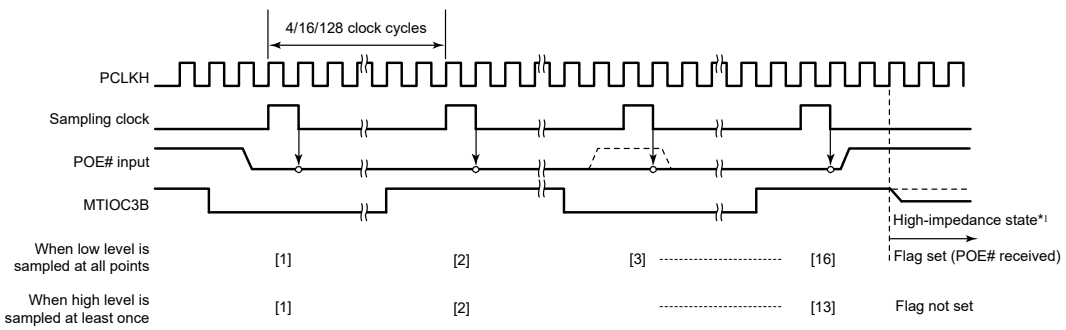
Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 19.3 Falling edge detection

(2) Low-Level Detection

Figure 19.4 shows the low-level detection operation. When the POE# input has been sampled 16 times at the clock pulses selected by ICSR1 to ICSR5 and all are low level, the request is accepted. If even one high level is detected during this interval, the request is not accepted.

The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the high-impedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 19.4 Low-level detection operation

19.3.3 Output-Level Compare Operation

Figure 19.5 shows an example of the output-level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

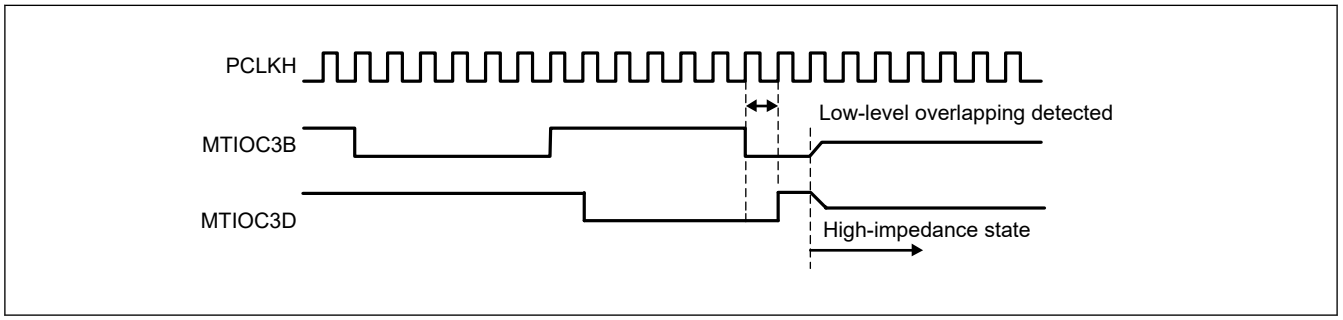


Figure 19.5 Output-level compare operation

19.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the Software Port Output Enable Register (SPOER).

For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the Port Output Enable Control Register 2 (POECR2) in the high-impedance state.

The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

19.3.5 High-Impedance Control through Detection of Stopped Oscillation and Oscillation Abnormality

When the clock monitor circuit detects the oscillation abnormality for PLLs and main clock, with the OSTSTE bit in ICSR6 set, the MTU3 and MTU4 or MTU6 and MTU7 pins if specified in the Port Output Enable Control Register 2 (POECR2), the MTU0 pins if specified in the Port Output Enable Control Register 1 (POECR1) can be placed in the high-impedance state.

19.3.6 Additional Functions for High-Impedance Control

Settings in the Port Output Enable Control Registers 4 to 5 (POECR4 to POECR5) can add additional high-impedance control conditions for the MTU complementary PWM output, MTU0 pins.

For instance, the following settings can be added as high-impedance control conditions for the MTU3 and MTU4 pins:

- Setting the POECR4.IC2ADDMT34ZE bit to 1 adds the input-level detection by the POE4# pin
- Setting the POECR4.IC3ADDMT34ZE bit to 1 and adds the input-level detection by the POE8# pin
- Setting the POECR4.IC4ADDMT34ZE bit to 1 and adds the input-level detection by the POE10# pin
- Setting the POECR4.IC5ADDMT34ZE bit to 1 and adds the input-level detection by the POE11# pin

The high-impedance control of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5 registers.

19.3.7 High-Impedance Control through Detection of DSMIF error

When DSMIFn (n = 0 to 9) detect error events, the MTU3 and MTU4 pins if specified in the POECR9 and POECR10, the MTU6 and MTU7 pins if specified in the POECR1 and POECR12, or the MTU0 pins if specified in the POECR7 and POECR8, can be placed in the high-impedance state.

19.3.8 Recover from High-Impedance State

The outputs which have been in the high-impedance state due to input-level detection can be recovered from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, ICSR4.POE10F, and ICSR5.POE11F flags. However, when low-level sampling is selected with the ICSR1.POE0M[1:0],

ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE11M[1:0] bits, just writing 0 to a flag is ignored (the flag is not set to 0). Flag can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins and is detected.

The outputs which have been in the high-impedance state due to output-level detection can be recovered from the state either by returning them to their initial state with a reset, or by setting the OCSR1.OSF1 flag or the OCSR2.OSF2 flag to 0. However, just writing 0 to a flag is ignored (the flag is not set to 0). Flag can be cleared by writing 0 to it only after setting the inactive level to be output from the pin. In the MTU, the inactive level (initial output level) can be output by stopping the count operation.

The outputs which have been in the high-impedance state due to SPOER register setting can be recovered from the state either by returning them to their initial state with reset, or by setting the SPOER.MTUCH34HIZ bit, SPOER.MTUCH67HIZ bit or SPOER.MTUCH0HIZ bit to 0.

The outputs which have been in the high-impedance state due to oscillation stop detection for PLLs and main clock can be recovered from the state by returning them to their initial state with a reset.

The outputs which have been in the high-impedance state due to DSMIF error detection can be recovered from the state either by returning them to their initial state with reset, or by clearing DSMIF error status flags.

19.4 POE3 Setting Procedure

The procedure for setting POE3 is described in the section that follows. It shows an example of high-impedance control in response to comparison of the output levels on the MTU3 pins (MTIOC3B/MTIOC3D). In the procedure, P00_0 is selected as the MTIOC3B pin and P00_1 is selected as the MTIOC3D pin.

Set the MTU3 pins (P00_0 and P00_1) for the peripheral function by the PMCm and PFCm registers of the I/O Ports before making the following settings:

1. Set PMC00.PMC0 and PMC00.PMC1 bit to 1.
   Set the PMC00 of the I/O Ports to select P00_0 and P00_1 for the peripheral function pins.
2. Set PFC00.PFC0[5:0] bits to 0x6 and PFC00.PFC1[5:0] bits to 0x6.
   Set the PFC00 register of the I/O Ports to select P00_0 for the MTIOC3B pin and P00_1 for the MTIOC3D pin.
3. Set the M3SELR.M3BSEL[3:0] bits to 0x0 and M3SELR.M3DSEL[3:0] bits to 0x0.
   Set the M3SELR register to control the high-impedance state of P00_0 for MTIOC3B and P00_1 for MTIOC3D.
4. Set the ALR1.OLSG0A and OLSG0B bits to 0 and the OLSEN bit to 1 to set MTIOC3B and MTIOC3D as active-low.
5. Set the POECR2.MTU3BDZE bit to 1 to enable high-impedance control on the MTIOC3B and MTIOC3D pins.
6. Specify the setting to operate MTU3.

After the above settings, if MTIOC3B (P00_0) and MTIOC3D (P00_1) are simultaneously at the low level, then the pins are placed in high-impedance state and the OCSR1.OSF1 bit is set.

For the method of releasing high-impedance, see section 19.3.8. Recover from High-Impedance State.

19.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input-level detection or output-level comparison. Table 19.6 shows the interrupt sources and their conditions.

Table 19.6 Interrupt sources and conditions (1 of 2)

Name	Interrupt source	Interrupt flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1 • POE0F + OIE1 • OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2 • POE4F + OIE2 • OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3 • POE8F

Table 19.6 Interrupt sources and conditions (2 of 2)

Name	Interrupt source	Interrupt flag	Condition
OEI4	Output enable interrupt 4	POE10F, POE11F, DnERR0ST, and DnERR1ST (n = 0 to 9)	PIE4 • POE10F + PIE5 • POE11F + D0ERR0IE • D0ERR0ST + D0ERR1IE • D0ERR1ST + D1ERR1IE • D1ERR0ST + D1ERR1IE • D1ERR1ST + D2ERR0IE • D2ERR0ST + D2ERR1IE • D2ERR1ST + D3ERR1IE • D3ERR0ST + D3ERR1IE • D3ERR1ST + D4ERR0IE • D4ERR0ST + D4ERR1IE • D4ERR1ST + D5ERR1IE • D5ERR0ST + D5ERR1IE • D5ERR1ST + D6ERR0IE • D6ERR0ST + D6ERR1IE • D6ERR1ST + D7ERR1IE • D7ERR0ST + D7ERR1IE • D7ERR1ST + D8ERR0IE • D8ERR0ST + D8ERR1IE • D8ERR1ST + D9ERR1IE • D9ERR0ST + D9ERR1IE • D9ERR1ST

19.6 Usage Notes

19.6.1 High-Impedance Control when the MTU is not Selected

If high-impedance control for a pin having a multiplexed MTU pin function on a register POECR1 to POECR2 is enabled and the high-impedance condition is satisfied, the pin is placed in the high-impedance state even if the MTU function is not selected for the pin on which it is multiplexed.

To avoid unintended high-impedance states, ensure that there are no differences between the settings for MTU pin selection in the PMCm and PFCm registers of the I/O Ports and for MTU pin selection in the pin select register of the POE.

20. General PWM Timer (GPT)

20.1 Overview

The LSI has a General PWM Timer (GPT) that is a 32-bit timer with 56 channels. These 56 channels are divided into four groups (LLPP (LLPP0 and LLPP1), NONSAFETY, and SAFETY). LLPP0 consists of 6 units, LLPP1 consists of 3 units, NONSAFETY and SAFETY consist of 1 unit respectively. Also, each unit is independent of each other. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer.

Table 20.1 lists the specifications for the GPT and Figure 20.1 shows a block diagram of the GPT. Table 20.2 lists the I/O pins and Table 20.3 lists the GPT interrupt sources.

Table 20.1 GPT specifications (1 of 2)

Parameter	Description
Number of units	11 units (unit 00 to 05 in LLPP0, unit 06 to 08 in LLPP1, unit 09 in NONSAFETY and unit 10 in SAFETY)
Number of channels	• Total 56 channels • 30 channels (6 units x 5 channels) in LLPP0 (GPT00_0 to GPT05_4) • 15 channels (3 units x 5 channels) in LLPP1 (GPT06_0 to GPT08_4) • 7 channels (1 unit x 7 channels) in NONSAFETY (GPT09_0 to GPT_09_6) • 4 channels (1 unit x 4 channels) in SAFETY (GPT10_0 to GPT10_3)
Functions	• 32 bits • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter • Clock sources independently selectable for each channel • 2 I/O pins per channel • 2 output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms • Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow • Generation of dead times in PWM operation • Count direction switching is available in the triangle-wave PWM modes • Synchronous starting, stopping, clearing, and switching counters for arbitrary channels within group (LLPP, NONSAFETY, SAFETY) • Starting, stopping, clearing, and switching up/down counters in response to a maximum of six ELC events for each unit in LLPP and eight for NONSAFETY • Starting, stopping, and clearing up/down counters in response to input level comparison • Starting, stopping, clearing, and switching up/down counters in response to a maximum of four external triggers • Output pin disable function by dead time error and detected short circuits between output pins • A/D converter start trigger can be generated • Compare match A to F event and overflow/underflow event can be output to the ELC for channels in LLPP and NONSAFETY • Enables the noise filter for input capture • Bus clock: PCLKH in LLPP, PCLKM in NONSAFETY, and PCLKM in SAFETY • Core clock: PCLKGPTL in LLPP, PCLKM in NONSAFETY, and PCLKM in SAFETY • Ch 4 input are selectable from ch3 and ch4 input signals for units in LLPP. It enables to realize phase counting and pulse width measurement at same time
Prescaler	• 9 dividing clocks are output • Selectable from any of core clock, core clock/2, core clock/4, core clock/8, core clock/16, core clock/32, core clock/64, core clock/256, core clock/1024
Interrupts	9 sources: • GTCCRA compare match/input capture (GPTm_n_CCMPA) • GTCCRB compare match/input capture (GPTm_n_CCMPB) • GTCCRC compare match (GPTm_n_CMPC) • GTCCRD compare match (GPTm_n_CMPD) • GTCCRE compare match (GPTm_n_CMPE) • GTCCRF compare match (GPTm_n_CMPF) • GTADTRA compare match (GPTm_n_ADTRGA) → only ELC for channels in LLPP and NONSAFETY • GTADTRB compare match (GPTm_n_ADTRGB) → only ELC for channels in LLPP and NONSAFETY • GTCNT overflow (GTPR compare match) (GPTm_n_OVF) • GTCNT underflow (GPTm_n_UDF) • Dead time error (GPTm_n_DTE) → only for channels in LLPP and NONSAFETY

Table 20.1 GPT specifications (2 of 2)

Parameter	Description
Module-stop function	Module-stop state can be set to reduce power consumption

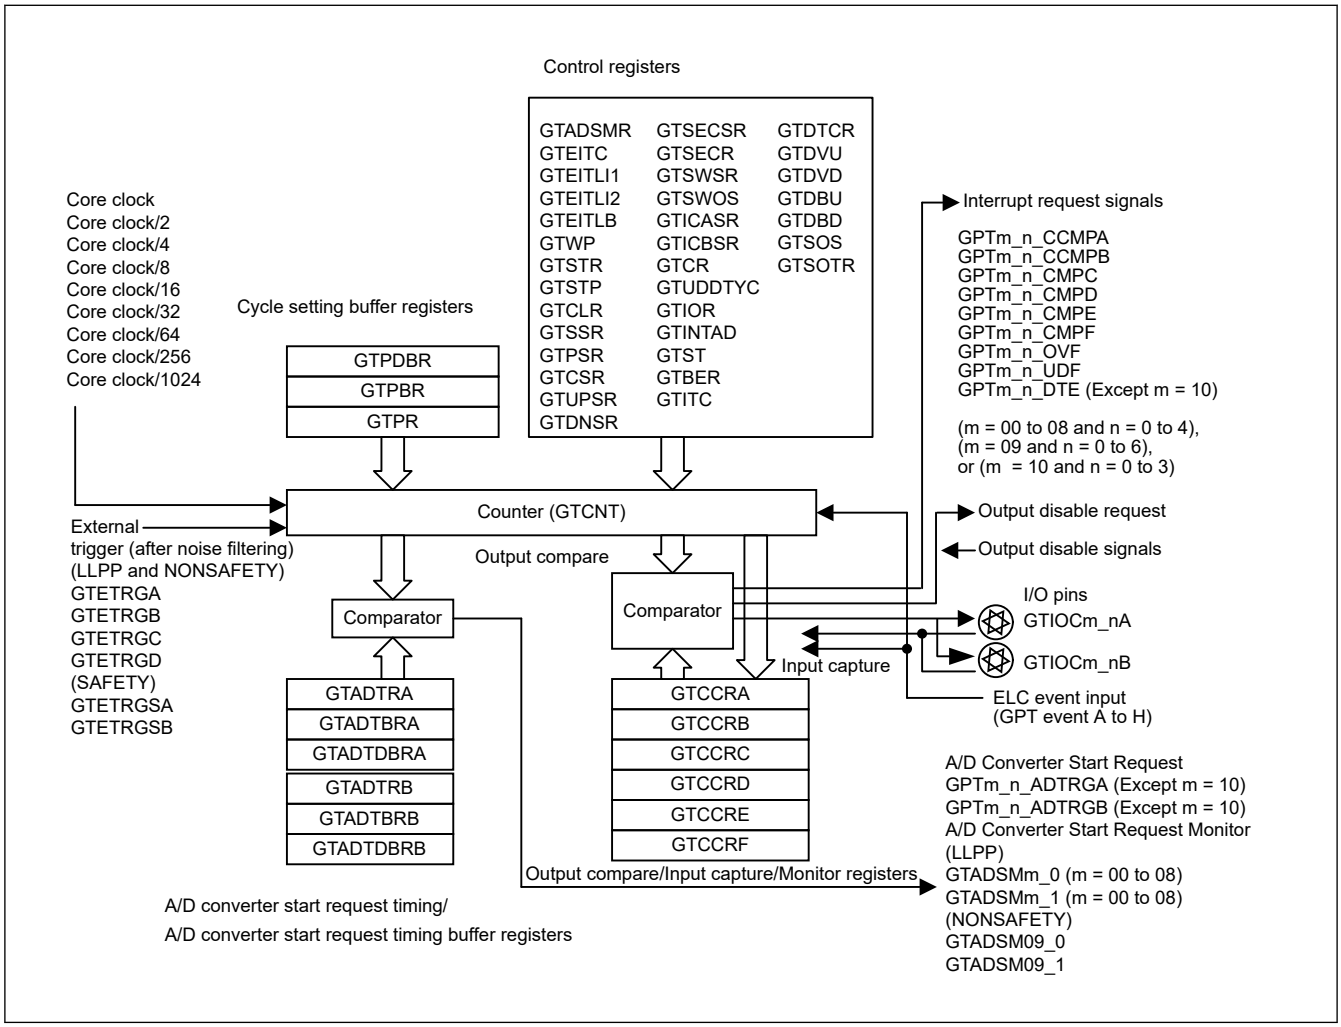

Figure 20.1 GPT block diagram (1 channel)

Table 20.2 GPT I/O pins (1 of 2)

Channel	Pin name	I/O	Function
Shared (LLPP and NONSAFETY)	GTETRGA	Input	External trigger input pin A (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGB	Input	External trigger input pin B (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGC	Input	External trigger input pin C (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGD	Input	External trigger input pin D (after noise filtering) for channels in LLPP and NONSAFETY
Shared (SAFETY)	GTETRGSA	Input	External trigger input pin A (after noise filtering) for channels in SAFETY
	GTETRGSB	Input	External trigger input pin B (after noise filtering) for channels in SAFETY

Table 20.2 GPT I/O pins (2 of 2)

Channel	Pin name	I/O	Function
Shared (LLPP (m = 00 to 08))	GTADSMm_0	Output	A/D conversion start request monitor 0 output pin for unit m in LLPP
	GTADSMm_1	Output	A/D conversion start request monitor 1 output pin for unit m in LLPP
Shared (NONSAFETY)	GTADSM09_0	Output	A/D conversion start request monitor 0 output pin for unit 09 in NONSAFETY
	GTADSM09_1	Output	A/D conversion start request monitor 1 output pin for unit 09 in NONSAFETY
GPTm_n (m = 00 to 08, n = 0 to 4) (LLPP)	GTIOCm_nA	I/O	GPTm_n GTCCRA register input capture input/output compare output/PWM output pin
	GTIOCm_nB	I/O	GPTm_n GTCCRB register input capture input/output compare output/PWM output pin
GPT09_n (n = 0 to 6) (NONSAFETY)	GTIOC09_nA	I/O	GPT09_n GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC09_nB	I/O	GPT09_n GTCCRB register input capture input/output compare output/PWM output pin
GPT10_n (n = 0 to 3) (SAFETY)	GTIOC10_nA	I/O	GPT10_n GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC10_nB	I/O	GPT10_n GTCCRB register input capture input/output compare output/PWM output pin

Note: External triggers are available through POEG.

Table 20.3 GPT interrupt sources

Name	Interrupt sources
GPTm_n_CCMPA	GTCCRA input capture / compare match
GPTm_n_CCMPB	GTCCRB input capture / compare match
GPTm_n_CMPC	GTCCRC compare match
GPTm_n_CMPD	GTCCRD compare match
GPTm_n_CMPE	GTCCRE compare match
GPTm_n_CMPF	GTCCRF compare match
GPTm_n_OVF	GTCNT overflow (GTPR compare match)
GPTm_n_UDF	GTCNT underflow
GPTm_n_DTE*2	Dead time error
GPTm_n_ADTRGA*1 *2	GTADTRA compare match (A/D Converter Start Request A)
GPTm_n_ADTRGB*1 *2	GTADTRB compare match (A/D Converter Start Request B)

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3).
Note 1. A/D converter start requests are only used for ELC.
Note 2. Except m = 10 (Unit 10, SAFETY)

20.2 Register Map

Table 20.4 GPT register map (1 of 5)

Address	Register symbol	Register name	Write protection
0x9000_2000 + 0x1000 × m + 0x0100 × n (m = 0 to 5, n = 0 to 4) 0x9010_0000 + 0x1000 × (m - 6) + 0x0100 × n (m = 6 to 8, n = 0 to 4) 0x8000_0000 + 0x0100 × n (n = 0 to 6) 0x8100_0000 + 0x0100 × n (n = 0 to 3)	GTWP	General PWM Timer Write-Protection Register	—

20.3 Register Descriptions

20.3.1 GTWP : General PWM Timer Write-Protection Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	CMNWP	CLRWP	STPWP	STRWP	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WP	Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W
1	STRWP	GTSTR.CSTRT Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
2	STPWP	GTSTP.CSTOP Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W

Bit	Symbol	Function	R/W
3	CLRWP	GTCLR.CCLR Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
4	CMNWP	Common Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	GTWP Key Code To modify the WP, STRWP, STPWP, CLRWP, and CMNWP bits, write 0xA5.	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

For detail, see section 20.9.1. Write-Protection for Registers.

20.3.2 GTSTR : General PWM Timer Software Start Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CSTRT0	Channel 0 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
1	CSTRT1	Channel 1 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
2	CSTRT2	Channel 2 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
3	CSTRT3	Channel 3 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
4	CSTRT4*1	Channel 4 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W

Bit	Symbol	Function	R/W
5	CSTRT5*1 *2	Channel 5 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
6	CSTRT6*1 *2	Channel 6 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Not available for unit 10 (SAFETY)
Note 2. Not available for unit 00 to 08 (LLPP0 and LLPP1)

The GTSTR register starts the GTCNT counter operation of each channel in the same unit.

The GTSTR register of each channel is a common register, and writing 1 to the GTSTR register in any channel and updating it can start operation of the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

20.3.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)

Note 1. Not available for unit 10 (SAFETY)
Note 2. Not available for unit 00 to 08 (LLPP0 and LLPP1)

The GTSTP register stops the GTCNT counter operation of each channel in the same unit.

The GTSTP register of each channel is a common register, and writing 1 to the GTSTP register in any channel and updating it can stop operation of the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

20.3.4 GTCLR : General PWM Timer Software Clear Register

Note 1. Not available for unit 10 (SAFETY)
Note 2. Not available for unit 00 to 08 (LLPP0 and LLPP1)

The GTCLR register is a write-only register that sets the clearing of the GTCNT counter of each channel in the same unit. The GTCLR register of each channel is a common register, and writing 1 to the GTCLR register in any channel and updating it can clear the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

Table 20.6 Settings of GTIOA[4:0] bits, GTIOB[4:0] bits

GTIOA/GTIOB bits					Function		
[4]	[3]	[2]	[1]	[0]	bit [4]	bits [3:2]	bits [1:0]
0	0	0	0	0	Initial output is low	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	0	0	0	Initial output is high	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note:
- In sawtooth-wave mode, "end of a cycle" refers to an overflow (the value of the GTCNT counter changing from that of the GTPR register to 0x00000000 in up-counting), an underflow (the value of the GTCNT counter changing from 0x00000000 to that of the GTPR register in down-counting), or counter clearing. It refers to a trough in triangle-wave mode (the value of the GTCNT counter changing from 0x00000000 to 0x00000001).
- When the timing of an end of a cycle and the timing of a GTCCRA/GTCCRB register compare match are the same in a compare-match operation, the bit 3 and bit 2 settings are given priority in sawtooth-wave PWM mode, and the bit 1 and bit 0 settings are given priority in any other mode.
- During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), bit 3 and bit 2 settings become invalid.

20.3.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x38

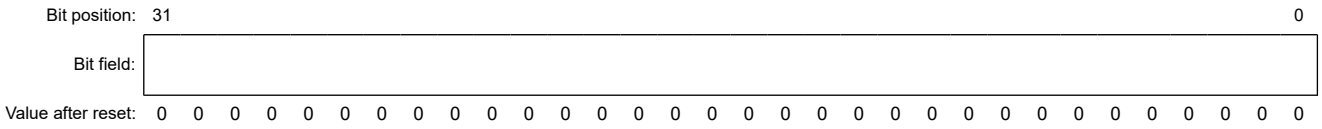
20.3.19 GTCNT : General PWM Timer Counter

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x48

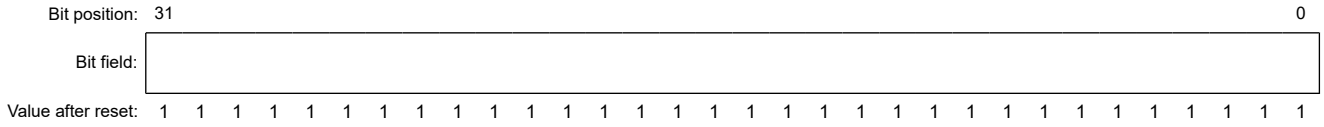


Bit	Symbol	Function	R/W
31:0	n/a	The GTCNT counter is a 32-bit readable/writable counter. There is one GTCNT counter for each channel. Writing is available only when counting is stopped, and thus writing is disabled while counting is in progress (when CST = 1). Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units. Set the range of the GTCNT counter within the range of 0 ≤ GTCNT counter ≤ GTPR register.	R/W

20.3.20 GTCCRm : General PWM Timer Compare Capture Register m (m = A to F)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x4C (GTCCRA), 0x50 (GTCCRB), 0x54 (GTCCRC)
0x58 (GTCCRE), 0x5C (GTCCRD), 0x60 (GTCCRF)

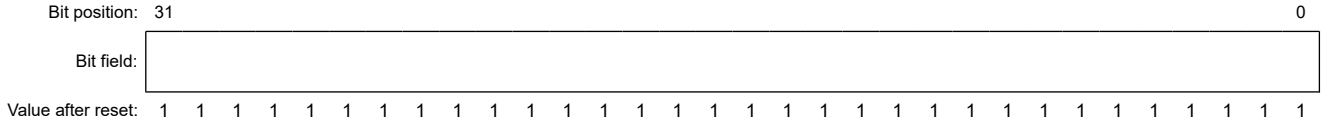


Bit	Symbol	Function	R/W
31:0	n/a	The GTCCRm register is a 32-bit readable/writable register. Access in 8-bit or 16-bit units to the GTCCRm register is prohibited, and it should be accessed in 32-bit units. The GTCCRA and GTCCRB registers are used for both output compare and input capture. The GTCCRC and GTCCRE registers are compare match registers, and can also function as buffer registers for the GTCCRA and GTCCRB registers. The GTCCRD and GTCCRF registers are compare match registers, and can also function as buffer registers for the GTCCRC and GTCCRE registers (double buffer registers for the GTCCRA and GTCCRB registers).	R/W

20.3.21 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x64

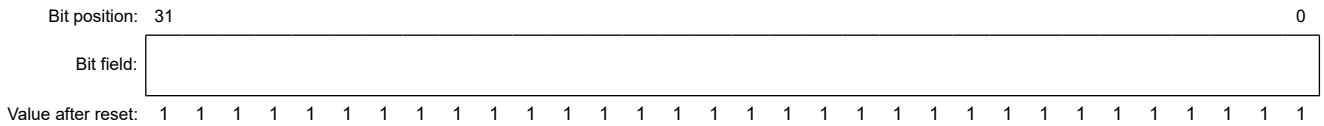


Bit	Symbol	Function	R/W
31:0	n/a	The GTPR register is a 32-bit readable/writable register that sets the maximum count value of the GTCNT counter. Access in 8-bit or 16-bit units to the GTPR register is prohibited, and it should be accessed in 32-bit units. In sawtooth-wave mode, the value of (GTPR register + 1) is the count period. In triangle-wave mode, the value of (GTPR register value × 2) is the count period.	R/W

20.3.22 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x68



Bit	Symbol	Function	R/W
31:0	n/a	The GTPBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPR register. Access in 8-bit or 16-bit units to the GTPBR register is prohibited, and it should be accessed in 32-bit units.	R/W

20.3.23 GTPDBR : General PWM Timer Cycle Setting Double-Buffer Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x6C

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTPDBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPBR register (a double buffer register for the GTPR register). Access in 8-bit or 16-bit units to the GTPDBR register is prohibited, and it should be accessed in 32-bit units.	R/W

20.3.24 GTADTRm : A/D Converter Start Request Timing Register m (m = A, B)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)

Offset address: 0x70 (GTADTRA)
0x7C (GTADTRB)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTADTRm register is a 32-bit readable/writable register that sets the timing of A/D converter start request generation. Access in 8-bit or 16-bit units to the GTADTRm register is prohibited, and it should be accessed in 32-bit units. When the GTADTRm register value matches the GTCNT counter value, an A/D converter start request is generated.	R/W

Unit 10 (SAFETY) does not support A/D converter start request.

20.3.25 GTADTBRm : A/D Converter Start Request Timing Buffer Register m (m = A, B)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)

Offset address: 0x74 (GTADTBRA)
0x80 (GTADTBRB)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

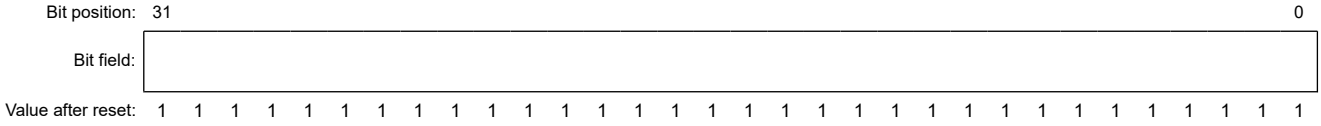
Bit	Symbol	Function	R/W
31:0	n/a	The GTADTBRm register is a 32-bit readable/writable register that functions as buffer register for the GTADTRm register. Access in 8-bit or 16-bit units to the GTADTBRm register is prohibited, and it should be accessed in 32-bit units.	R/W

Unit 10 (SAFETY) does not support A/D converter start request.

20.3.26 GTADTDBRm : A/D Converter Start Request Timing Double-Buffer Register m (m = A, B)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)

Offset address: 0x78 (GTADTDBRA)
0x84 (GTADTDBRB)



Bit	Symbol	Function	R/W
31:0	n/a	The GTADTDBRm register is a 32-bit readable/writable register that functions as a buffer register for the GTADTBRm register (double buffer register for the GTADTRm register). Access in 8-bit or 16-bit units to the GTADTDBRm register is prohibited, and it should be accessed in 32-bit units.	R/W

Unit 10 (SAFETY) does not support A/D converter start request.

20.3.27 GTDTCR : General PWM Timer Dead Time Control Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TDE	Negative-Phase Waveform Setting 0: GTCCRB register is set without using GTDVU and GTDVD registers 1: GTDVU and GTDVD registers are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB register	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	TDBUE	GTDVU Register Buffer Operation Enable 0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled	R/W

Bit	Symbol	Function	R/W
5	TDBDE	GTDVD Register Buffer Operation Enable 0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	TDFER	GTDVD Register Setting 0: GTDVU and GTDVD registers are set separately 1: The value written to GTDVU register is automatically set to GTDVD register	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The GTDTCR register enables automatic setting of a compare match value for negative-phase waveform with dead time. This register is invalid during the event count operation.

20.3.28 GTDVm : General PWM Timer Dead Time Value Register m (m = U, D)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x8C (GTDVU)
0x90 (GTDVD)

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTDVm register is a 32-bit readable/writable register that sets the dead time for generating PWM waveforms with dead time. Access in 8-bit or 16-bit units to the GTDVm register is prohibited, and it should be accessed in 32-bit units. The GTDVU register is used for up-counting. The GTDVD register is used for down-counting. The setting which the value for the GTDVm register is equal to or larger than the value for the GTPR register is prohibited. In addition, when using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When using the GTDVm register, writing to the GTCCRB register is prohibited. When setting this register to 0, waveforms without dead time are output. When the GTDTCR.TDFER bit is 1, the writing to the GTDVD register has no effect. At this time, when the GTDVD register is read, the value for the GTDVU register is read.	R/W

20.3.29 GTDBm : General PWM Timer Dead Time Value Buffer Register m (m = U, D)

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x94 (GTDBU)
0x98 (GTDBD)

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTDBm register is a 32-bit readable/writable register that functions as a buffer register for the GTDVm register. Access in 8-bit or 16-bit units to the GTDBm register is prohibited, and it should be accessed in 32-bit units.	R/W

20.3.30 GTSOS : General PWM Timer Output Protection Function Status Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0x9C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

31	—	This bit is read as 0. The write value should be 0.	R/W

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow, and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 20.7 Setting the function select for the GTEITLI1 register

EITLy[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0. An interrupt is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0. An interrupt is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0. An interrupt is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. An interrupt is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. An interrupt is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. An interrupt is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- y = A, B, C, D, E, F, V, U; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EITLy[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

20.3.35 GTEITLI2 : General PWM Timer Extended Interrupt Skipping Setting Register 2

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0xB0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	EADTBL[2:0]			—	EADTAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	EADTAL[2:0]	GTADTRA A/D Converter Start Request Extended Skipping Function Select See Table 20.8.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	EADTBL[2:0]	GTADTRB A/D Converter Start Request Extended Skipping Function Select See Table 20.8.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The GTEITLI2 register sets the extended skipping function for A/D converter start requests.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 20.8 Setting the function select for the GTEITLI2 register

EADTmL[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 is other than 0. An A/D converter start request is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 2 is other than 0. An A/D converter start request is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0. An A/D converter start request is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. An A/D converter start request is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. An A/D converter start request is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. An A/D converter start request is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- m = A, B; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EADTmL[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

20.3.36 GTEITLB : General PWM Timer Extended Buffer Transfer Skipping Setting Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0xB4

27	—	This bit is read as 0. The write value should be 0.	R/W
30:28	EBTLDVD[2:0]	GTDVD Register Buffer Transfer Extended Skipping Function Select See Table 20.9.	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The GTEITLB register sets the extended skipping function for buffer transfers.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 20.9 Setting the function select for the GTEITLB register

EBTLx[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0. A buffer transfer is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0. A buffer transfer is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0. A buffer transfer is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. A buffer transfer is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. A buffer transfer is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. A buffer transfer is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- x = CA, CB, PR, ADA, ADB, DVU, DVD; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EBTLx[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

20.3.37 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Note 1. Not available for unit 10 (SAFETY)
Note 2. Not available for unit 00 to 08 (LLPP0 and LLPP1)

The GTSECSR register selects an intended channel for updating an operation enable bit by the GTSECR register.

A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

20.3.38 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0xD4

11	SBDDD	GTDV Register Buffer Operation Simultaneous Disable 0: Disable simultaneous disabling GTDV buffer operations 1: Disable GTDV register buffer operations simultaneously	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers. It is reflected in the GTBER.BDn (n = 0 to 3) bits of simultaneous channels. Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

20.3.39 GTSWSR : General PWM Timer Switch Source Select Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0xD8

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Not available for unit 10 (SAFETY)
Note 2. Not available for unit 00 to unit 08 (LLPP0 and LLPP1)

The GTSWSR register sets a counter switch source for the GTCNT counter. Count switch can be executed whether the counter is running (GTCR.CST = 1) or stopped (GTCR.CST = 0). Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD, (GTETRGSA and GTETRGSB for SAFETY) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

20.3.40 GTSWOS : General PWM Timer Switch Offset Setting Register

Base address: GPT0h_i = 0x9000_2000 + 0x1000 × h + 0x0100 × i (h = 0 to 5, i = 0 to 4)
GPT0j_k = 0x9010_0000 + 0x1000 × (j - 6) + 0x0100 × k (j = 6 to 8, k = 0 to 4)
GPT09_h = 0x8000_0000 + 0x0100 × h (h = 0 to 6)
GPT10_y = 0x8100_0000 + 0x0100 × y (y = 0 to 3)

Offset address: 0xDC

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTSWOS register is a readable/writable register that sets the offset value of GTCNT counter which is reloaded by count switch operation. Access in 8-bit or 16-bit units to the GTSWOS register is prohibited, and it should be accessed in 32-bit units. The GTSWOS register is writable even while the GTCNT counter operation. If the GTSWOS register writing and the event input of count switch occur at the same time, the GTSWOS register setting before writing is reloaded to GTCNT counter. Write the GTSWOS register earlier than the event input of count switch to ensure that the written GTSWOS register value is reloaded by the count switch operation.

20.3.41 GTIOCSEL : General PWM Timer Input Capture Signal Select Register

Base address: GPT_IC = 0x8029_0000

Offset address: 0x0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

7	GT07_ISEL	Input Capture Signal Select for GPT07_4 channel 0: GTIOC07_4A / GTIOC07_4B input signals are selected 1: GTIOC07_3A / GTIOC07_3B input signals are selected	R/W
8	GT08_ISEL	Input Capture Signal Select for GPT08_4 channel 0: GTIOC08_4A / GTIOC08_4B input signals are selected 1: GTIOC08_3A / GTIOC08_3B input signals are selected	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The GTIOCSEL register specifies input capture signals for channel 4 of GPTm units (m = 00 to 08).

20.4 Operation

20.4.1 Basic Operation

The timer in each channel performs periodic count operation by count clock or hardware source. The GTCNT counter performs up-counting, or down-counting. The timer period is controlled by the GTPR register. When the GTCNT counter value matches the values for GTCCRA or GTCCRB register, the GTIOCm_nA or GTIOCm_nB pin outputs ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) can be changed respectively. Also, the GTCCRA or GTCCRB register can be used as the input capture register by hardware source. The GTCCRC and GTCCRD registers can be performed as buffer registers for GTCCRA register, and the GTCCRE and GTCCRF registers can be performed as buffer registers for GTCCRB register.

20.4.1.1 Counter Operation

(1) Count Start/Count Stop

The counter in each channel starts counting operation when the corresponding GTCR.CST bit is set to 1, and stops counting when the bit is set to 0.

CST bit value can be changed by the following sources:

- Writing to the GTCR register
- Writing 1 to the bit corresponding to the channel number for the GTSTR register while the GTSSR.CSTRT bit is 1
- Writing 1 to the bit corresponding to the channel number for the GTSTP register while the GTPSR.CSTOP bit is 1
- Hardware source specified by the GTSSR register
- Hardware source specified by the GTPSR register

(2) Periodic Count Operation (In Up-Counting by the Count Clock)

The counter in each channel starts up-counting when the corresponding CST bit is set to 1 while the GTUPSR register and the GTDNSR register are 0x00000000. When the value of the GTCNT counter changes from that of the GTPR register

to 0x00000000 (an overflow) while the GTINTAD.GTINTPR[0] bit is 1, a GPTm_n_OVF interrupt request is also issued. After GTCNT counter overflows, up-counting is resumed from 0x00000000.

Figure 20.2 shows an example of periodic count operation in up-counting by count clock.

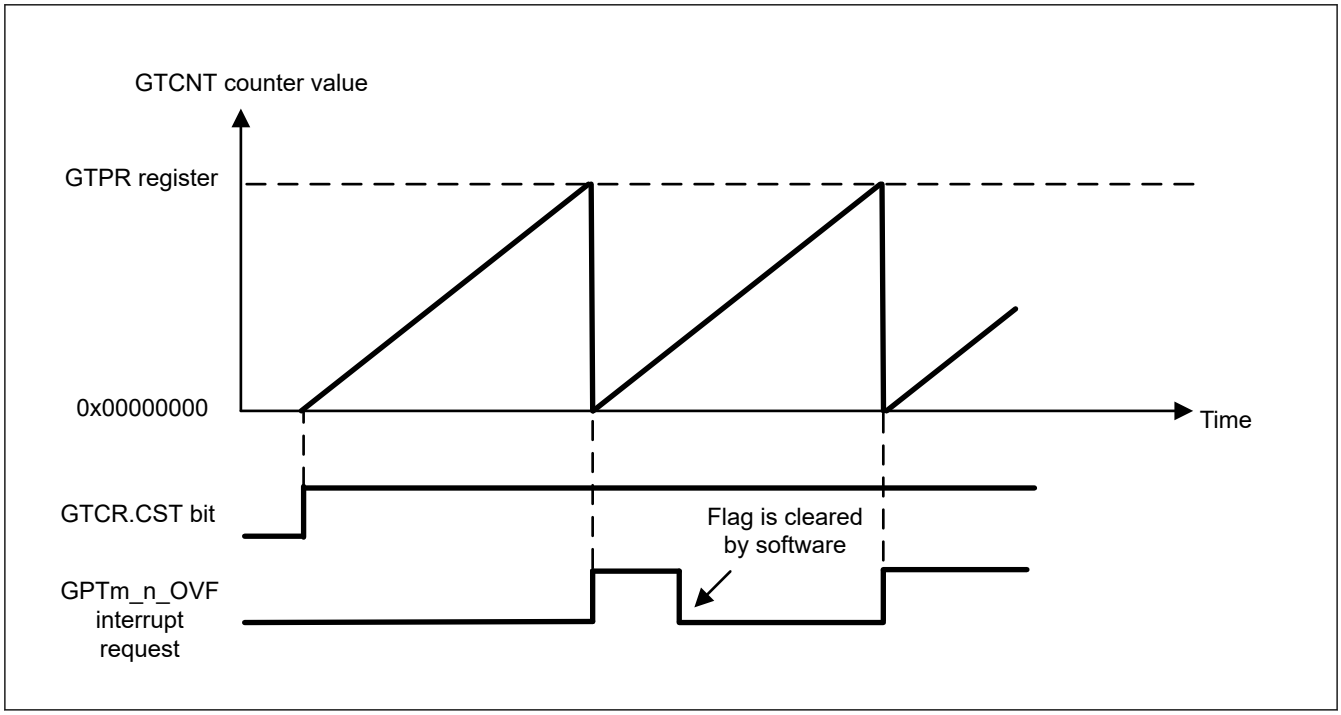

Figure 20.2 Example of periodic count operation (in up-counting by the count clock)

The following example shows the setting for periodic count operation in up-counting by count clock.

1. Set operating mode
   Set the operating mode with GTCR.MD[2:0] bits. In Figure 20.2, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction with the GTUDDTYC register. In Figure 20.2, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter. In Figure 20.2, 0x00000000 is set.
6. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(3) Periodic Count Operation (In Down-Counting by the Count Clock)

The counter in each channel can start down-counting when the corresponding GTUDDTYC.UD bit is set in a state of the GTUPSR register and the GTDNSR register as 0x00000000. When the value of the GTCNT counter changes from 0x00000000 to that of the GTPR register (an underflow) while the GTINTAD.GTINTPR[1] bit is 1, a GPTm_n_UDF interrupt request is also issued. After GTCNT counter underflows, down-counting is resumed from GTPR register value.

Figure 20.3 shows an example of periodic count operation in down-counting by count clock.

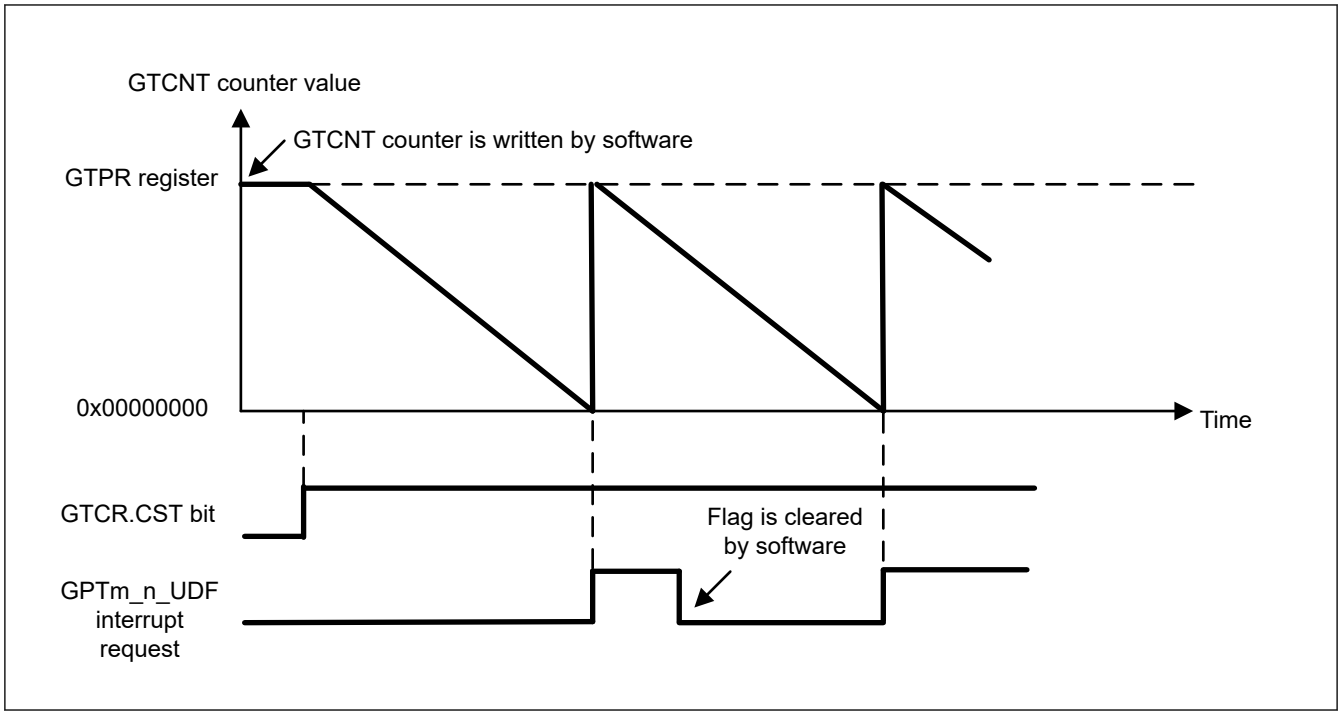

Figure 20.3 Example of periodic count operation (in down-counting by the count clock)

The following example shows the setting for periodic count operation in down-counting by count clock.

1. Set operating mode
   Set the operating mode with GTCR.MD[2:0] bits. In Figure 20.3, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction with the GTUDDTYC register. In Figure 20.3, the lower 2 bits of the GTUDDTYC register is set to 10b and then to 00b for down-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter. In Figure 20.3, the GTPR register value is set.
6. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(4) Event Count Operation (In Up-Counting by Hardware Source)

The counter in each channel can start up-counting by hardware source by setting the GTUPSR register. When the GTUPSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value does not change.

Operation due to overflow in up-counting by hardware source is the same as the periodic count operation by the count clock.

To perform up-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. At the start, the count operation is synchronized with the count clock selected by GTCR.TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start the up-counting operation. To start up-counting after 1 PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY) from setting the CST bit to 1, set the GTCR.TPCS[3:0] bits to 0000b.

Figure 20.4 shows an example of up-counting operation by hardware source.

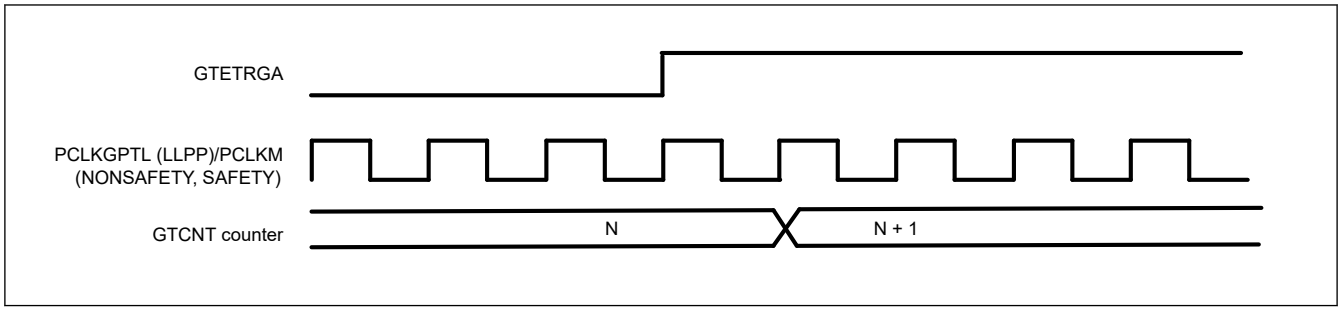

Figure 20.4 Example of event count operation (up-counting of rising edges of the input on the GTETRGA pin)

The following example shows the setting for event count operation in up-counting by a hardware source.

1. Set count-up source
   Select the count-up source with the GTUPSR register.
2. Period setting
   Set a period in the GTPR register.
3. Set initial value for counter
   Set the initial value in the GTCNT counter.
4. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(5) Event Count Operation (In Down-Counting by Hardware Source)

The counter in each channel can start down-counting by hardware source by setting the GTDNSR register. When the GTDNSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value does not change.

Operation due to underflow in down-counting by hardware source is the same as the periodic count operation by the count clock.

To perform down-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. At the start, the count operation is synchronized with the count clock selected by GTCR.TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start down-counting operation. To start down-counting after 1 PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY) from setting the CST bit to 1, set the GTCR.TPCS[3:0] bits to 0000b.

Figure 20.5 shows an example of down-counting operation by hardware source.

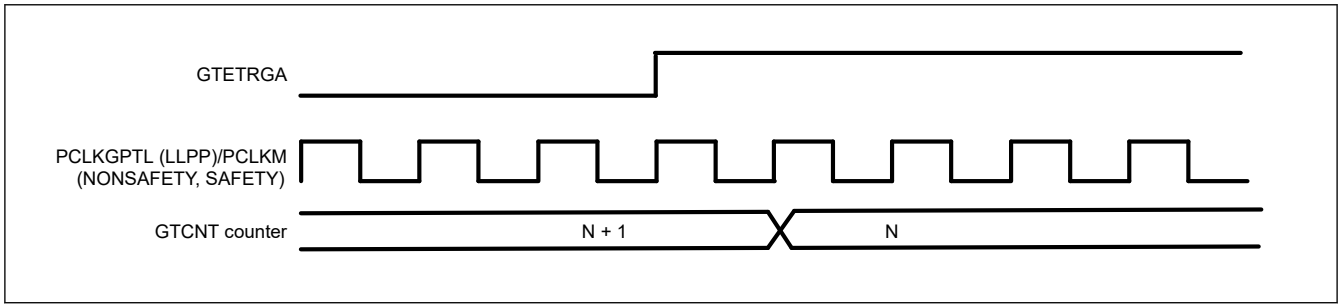

Figure 20.5 Example of event count operation (down-counting of rising edges of the input on the GTETRGA pin)

The following example shows the setting for event count operation in down-counting by hardware source.

1. Set count-down source
   Select the count-down source with the GTDNSR register.
2. Period setting
   Set a period in the GTPR register.
3. Set initial value for counter
   Set the initial value in the GTCNT counter.

4. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(6) Counter Clearing Operation

The counter in each channel can be cleared by the following sources:

- Writing to the GTCNT counter
- Writing 1 to the bit corresponding to the channel number for the GTCLR register while the GTCSR.CCLR bit is 1
- Hardware source specified by the GTCSR register

Write access during counting (when CST = 1) is disabled.

GTCLR register can be written to and cleared by hardware source whether the count operation is performed (GTCR.CST bit = 1) or is stopped (CST bit = 0). When the count direction flag is set as decrement (GTST.TUCF flag = 0) in sawtooth-wave mode selected with GTCR.MD[2:0] bits, the GTCNT counter value for writing to the GTCLR register and for clearing by hardware source becomes the GTPR register value whether the counter is in operation or is stopped. The GTCNT counter value becomes 0x00000000 for other settings.

When the event count operation is set (at least one of the bits for the GTUPSR or the GTDNSR register is set as 1), writing to the GTCLR register and clearing by hardware source are performed right after the clear source is generated (the operation is based on PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY)). For other settings, clearing operation is synchronized with the count clock selected with the GTCR.TPCS[3:0] bits.

20.4.1.2 Waveform Output by Compare Match Counter Operation

Compare match refers to when the GTCNT counter value matches the GTCCRA or GTCCRB register value. The output of the corresponding GTIOCm_nA or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) can be set to be driven low, high, or toggled in synchronization with the counter clock (including in the case of event counting) after the match.

In addition, the GTIOCm_nA or GTIOCm_nB pin output can be driven low, high, or toggled at the "end of the cycle" which is determined by the GTPR register. The end of the cycle is as follows:

- For sawtooth waves in up-counting: When the GTCNT counter value changes from the GTPR register value to 0x00000000 (overflow)
- For sawtooth waves in down-counting: When the GTCNT counter value changes from 0x00000000 to the GTPR register value (underflow)
- For sawtooth waves with the GTCNT counter clear
- For triangle waves: When the GTCNT counter value changes from 0x00000000 to 0x00000001 (trough)

(1) Low Output and High Output

Figure 20.6 shows an example of low output and high output operation by a compare match of the GTCNT counter and GTCCRA register, and of the GTCNT counter and GTCCRB register.

In this example, the GPT00_0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC00_0A pin by a GPT00_0.GTCCRA register compare match, and low is output from the GTIOC00_0B pin by a GPT00_0.GTCCRB register compare match. The pin level does not change when the specified level and pin level match.

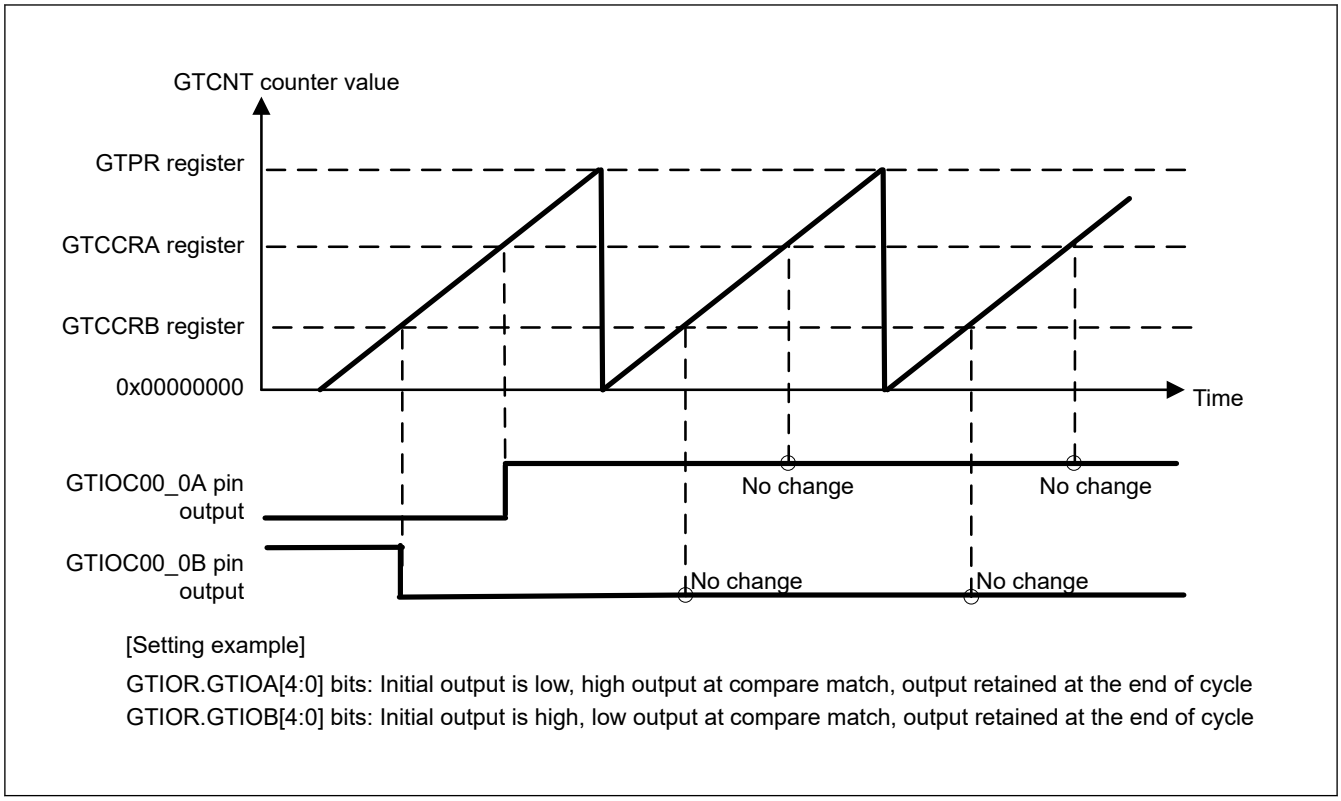

Figure 20.6 Example of low output and high output operation pin

The following example shows the setting for low/high output operation.

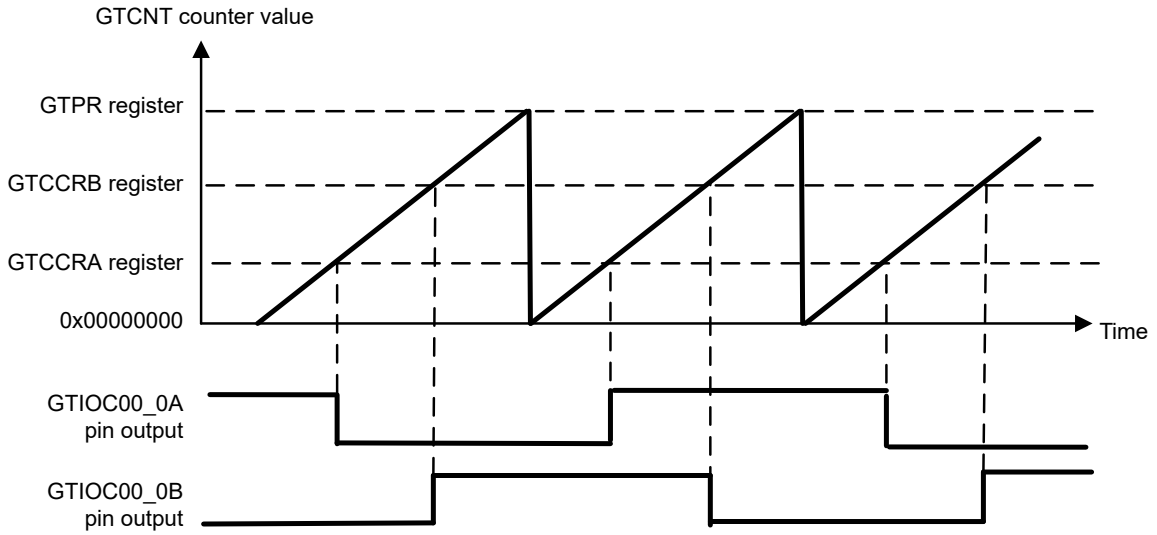
1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits. In Figure 20.6, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.6, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.6, GTIOA[4:0] bits = 00010b and GTIOB[4:0] bits = 10001b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set compare match value
   Set compare match values in the GTCCRA and GTCCRB registers.
9. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

(2) Toggled Output

Figure 20.7 and Figure 20.8 show examples of toggle output operations by compare match between the GPT00_0.GTCNT counter and the GTCCRA and GTCCRB registers.

In Figure 20.7, the GPT00_0.GTCNT counter performs up-counting. Settings are made so that the GTIOC00_0A pin output by a GPT00_0.GTCCRA register compare match and GTIOC00_0B pin output by a GPT00_0.GTCCRB register compare match are toggled.

In Figure 20.8, the GPT00_0.GTCNT counter performs up-counting. Settings are made so that the GTIOC00_0A pin output is toggled by a compare match of GPT00_0.GTCCRA register and the GTIOC00_0B pin output is toggled at the end of the cycle.



[Setting example]

GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at the end of cycle

GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at the end of cycle

Figure 20.7 Example of toggled output operation (1)

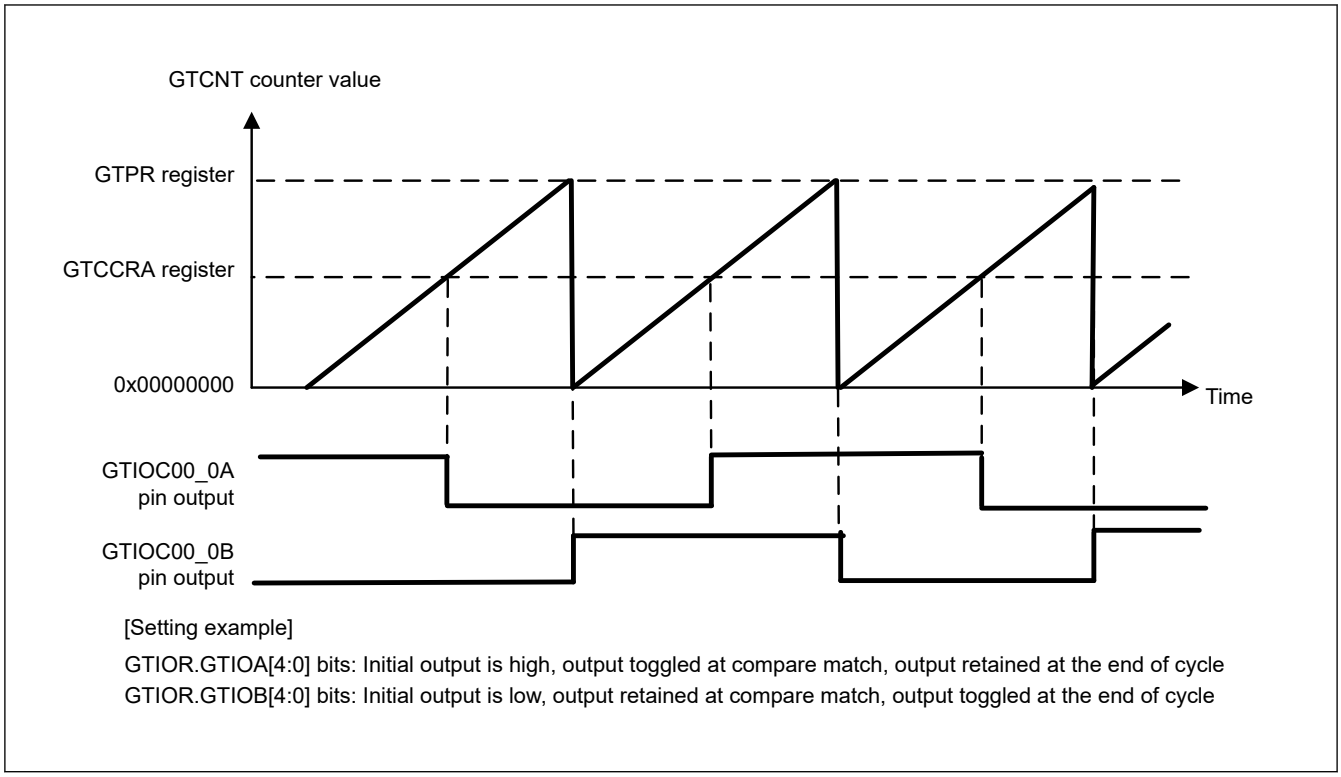


Figure 20.8 Example of toggled output operation (2)

The following example shows the setting for toggled output operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.7 and Figure 20.8, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.7 and Figure 20.8, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.7, GTIOA[4:0] bits = 10011b and GTIOB[4:0] bits = 00011b.
   In Figure 20.8, GTIOA[4:0] bits = 10011b and GTIOB[4:0] bits = 01100b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set compare match value
   Set compare match values in the GTCCRA and GTCCRB registers.
9. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

20.4.1.3 Input Capture Function

Through detecting hardware sources selected by the GTICASR and GTICBSR registers, the GTCNT counter values can be transferred to the GTCCRA and GTCCRB registers, respectively.

Figure 20.9 shows an example of input capture function operation.

In this example, the GPT00_0.GTCNT counter performs up-counting by count clock, and settings are made so that an input capture is performed at both edges of the GTIOC00_0A pin input in the GTCCRA register and at the rising edge of the GTIOC00_0B pin input in the GTCCRB register.

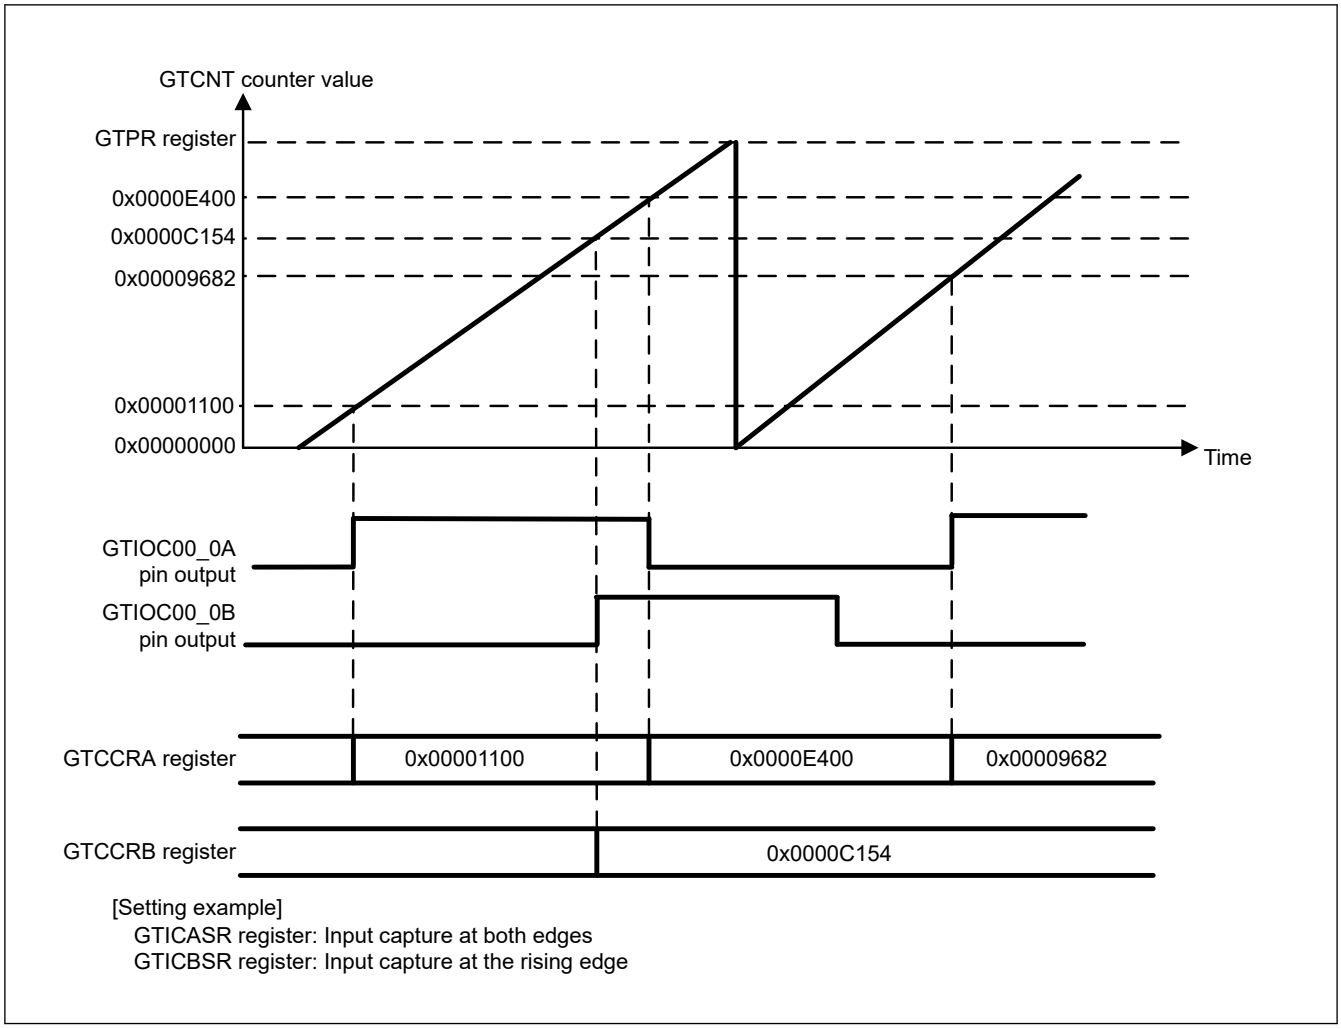

Figure 20.9 Example of input capture operation

The following example shows the setting for input capture operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.9, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register. In Figure 20.9, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Select input capture source
   Select the input capture sources with the GTICASR and GTICBSR registers.
   In Figure 20.9, GTICASR = 0x00000F00 and GTICBSR = 0x00003000.

7. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

20.4.2 Buffer Operation

The following buffer operations can be set with the GTBER register:

- With the GTPR, GTPBR, and GTPDBR registers used together
- With the GTCCRA, GTCCRC, and GTCCRD registers used together
- With the GTCCRB, GTCCRE, and GTCCRF registers used together
- With the GTADTRA, GTADTBRA, and GTADTDBRA registers used together
- With the GTADTRB, GTADTBRB, and GTADTDBRB registers used together

The following buffer operations can be set with the GTDTCR register:

- With the GTDVU and GTDBU registers used together
- With the GTDVD and GTDBD registers used together

20.4.2.1 GTPR Register Buffer Operation

The GTPBR register can function as a buffer register for the GTPR register, and the GTPDBR register can function as a buffer register for the GTPBR register (double buffer register for the GTPR register).

The buffer transfer is performed at an overflow (in up-counting) or underflow (in down-counting) in sawtooth-wave mode or in event counting, or at a trough in triangle-wave mode.

When in sawtooth-wave mode and in event counting, the buffer transfer is performed even when the counter clearing occurs during the count is in operation.

- Hardware source clearing (clear source selected with bits [23:0] of GTCSR register)
- Clearing by software (when the GTCLR.CCLRn bit is written to 1 while GTCSR.CCLR bit is set to 1) (n = 0 to 17)

To set the GTPR register to function as double buffer, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. For not to function as buffer, set 00b.

Figure 20.10 to Figure 20.12 show examples of the GTPR register buffer operation.

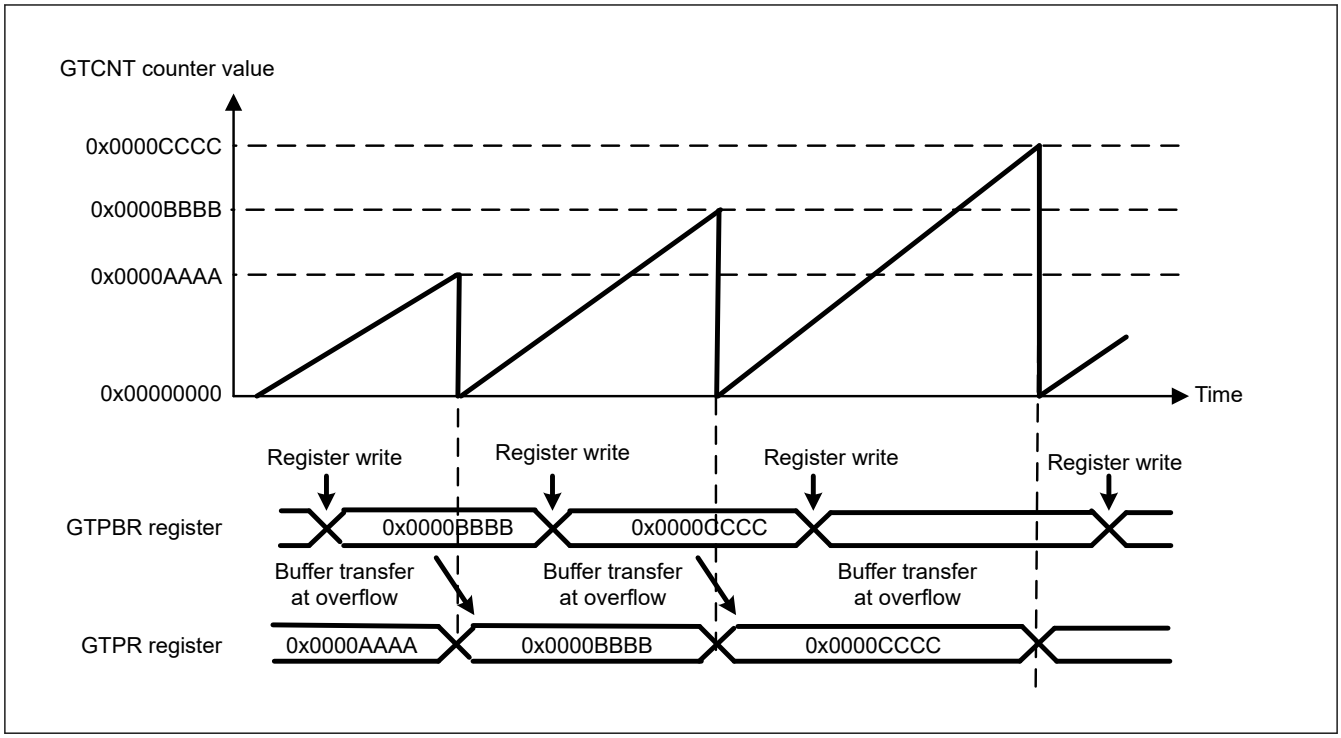

Figure 20.10 Example of the GTPR register buffer operation (sawtooth waves in up-counting)

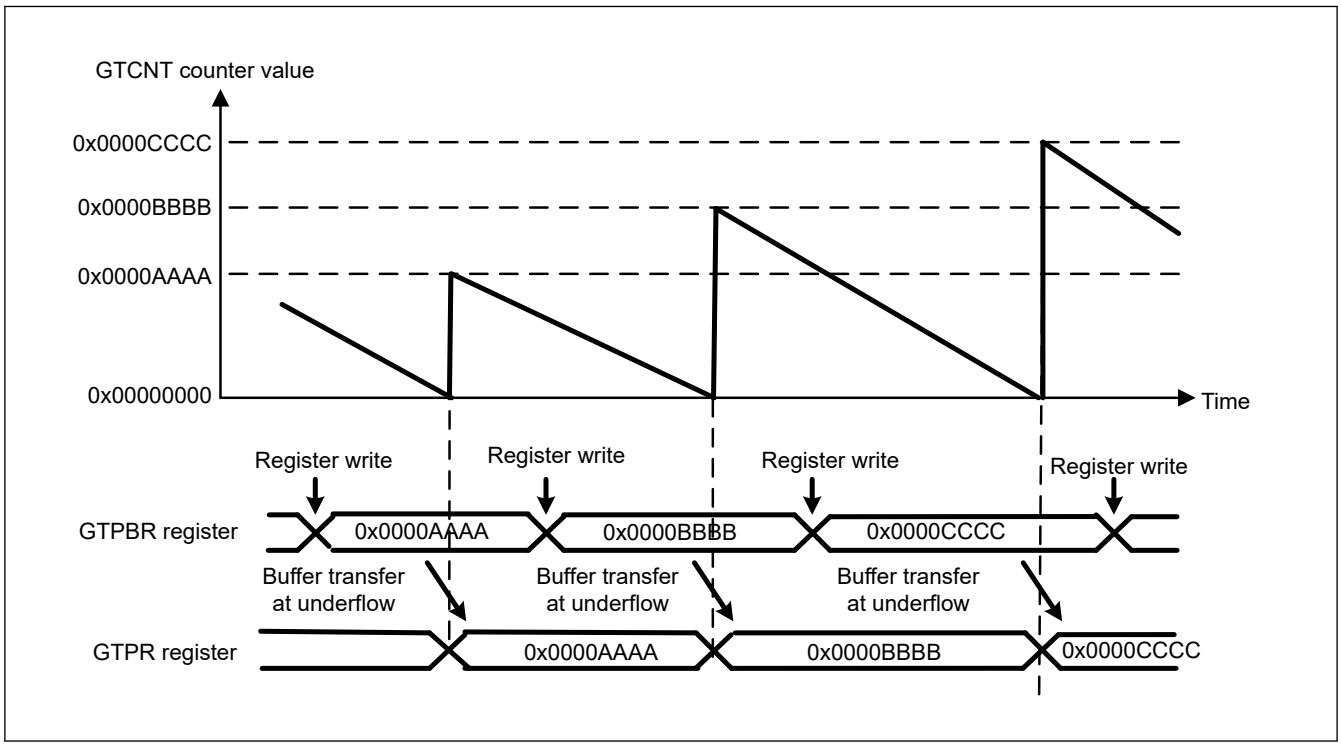

Figure 20.11 Example of the GTPR register buffer operation (sawtooth waves in down-counting)

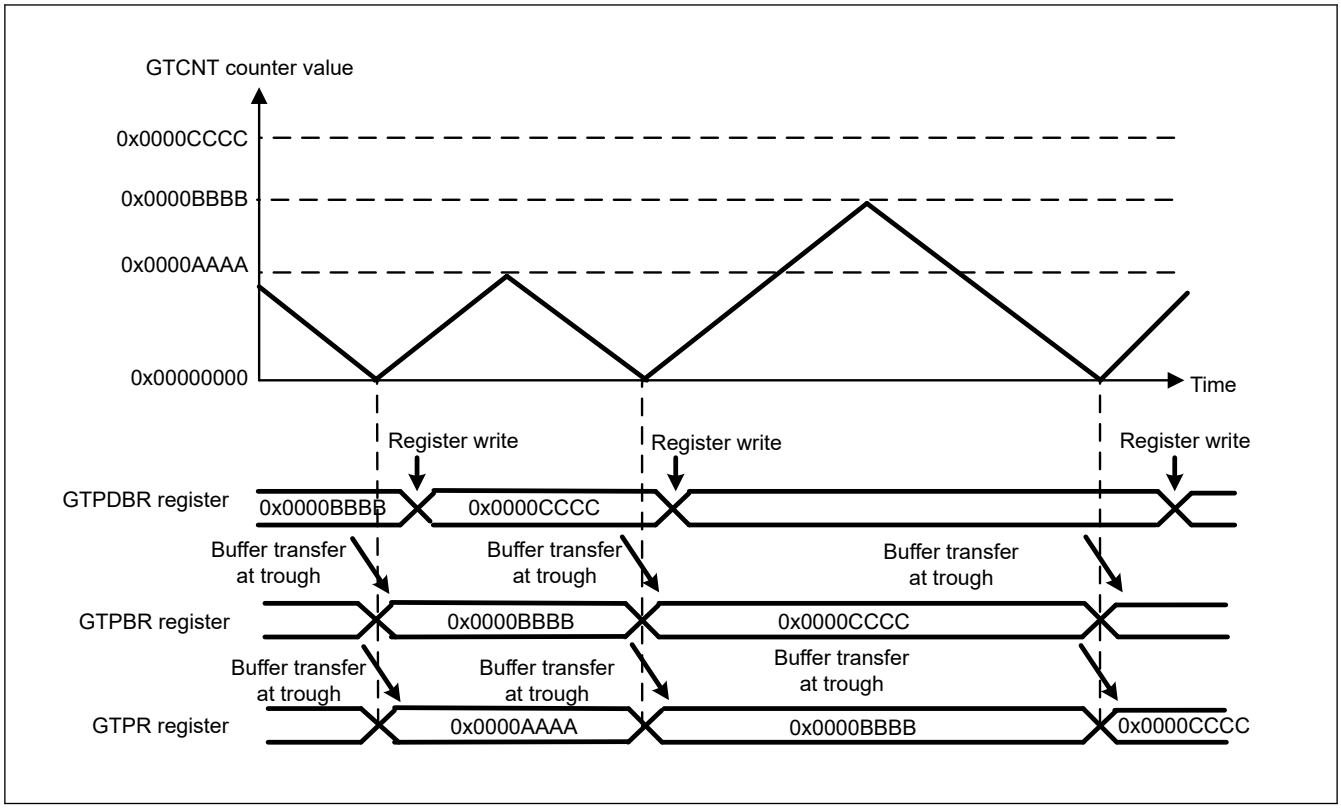

Figure 20.12 Example of the GTPR register double buffer operation (triangle waves)

The following example shows the setting for the GTPR register buffer operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.10 and Figure 20.11, 000b (sawtooth-wave PWM mode) is set, and in Figure 20.12, 100b (triangle-wave PWM mode 1) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register. In Figure 20.10, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting. In Figure 20.11, the lower 2 bits of the GTUDDTYC register is set to 10b and then to 10b for down-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set buffer operation
   Set buffer operation with the GTBER.PR[1:0] bits.
   In Figure 20.10 and Figure 20.11, PR[1:0] bits = 01b. In Figure 20.12, PR[1:0] bits = 1xb.
7. Set buffer value
   For buffer operation, set a period value for the next cycle from the current cycle in the GTPBR register. For double buffer operation, also set a period value for the cycle after the next cycle in the GTPDBR register.
8. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.
9. Set buffer value by cycle
   For buffer operation, set a period value for the next cycle from the current in the GTPBR register. For double buffer operation, set a period value for the cycle after the next cycle in the GTPDBR register.

20.4.2.2 Buffer Operation for the GTCCRA and GTCCRB Registers

The GTCCRC register can function as the GTCCRA buffer register and the GTCCRD register can function as the GTCCRC buffer register (double buffer register for the GTCCRA register). Similarly, the GTCCRE register can function as the GTCCRB buffer register and the GTCCRF register can function as the GTCCRE buffer register (double buffer register for the GTCCRB register).

To set the GTCCRA or GTCCRB register to function as a double buffer, set the GTBER.CCRA[1:0] or GTBER.CCRB[1:0] bits to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.

The following describes buffer operation during output compare and input capture operation.

(1) When the GTCCRA or GTCCRB Register Functions as Output Compare Register

Buffer transfer is performed for the following three cases:

- Buffer transfer at an overflow (in up-counting) and underflow (in down-counting)
  Buffer transfer is performed at an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode and in event counting, and at a trough (triangle-wave PWM mode 1) or at a crest/trough (triangle-wave PWM mode 2) in triangle-wave mode.
- Buffer transfer by counter clearing
  In sawtooth-wave mode and in event counting, the buffer transfer by similar counter clearing sources in counting operation and in section 20.4.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).
  In triangle-wave mode, buffer transfer by counter clearing is not performed.
- Forcible buffer transfer
  In both sawtooth-wave mode and triangle-wave mode, buffer transfer of the GTCCRA and GTCCRB registers is forcibly performed by writing 1 to the GTBER.CCRSWT bit while the counting is stopped.
  In sawtooth-wave one-shot pulse mode and triangle-wave PWM mode 3, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B is also performed using the forcible buffer operation.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRm (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD0 bit or buffer transfer extended skipping function (function for repeated double-buffer operation while buffer transfer is disabled). For details, see section 20.9.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 20.13 to Figure 20.15 show examples of the GTCCRA and GTCCRB registers buffer operations.

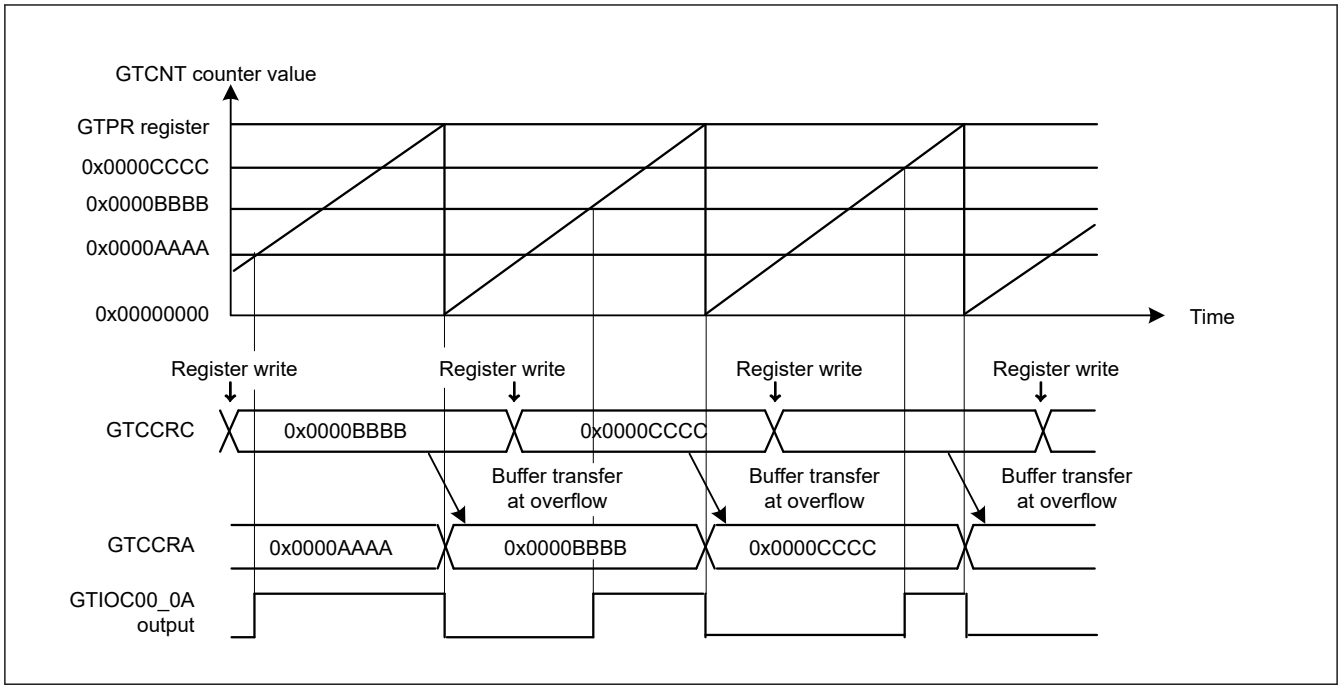

Figure 20.13 Example of GTCCRA and GTCCRB registers buffer operation (output compare, sawtooth waves in up-counting, high output at GTCCRA register compare match, low output at the end of the cycle)

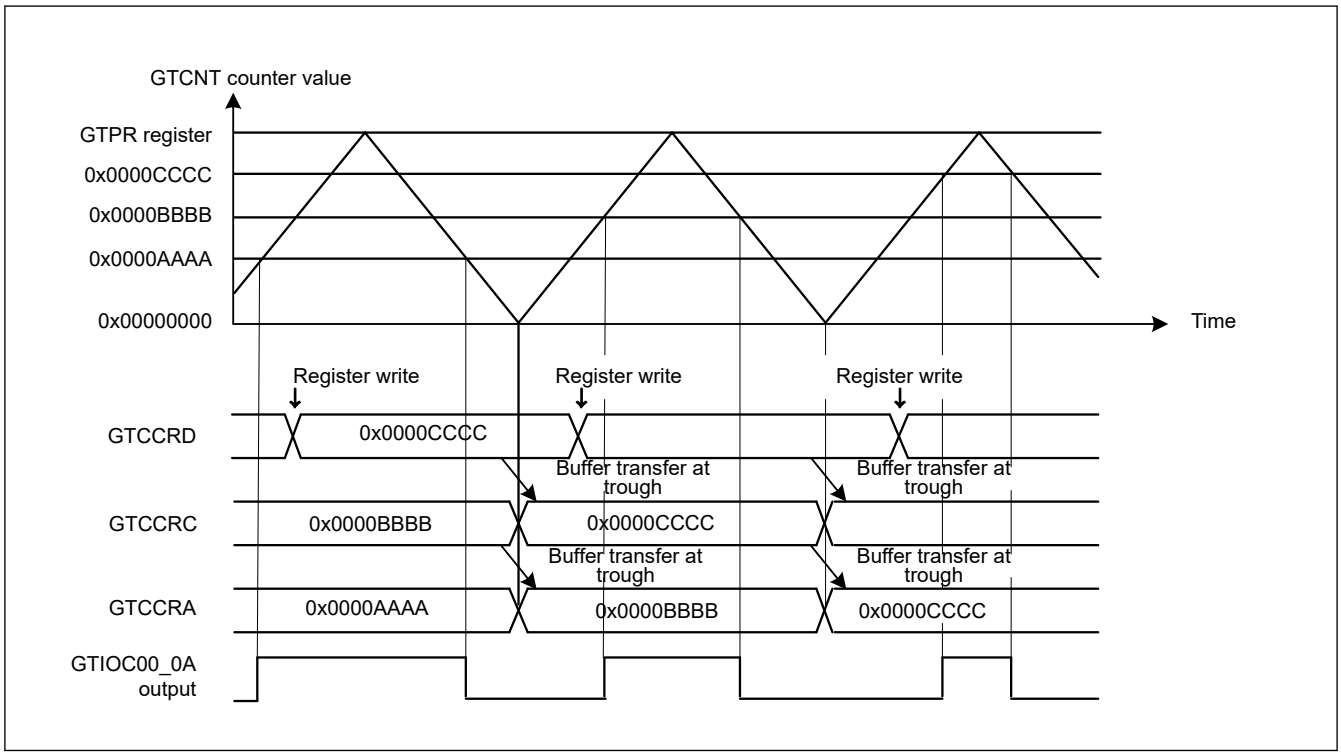

Figure 20.14 Example of GTCCRA and GTCCRB registers double buffer operation (output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA register compare match, output retained at the end of the cycle)

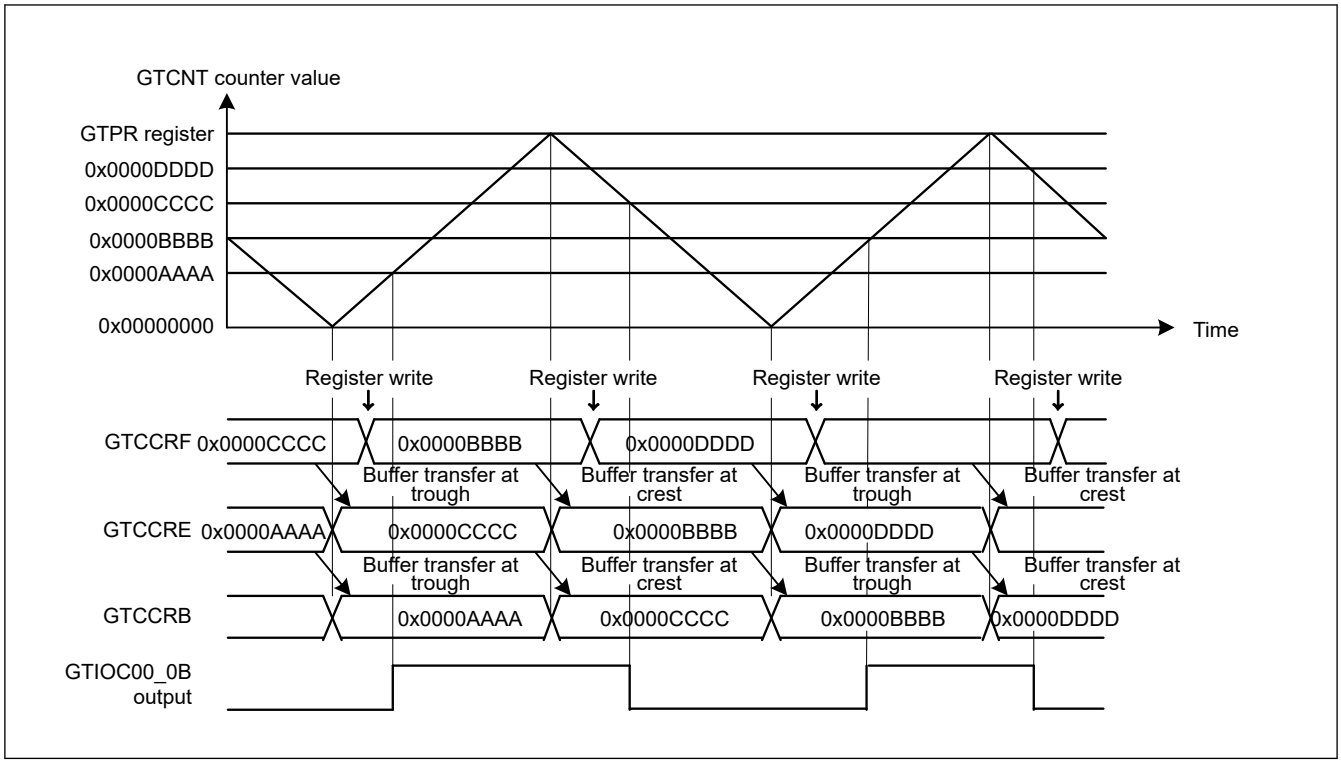

Figure 20.15 Example of GTCCRA and GTCCRB registers double buffer operation (output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB register compare match, output retained at the end of the cycle)

The following example shows setting for buffer operation of the GTCCRA and GTCCRB registers for output compare.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.13, 000b (sawtooth-wave PWM mode) is set, in Figure 20.14, 100b (triangle-wave PWM mode 1) is set, and in Figure 20.15, 101b (triangle-wave PWM mode 2) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.13, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.13, GTIOA[4:0] bits = 00110b, in Figure 20.14, GTIOA[4:0] bits = 00011b, and in Figure 20.15, GTIOB[4:0] bits = 00011b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer operation
   Set buffer operation with the GTBER.CCRA[1:0] bits and CCRB[1:0] bits.
   In Figure 20.13, CCRA[1:0] bits = 01b, in Figure 20.14, CCRA[1:0] bits = 1xb, and in Figure 20.15, CCRB[1:0] bits = 1xb.
9. Set compare match value
   Set the GTIOCm_nA pin changing point in the GTCCRA register and GTIOCm_nB pin changing point in the GTCCRB register.

10. Set buffer value
    For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.
11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value by cycle
    For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle (in sawtooth-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

(2) When the GTCCRA or GTCCRB Register Functions as Input Capture Register

The timing of transfer to the buffers is when an input capture is generated. When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB registers and the stored GTCCRA and GTCCRB registers values are transferred to buffer registers. Buffer transfer by counter clearing is not performed at input capture.

Figure 20.16 and Figure 20.17 show examples of buffer operation of the GTCCRA and GTCCRB registers.

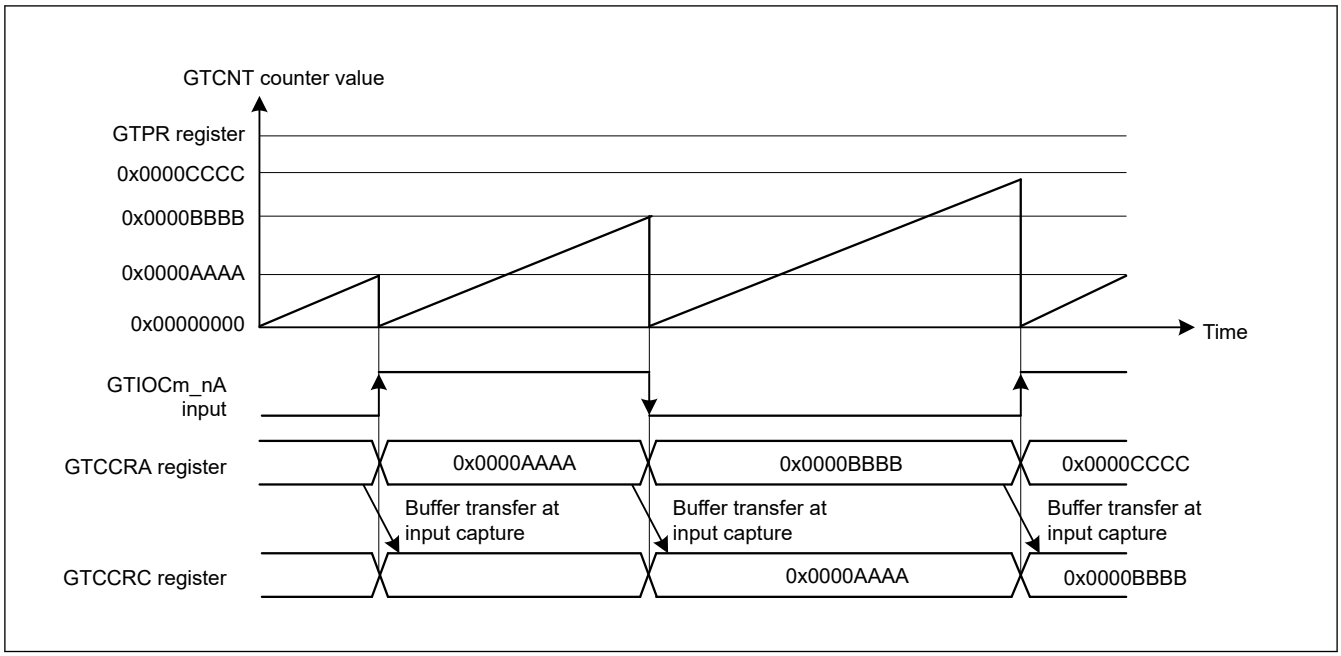

Figure 20.16 Example of buffer operation of the GTCCRA and GTCCRB registers (counting up to produce a sawtooth wave, and clearing the GTCNT counter and input capture on both edges of the input on the GTIOCm_nA pin) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

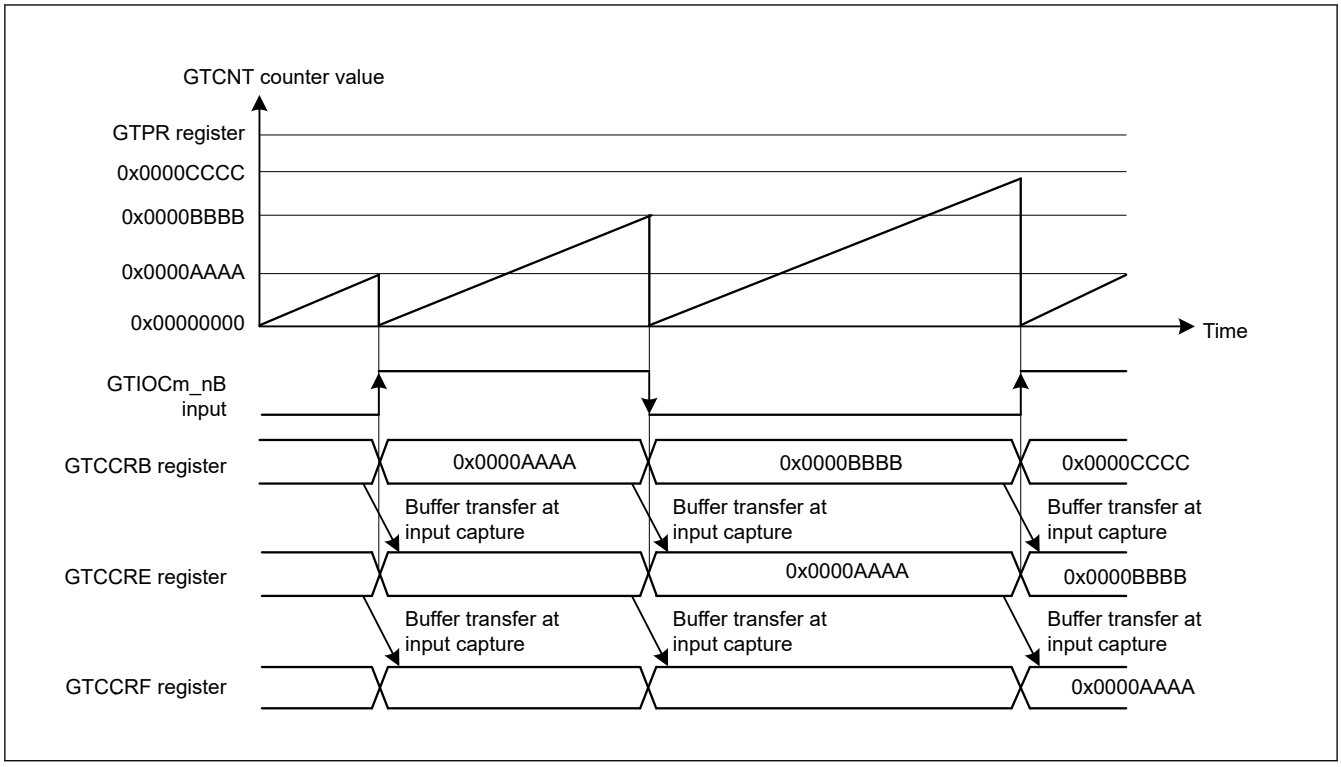

Figure 20.17 Example of double buffer operation of the GTCCRA and GTCCRB registers (counting up to produce a sawtooth wave, and clearing the GTCNT counter and input capture on both edges of the input on the GTIOCm_nB pin) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

The following example shows setting for buffer operation of the GTCCRA and GTCCRB registers for input capture.

1. Set operating mode and counter clear source
   Set the operating mode with GTCR.MD[2:0] and counter clear source with the GTCSR register. In Figure 20.16, MD[2:0] = 000b (sawtooth-wave PWM mode) and GTCSR register = 0x00000F00 and in Figure 20.17, MD[2:0] bits = 000b (sawtooth-wave PWM mode) and GTCSR register = 0x0000F000.
2. Select count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.16, the lower 2 bits of GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set input capture source
   Select input capture sources with the GTICASR and GTICBSR registers. In Figure 20.16, GTICASR register = 0x00000F00 and in Figure 20.17, GTICBSR register = 0x0000F000.
7. Set buffer operation
   Set buffer operation with the GTBER.CCRA[1:0] bits and CCRB[1:0] bits.
   In Figure 20.16, CCRA[1:0] bits = 01b and in Figure 20.17, CCRB[1:0] bits = 1xb.
8. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

20.4.2.3 Buffer Operation for the GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can

function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b. The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode.

In sawtooth-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in section 20.4.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

Figure 20.18 to Figure 20.20 show examples of buffer operation of the GTADTRA and GTADTRB registers.

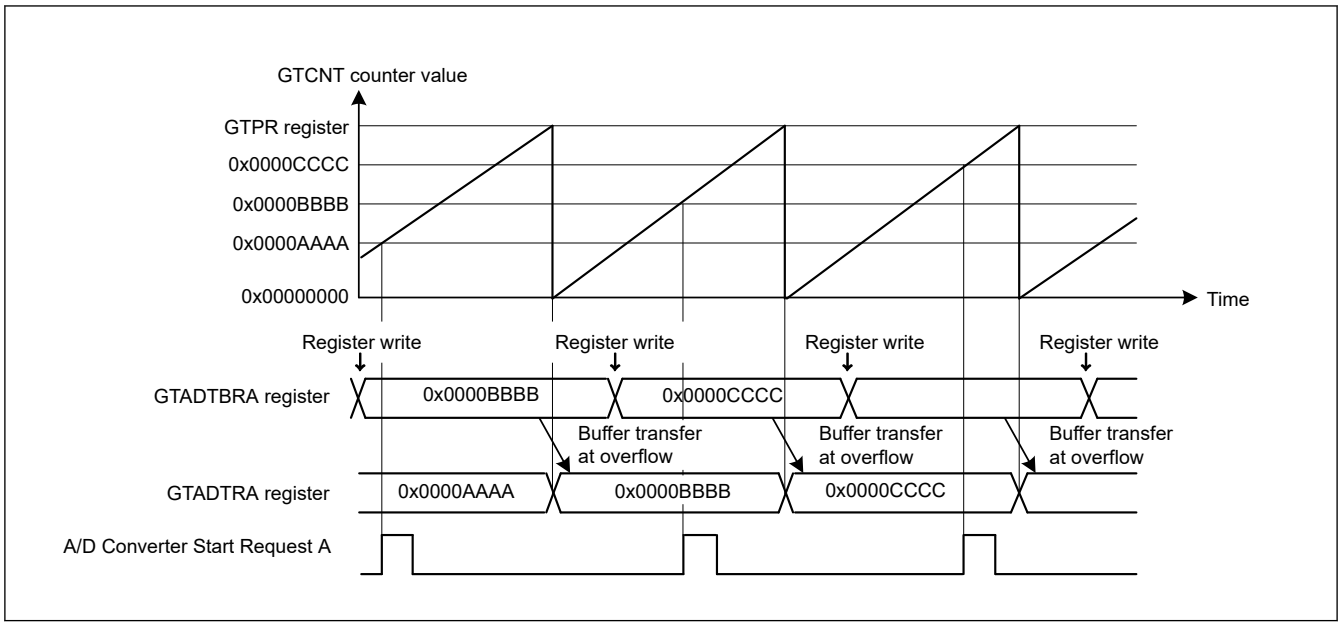

Figure 20.18 Example of buffer operation of the GTADTRA and GTADTRB registers (sawtooth waves in up-counting, A/D converter start request generated by up-counting)

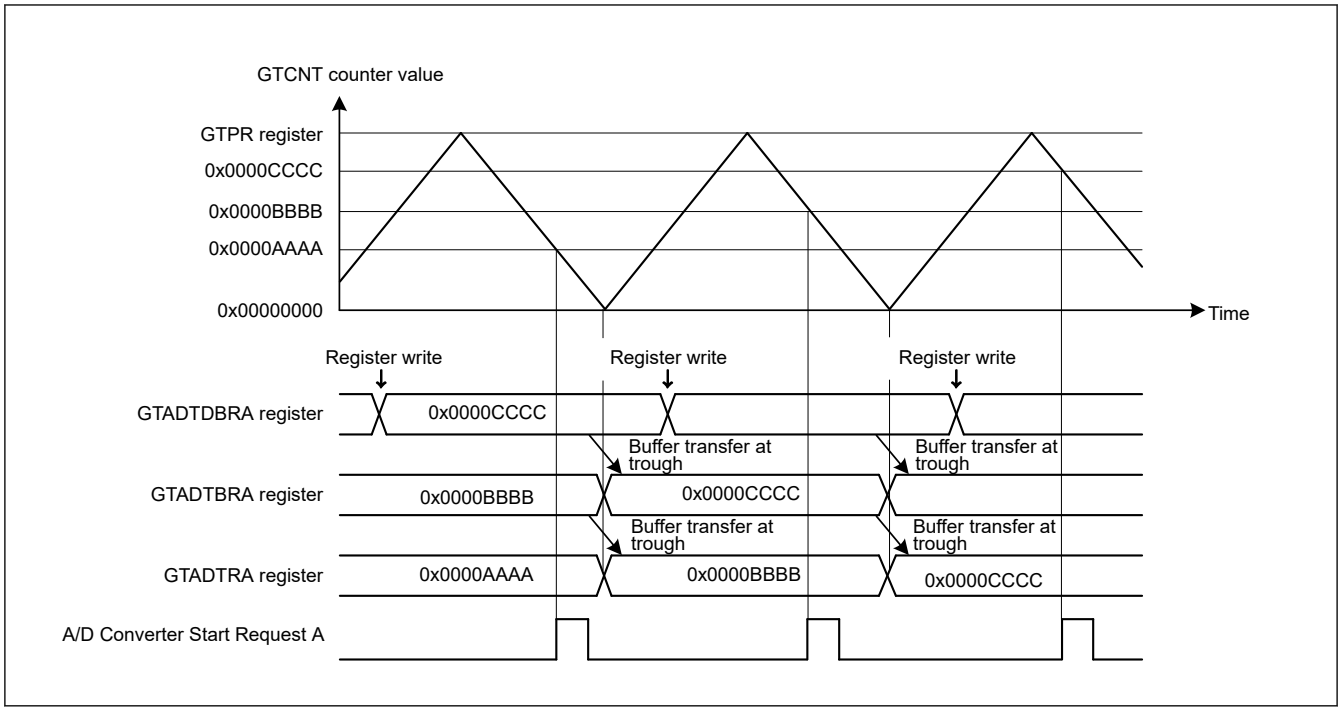

Figure 20.19 Example of double buffer operation of the GTADTRA and GTADTRB registers (triangle waves, buffer transfer at troughs, A/D converter start request generated by down-counting)

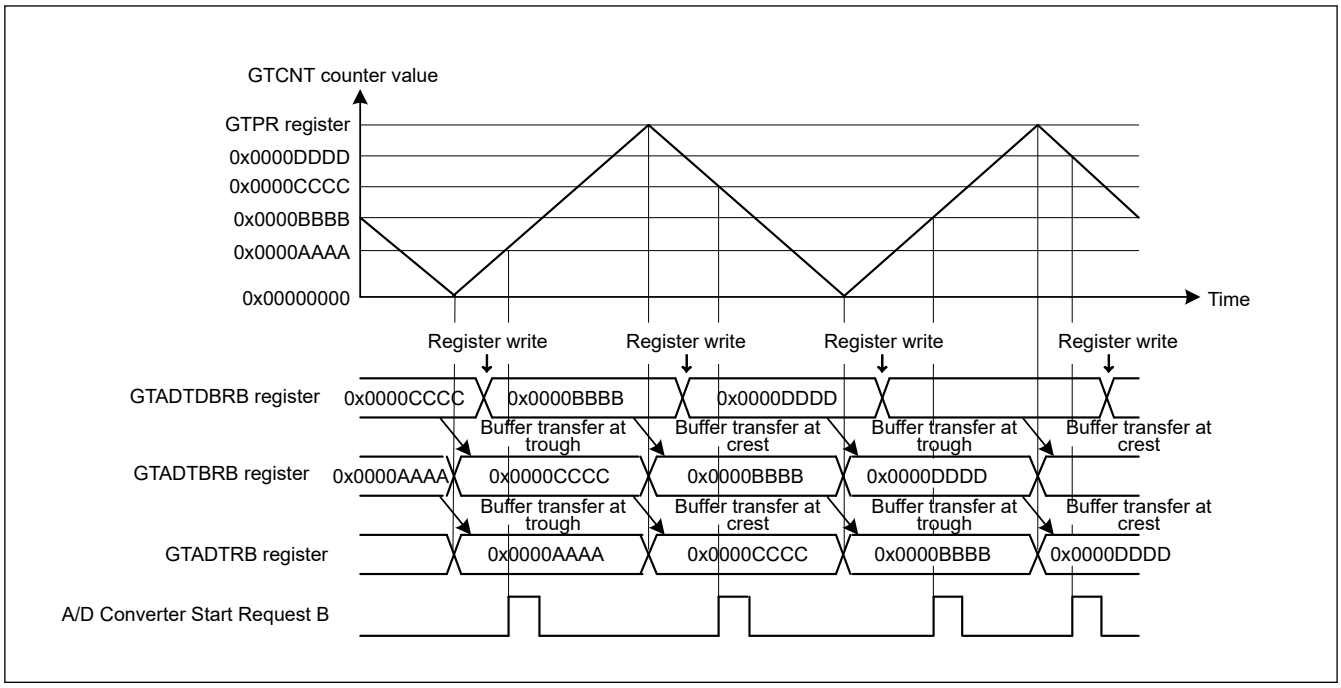

Figure 20.20 Example of double buffer operation of the GTADTRA and GTADTRB registers (triangle waves, buffer transfer at both troughs and crests, A/D converter start request generated by both up-counting and down-counting)

The following example shows setting for buffer operation of the GTADTRA and GTADTRB registers.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.18, 000b (sawtooth-wave PWM mode) is set, and in Figure 20.19 and Figure 20.20, 100b, 101b, or 110b (triangle-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.

In Figure 20.18, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set buffer operation
   Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTBER register. In Figure 20.18, ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0. In Figure 20.19, ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 20.20, ADTTB[1:0] bits = 11b and ADTDB bit = 1.
7. Set compare match value
   Set the A/D converter start request point in the GTADTRA and GTADTRB registers.
8. Set buffer value
   For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D converter start request points in two cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
9. Enable A/D converter start request
   Set the enable A/D converter start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. In Figure 20.18, ADTRAUEN bit = 1, in Figure 20.19, ADTRADEN bit = 1, and in Figure 20.20, ADTRBUEN bit = 1 and ADTRBDEN bit = 1 .
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value for each cycle
    For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, set the A/D converter start request points in two cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

20.4.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCm_nA pin or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) by a compare match between the GTCNT counter and the GTCCRA or GTCCRB register.

By setting the GTDTCR, GTDVU, and GTDVD registers, the compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

(1) Sawtooth-Wave PWM Mode

In sawtooth-wave PWM mode, the GTCNT counter performs sawtooth-wave (half-wave) operation by setting the period in the GTPR register and a PWM waveform is output to the GTIOCm_nA or GTIOCm_nB pin when a GTCCRA or GTCCRB register compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

Figure 20.21 shows an example of sawtooth-wave PWM mode operation.

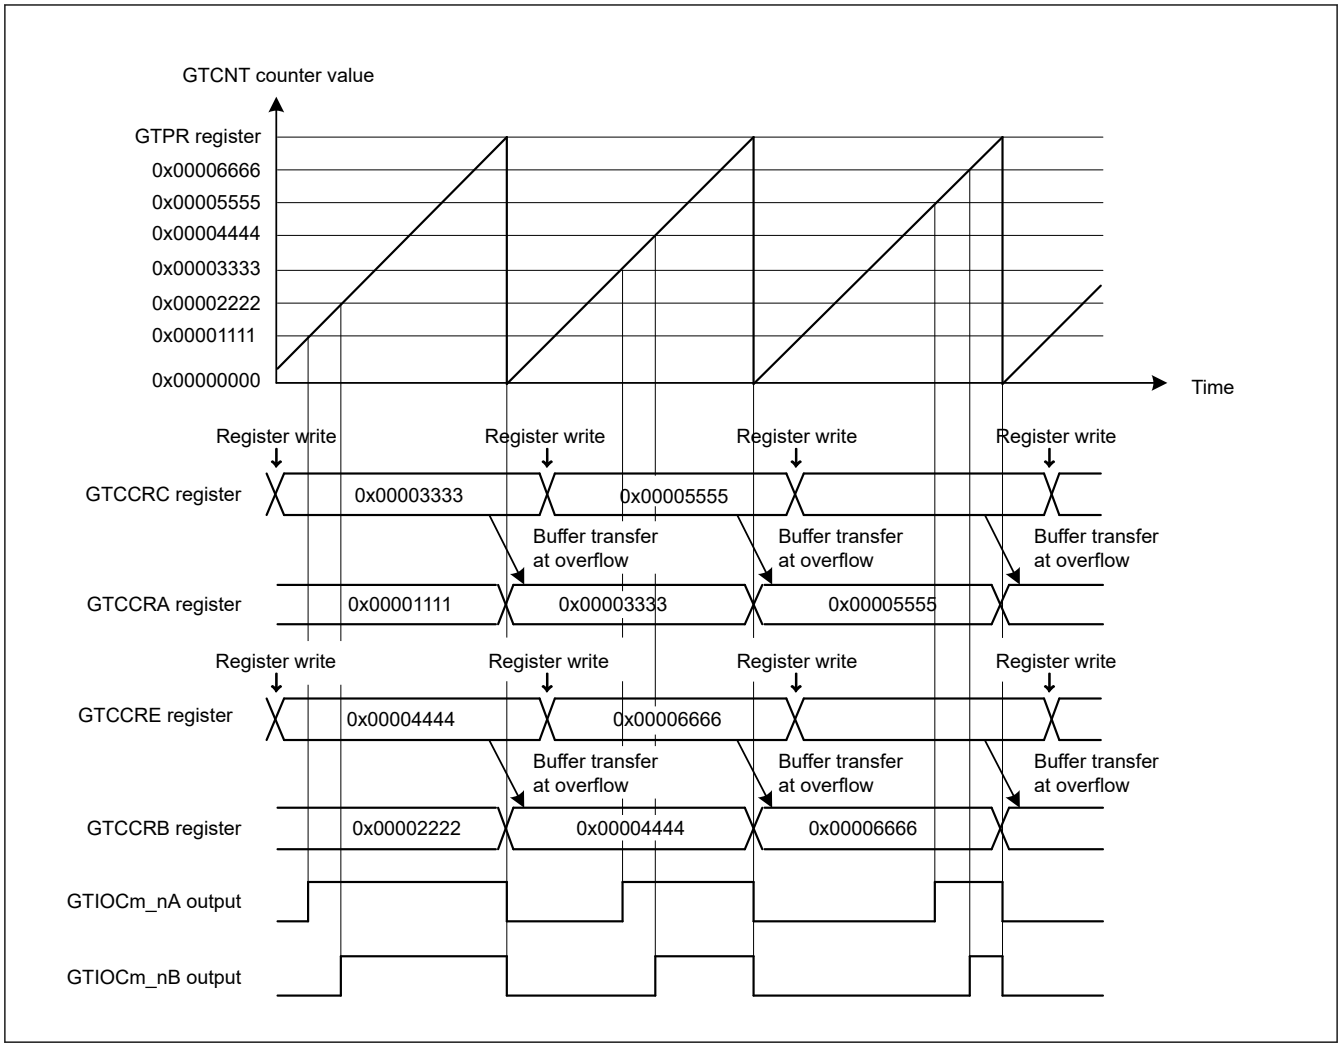

Figure 20.21 Example of sawtooth-wave PWM mode operation (up-counting, buffer operation, high output at GTCCRA/GTCCRB register compare match, low output at the end of the cycle) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

The following example shows setting for sawtooth-wave PWM mode.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.21, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.21, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.21, GTIOA[4:0] bits = 00110b and GTIOB[4:0] bits = 00110b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer operation

Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register.
In Figure 20.21, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.

9. Set compare match value
   Set the GTIOCm_nA pin changing point in the GTCCRA register and the GTIOCm_nB pin changing point in the GTCCRB register.
10. Set buffer value
    For buffer operation, set the GTIOCm_nA and the GTIOCm_nB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value for each cycle
    For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing point in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

(2) Sawtooth-Wave One-Shot Pulse Mode

The sawtooth-wave one-shot pulse mode is a mode in which the period is set in the GTPR register, the GTCNT counter performs sawtooth-wave (half-wave) operation and a PWM waveform is output to the GTIOCm_nA or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed.

Buffer operation in sawtooth-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following registers:

- GTCCRC register to GTCCRA register at the end of the cycle
- GTCCRE register to GTCCRB register at the end of the cycle
- GTCCRD register to temporary register A at the end of the cycle
- GTCCRF register to temporary register B at the end of the cycle
- Temporary register A to GTCCRA register at a GTCCRA register compare match
- Temporary register B to GTCCRB register at a GTCCRB register compare match

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the end of the cycle according to the GTIOR register setting.

The temporary register A and the temporary register B can perform forcible buffer transfer from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B respectively by writing 1 to the GTBER.CCRSW bit while the count is stopped.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm register is repeated on a cyclic basis by using the temporary register x (x = C, E) and temporary register m which operate as intermediate buffers for the GTCCRx and GTCCRm registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see section 20.9.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 20.22 shows an example of sawtooth-wave one-shot pulse mode operation.

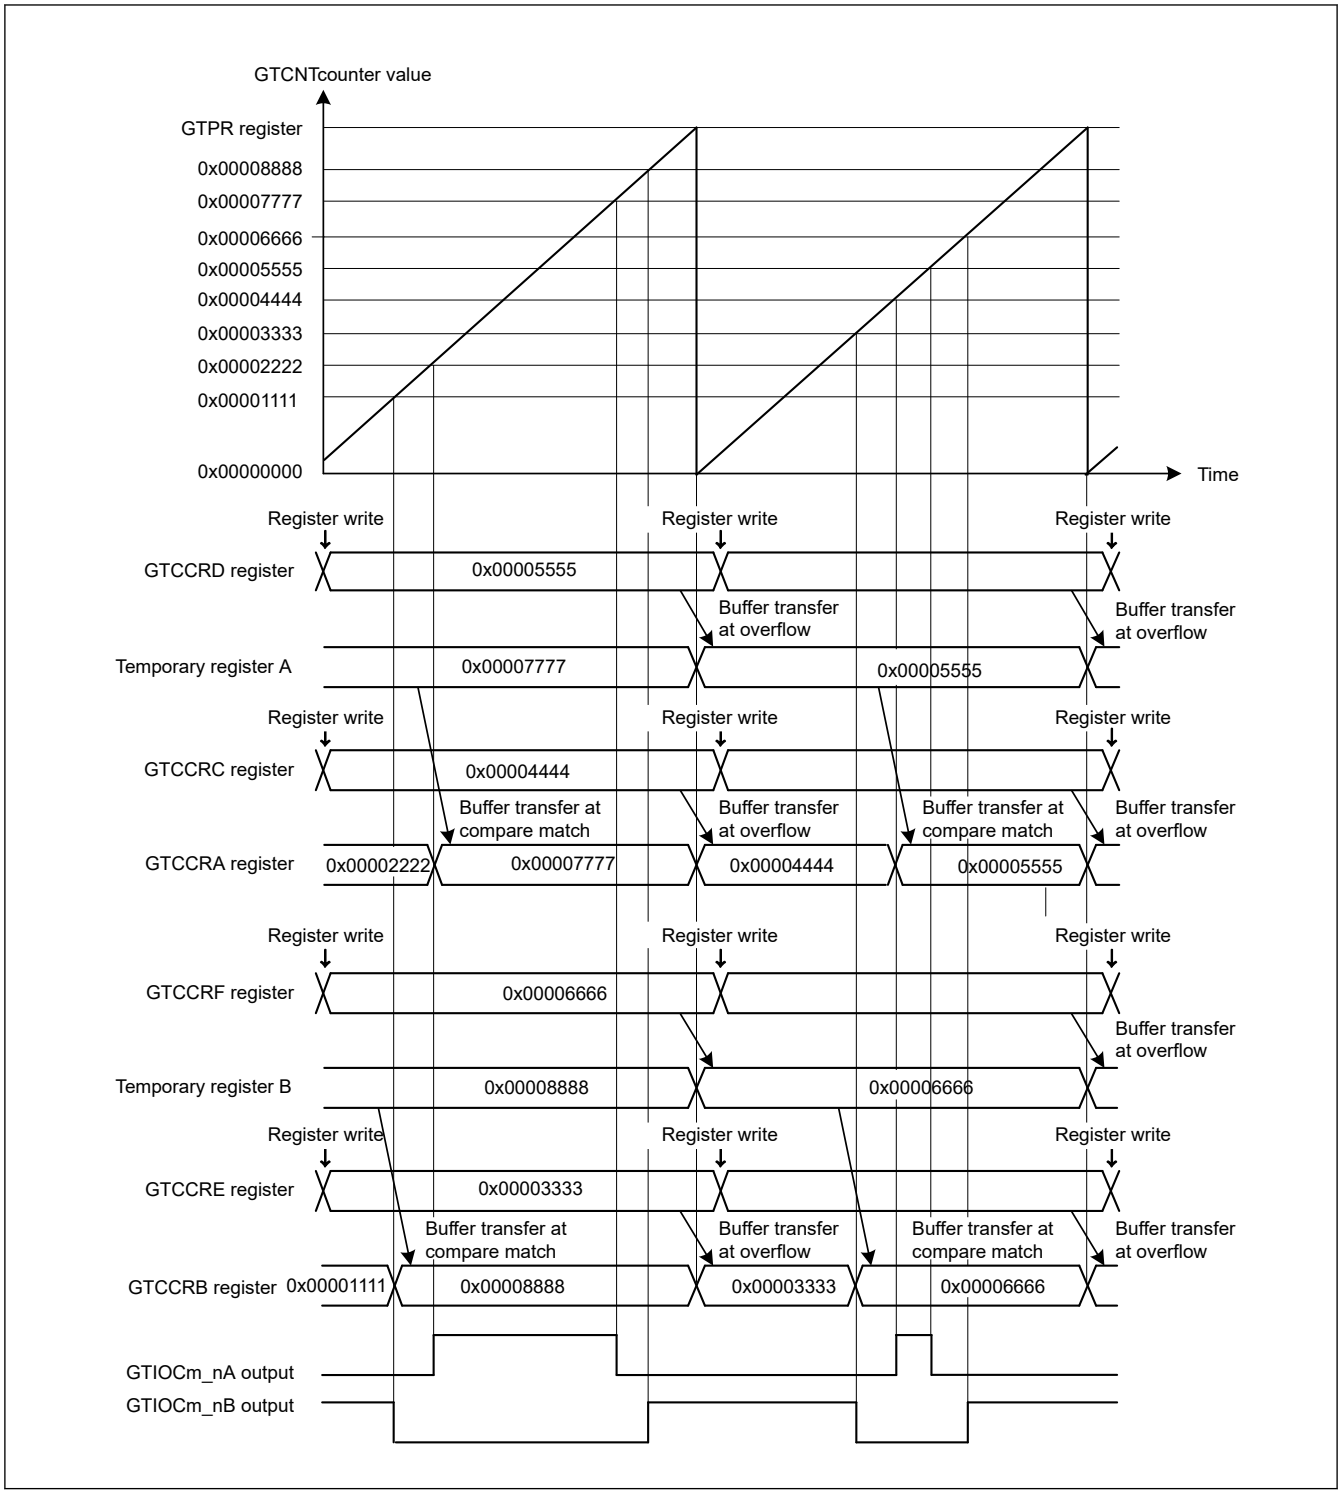

Figure 20.22 Example of sawtooth-wave one-shot pulse mode operation (up-counting, low output from the GTIOCm_nA pin and high output from the GTIOCm_nB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle)

The following example shows setting for sawtooth-wave one-shot PWM mode.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits. In Figure 20.22, 001b (sawtooth-wave PWM one-shot mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 20.22, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.22, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer value
   Set the GTIOCm_nA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCm_nB pin changing point in the GTCCRE and GTCCRF registers.
9. Set forcible buffer transfer
   Set the GTBER.CCRSWT bit to 1 to forcibly transfer buffer register data.
10. Set buffer value
    For buffer operation, set the GTIOCm_nA pin changing point for the next cycle from the current cycle to the GTCCRC and GRCCRD registers, and set the GTIOCm_nB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.
11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value by cycle
    For buffer operation, set the GTIOCm_nA pin changing point for next cycle from the current cycle to the GTCCRC and GTCCRD registers and set the GTIOCm_nB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

(3) Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCm_nA or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) when a GTCCRA or GTCCRB register compare match occurs.

Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

Figure 20.23 shows an example of triangle-wave PWM mode 1 operation.

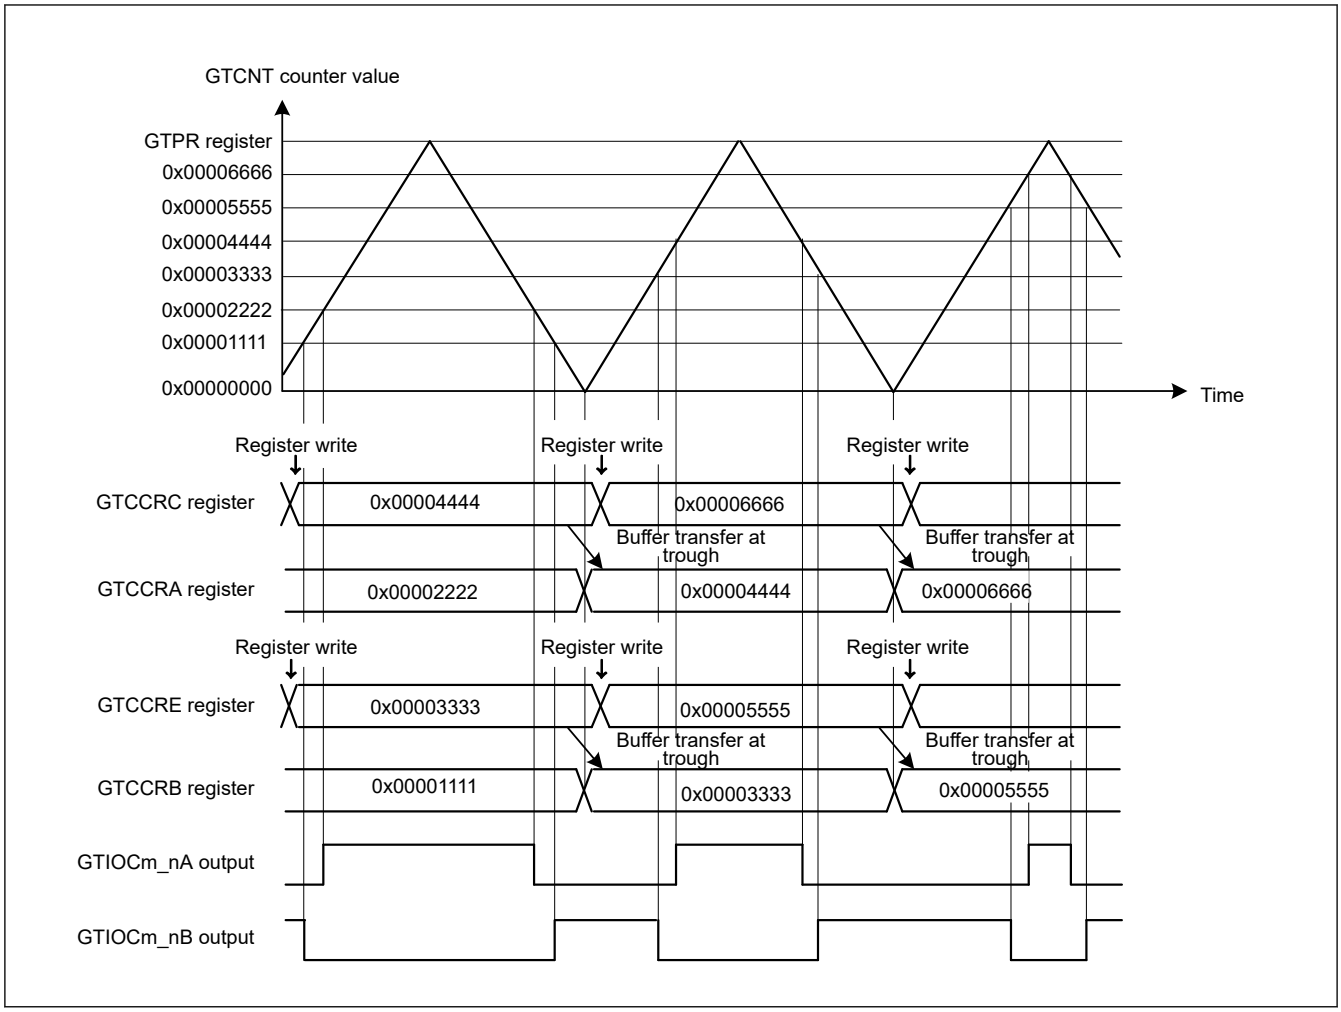

Figure 20.23 Example of triangle-wave PWM mode 1 operation (buffer operation, low output from the GTIOCm_nA pin and high output from the GTIOCm_nB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

The following example shows setting for triangle-wave PWM mode 1.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.23, 100b (triangle-wave PWM mode 1) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.23, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation
   Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in the GTBER register.
   In Figure 20.23, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.
8. Set compare match value

Set the GTIOCm_nA pin changing point in the GTCCRA register and GTIOCm_nB pin changing point in the GTCCRB register.

9. Set buffer value
   For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by cycle
    For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

(4) Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2, the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCm_nA or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) when a GTCCRA or GTCCRB register compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

Figure 20.24 shows an example of triangle-wave PWM mode 2 operation.

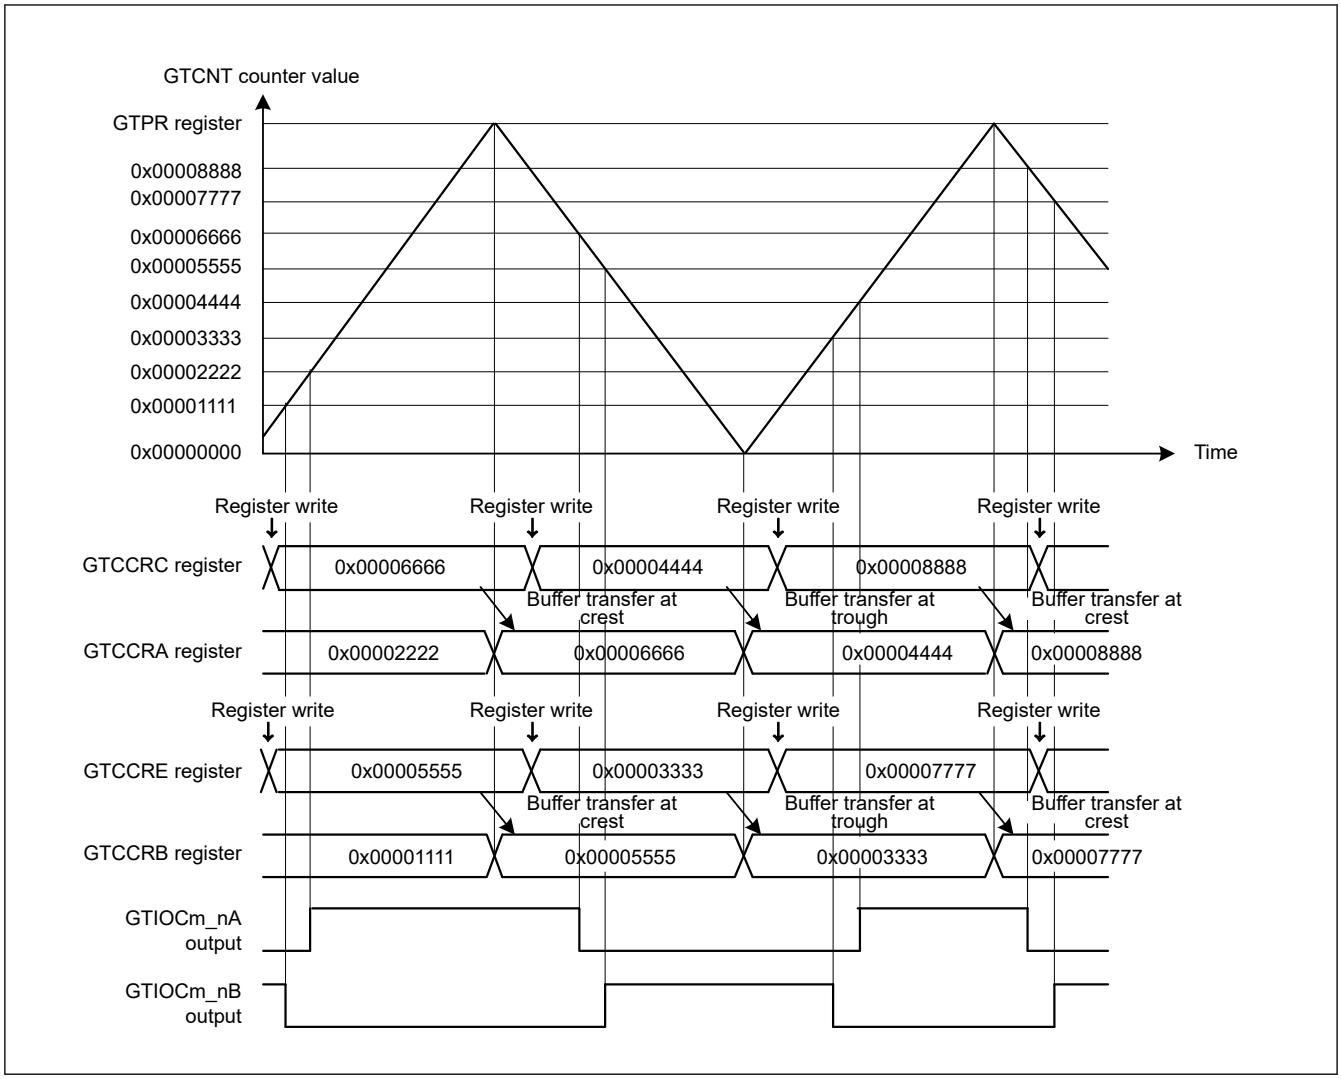

Figure 20.24 Example of triangle-wave PWM mode 2 operation (buffer operation, low output from the GTIOCm_nA pin and high output from the GTIOCm_nB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

The following example shows setting for triangle-wave PWM mode 2.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.24, 101b (triangle-wave PWM mode 2) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 20.24, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation

Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 20.24, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.

8. Set compare match value
   Set the GTIOCm_nA pin changing point in the GTCCRA register and GTIOCm_nB pin changing point in the GTCCRB register.
9. Set buffer value
   For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
   For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by half cycle
    For buffer operation, set the GTIOCm_nA pin and GTIOCm_nB pin changing points in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, also set the GTIOCm_nA pin and GTIOCm_nB pin changing points in one cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

(5) Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCm_nA or GTIOCm_nB pin ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)) at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following registers:

- GTCCRC register to GTCCRA register at the trough
- GTCCRE register to GTCCRB register at the trough
- GTCCRD register to temporary register A at the trough
- GTCCRF register to temporary register B at the trough
- Temporary register A to GTCCRA register at the crest
- Temporary register B to GTCCRB register at the crest

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see section 20.9.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 20.25 shows an example of triangle-wave PWM mode 3 operation.

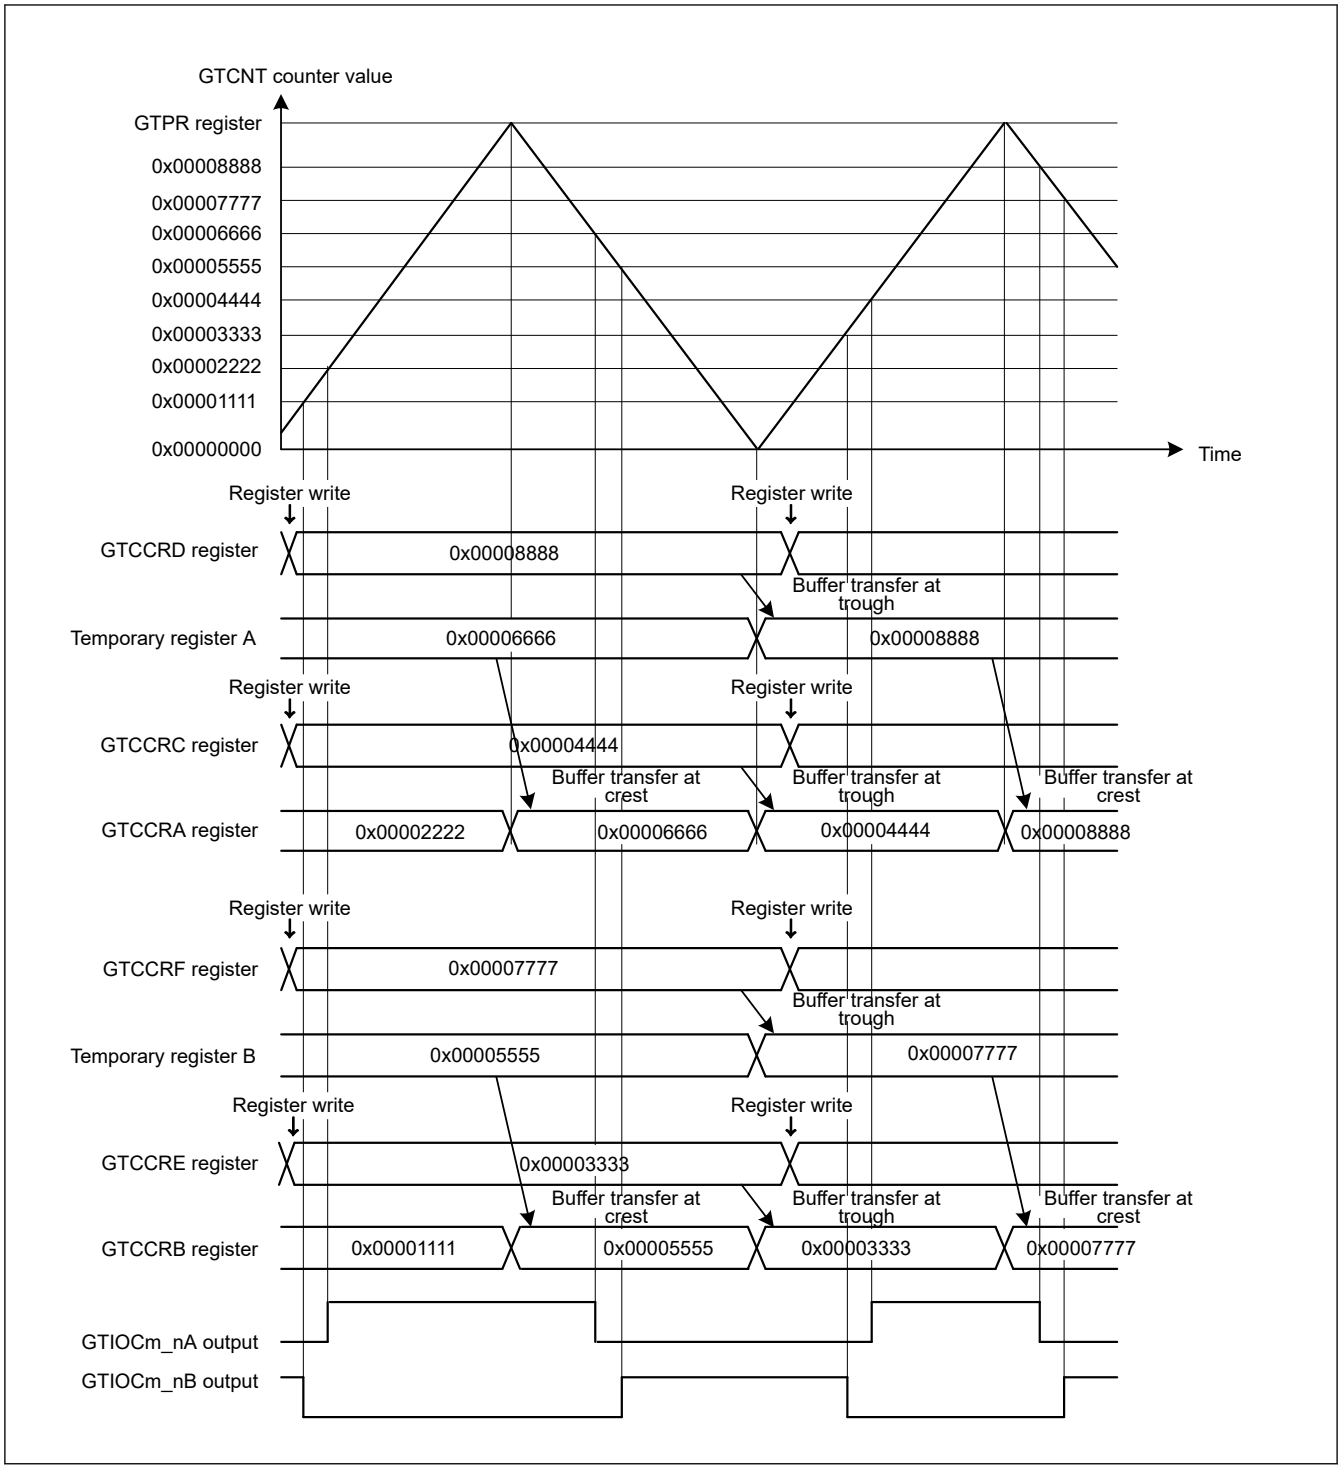

Figure 20.25 Example of triangle-wave PWM mode 3 operation (low output from the GTIOCm_nA pin and high output from the GTIOCm_nB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

The following example shows setting for triangle-wave PWM mode 3.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.25, 110b (triangle-wave PWM mode 3) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting

Set a period in the GTPR register.

4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.25, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer value
   Set the GTIOCm_nA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCm_nB pin changing point in the GTCCRE and GTCCRF registers.
8. Set forcible buffer transfer
   Set the GTBER.CCRSWT bit to 1 to forcibly transfer buffer register data.
9. Set buffer value
   For buffer operation, set the GTIOCm_nA pin changing point for the next cycle from the current cycle to the GTCCRC and GRCCRD registers, and set the GTIOCm_nB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by cycle
    For buffer operation, set the GTIOCm_nA pin changing point for next cycle from the current cycle to the GTCCRC and GTCCRD registers and set the GTIOCm_nB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

20.4.4 Automatic Dead Time Setting Function

By setting the GTDTCR register, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (the GTCCRA register value) and specified dead time values (the GTDVU and GTDVD registers values) can automatically be set to the GTCCRB register.

The automatic dead time setting function can be used in sawtooth-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in the GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

The GTDBU register can be used as a buffer register of the GTDVU register, and the GTDBD register can be used as a buffer register of the GTDVD register. Buffer transfer is performed at the end of the cycle (in sawtooth-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing in triangle-wave mode: a trough).

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to the GTCCRB register is prohibited when the automatic dead time setting function is used.

Do not set the dead-time that makes the change point of the waveform exceeding the count period. When a dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in Table 20.10. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to determine the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In sawtooth-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

In triangle-wave PWM mode, if dead-time exceeds the count period by setting 0x00000000 or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register, output change is controlled by the output protection function (see section 20.9.4. GTIOCm_nA and GTIOCm_nB Protection Function for GTIOCm_nA and GTIOCm_nB Pin

Output ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))). When GTCCRA register is greater than or equal to [GTPR register + GTDVm (m = U, D) register], [GTPR register − 1] is set in the GTCCRB register as the upper limit.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it can also be done at the next count clock from the current crest.

Table 20.10 Adjustment of the waveform change point when a dead-time error occurs

Mode	Count direction	Period	Condition for dead-time error	Change point of the positive-phase waveform after adjustment	Change point of the negative-phase waveform after adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	GTCCRA − GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR	GTPR − GTDVD	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR − GTDVU	GTPR
		Second half	GTCCRA − GTDVD < 0	GTDVD	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA − GTDVU ≤ 0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA − GTDVD < 0	GTDVD	0

Figure 20.26 to Figure 20.28 show examples of automatic dead time setting function operation.

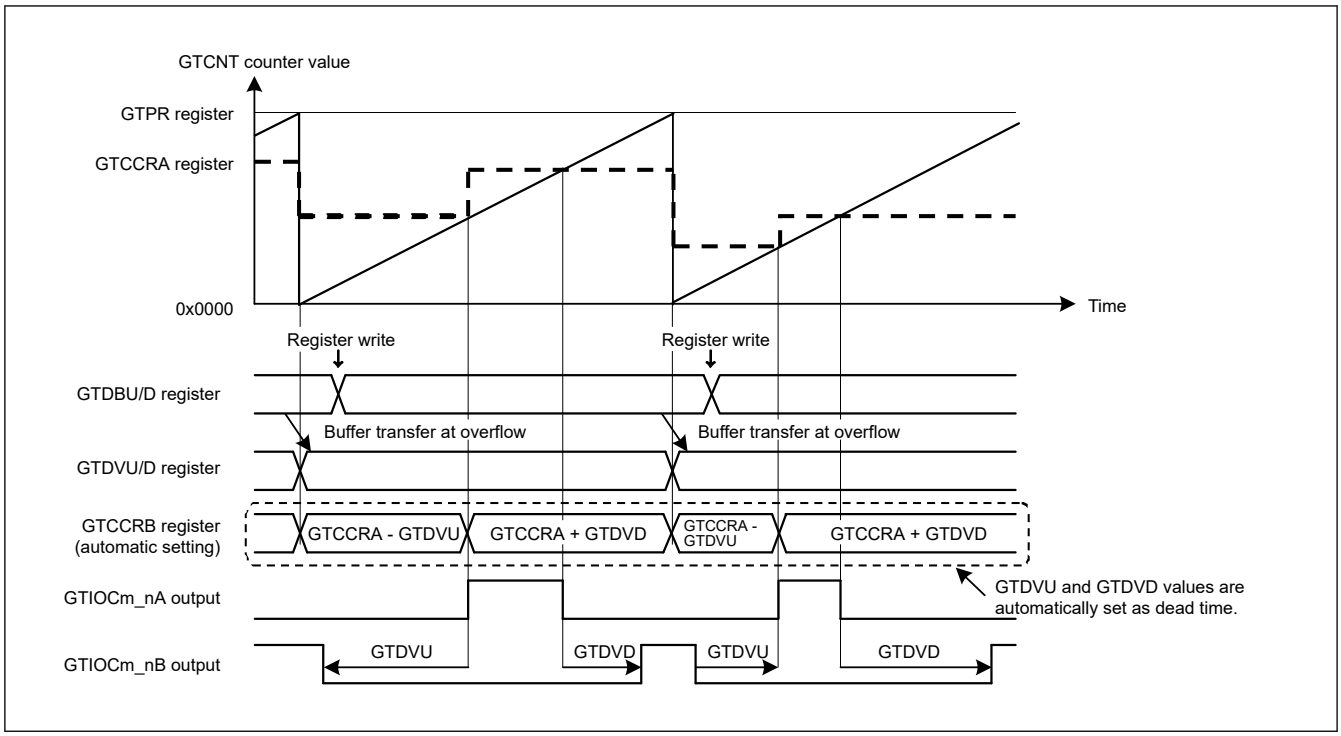

Figure 20.26 Example of automatic dead time setting function operation (sawtooth-wave one-shot pulse mode, up-counting, GTDVU and GTDVD registers set to buffer operation, active-level: high) ((m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3))

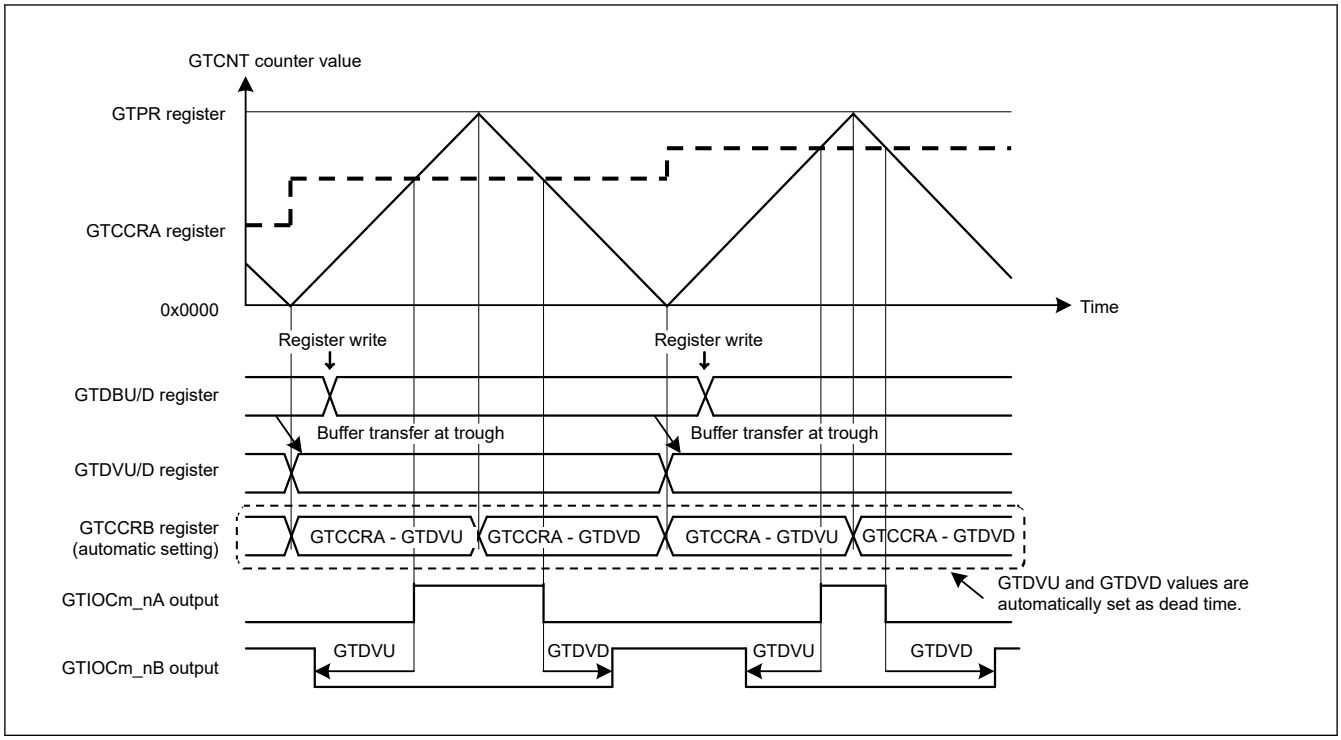

Figure 20.27 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 1, GTDVU and GTDVD registers set to buffer operation, active-level: high)

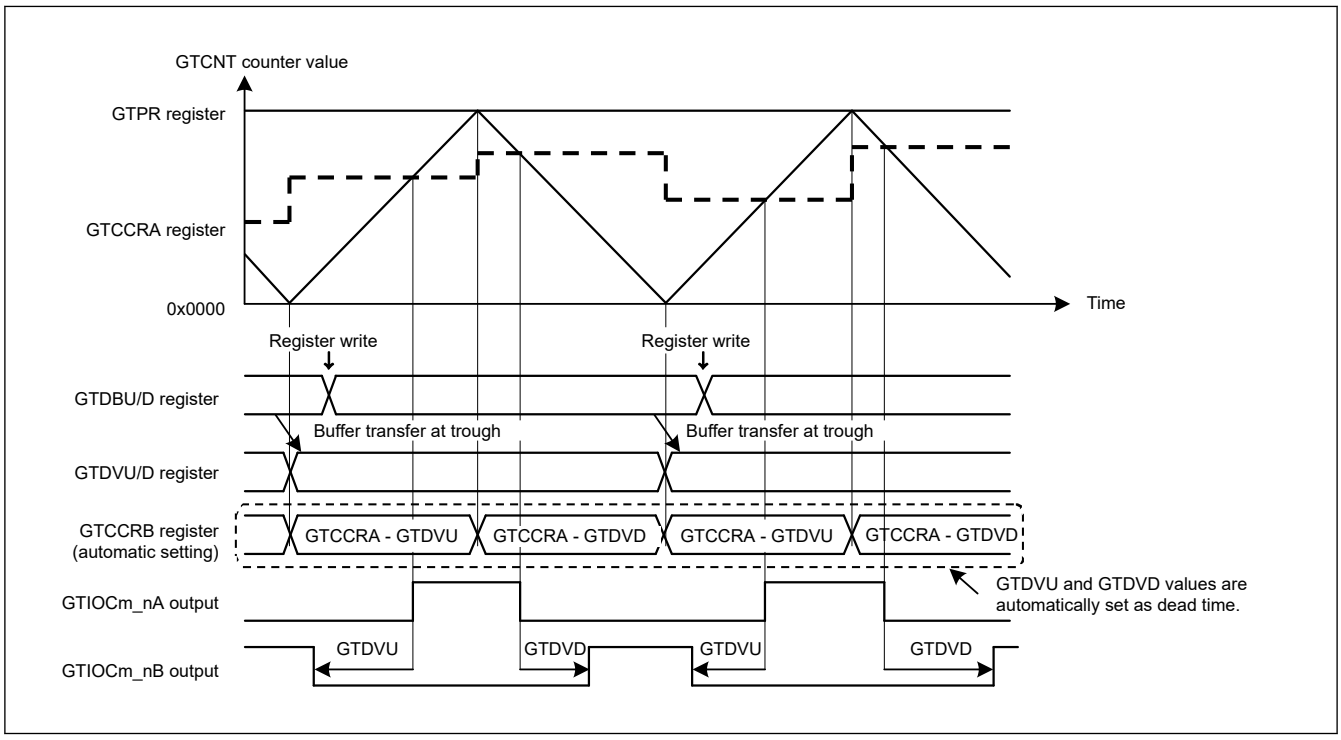

Figure 20.28 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 2 or 3, GTDVU and GTDVD registers set to buffer operation, active-level: high)

The following example shows setting for automatic dead time setting function (sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3).

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.26, 001b (sawtooth-wave one-shot pulse mode) is set. In Figure 20.28, 110b (triangle-wave PWM mode 3) is set.

2. Select count direction
   Select the count direction (up or down) with the GTUDDTYC register. In Figure 20.26, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.26 and Figure 20.28, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
7. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer value for compare match
   Set the GTIOCm_nA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers.
9. Set forcible buffer transfer for compare match
   Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly to the GTCCRA register.
10. Set buffer value for compare match
    Set the GTIOCm_nA pin changing point in one cycle after the count start in the GTCCRC and GTCCRD registers.
11. Set automatic dead time setting function
    Set GTDTCR.TDE to 1 to enable the automatic dead time setting function.
12. Set buffer operation for dead time setting
    Set buffer operation with the TDBUE and TDBDE bits in the GTDTCR register.
13. Set dead time value
    Set the first half dead time value in the GTDVU register and the second half dead time in the GTDVD register. When the GTDVU register is set with the GTDTCR.TDFER bit set to 1, the same value is also set to the GTDVD register, the same dead time value can be set for the first and second halves.
14. Set buffer value for dead time
    For buffer operation, set the first half dead time in one cycle after the current cycle in the GTDBU register and the second half dead time in the GTDBD register.
15. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
16. Set buffer value by cycle
    Set the GTIOCm_nA pin changing point for the next cycle from the current cycle to the GTCCRC and GTCCRD registers.
    When the dead time register is used for buffer operation, set the dead time value in the first half of the next cycle from the current cycle to the GTDBU register and the dead time value in the second half to the GTDBD register.

Note: (m = 00 to 08 and n = 0 to 4), (m = 09 and n = 0 to 6), or (m = 10 and n = 0 to 3)

The following example shows setting for automatic dead time setting function (triangle-wave PWM mode 1 or 2).

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 20.27, 100b (triangle-wave PWM mode 1) is set.
   In Figure 20.28, 101b (triangle-wave PWM mode 2) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter

Set the initial value in the GTCNT counter.

5. Set GTIOCm_nA and GTIOCm_nB pin function
   Set the GTIOCm_nA and GTIOCm_nB pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 20.27 and Figure 20.28, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCm_nA and GTIOCm_nB pin output
   Set to enable the GTIOCm_nA and GTIOCm_nB pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation for compare match
   Set buffer operation with the GTBER.CCRA[1:0] bits.
8. Set the value for compare match
   Set the GTIOCm_nA pin changing point to the GTCCRA register.
9. Set buffer value for compare match
   For buffer operation, set the GTIOCm_nA pin changing point in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCm_nA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD register.
10. Set automatic dead time setting function
